THE PENNY CYCLOPÆDIA

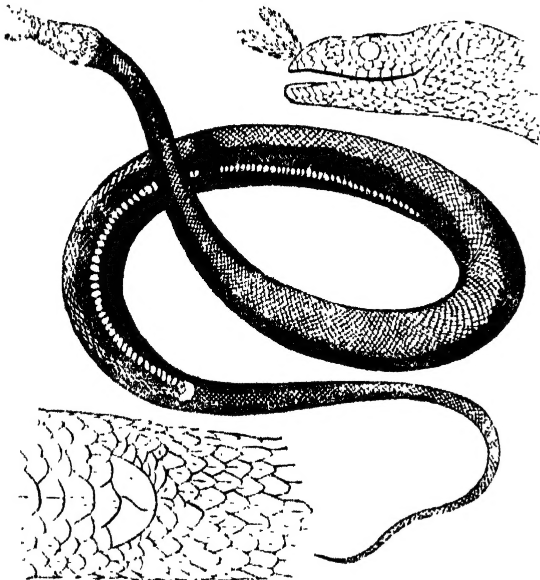
OF

THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

ERNESTI, JOHN AUGUSTUS, was born at Tennstadt, in the Thüringer Wald, on the 4th August, 1707. He was educated at Wittenberg and Leipzig, and became conrector of the school of St. Thomas, in the latter city, in the year 1731. He succeeded J. M. Gessner as rector in 1734. While engaged in this situation he acquired a great reputation as a classical scholar; so much so, that in 1742 the University of Leipzig violated its own rule of never electing to any professorship the master of a school, and appointed him professor extraordinary of antient literature. He was made professor of eloquence in 1756, and professor of theology, with the degree of Dr., in 1758: he held the two last named professorships together till 1770, when he gave up the former to his nephew, Augustus William. He died on the 11th September, 1781. Ernesti was a man of considerable abilities, and especially of a very methodical mind, to which are due the great improvements in the system of teaching introduced by him, and still, to a certain extent, adopted in the German universities. He was well acquainted with the classics, and no mean proficient in theological learning. His Latin style is very elegant for a German, little inferior indeed to that of Ruhnken, and fully equal to that of Wyttenbach: a good specimen of his Latinity may be seen in A. Matthiä's *Eloquentia Latina*. His knowledge of Greek, though less accurate, was still very respectable. The work for which he is best known is his edition of Cicero, which has been made the basis of all subsequent ones. The third and last edition of this author published by him was printed at Halle in 1775. His *Clavis Ciceroniana*, or Index of words and subjects to Cicero's works, is still in general use. Besides his Cicero, Ernesti's *Initia Doctrinæ Solidioris* and *Institutio Interpretis Novi Testamenti* are much esteemed by students at the present day; the latter has been recently translated into English. The edition of Homer which Ernesti published in 1759-65 is merely an improved reprint of the hackneyed edition by Dr. Clark. It was republished by Dindorf in 1824. His edition of Callimachus, which appeared in 1761, is suspected to have owed a good deal of what is valuable in it to the contributions of Ruhnken. An account of it is given in the 'Museum Criticum,' vol. ii., p. 151. Ernesti's editions of Polybius, Tacitus, and Suetonius, have been quite superseded by those of Schweighäuser, Bekker, and F. A. Wolf.

ERNESTI, AUGUSTUS WILLIAM, nephew of the preceding, was born at Frohndorf, near Tennstadt, the 26th November, 1733. He was a pupil of his uncle at Leipzig, was made professor of philosophy there in 1765, and, as has been mentioned, succeeded, on his uncle's resignation, to the professorship of eloquence (in 1770). He died of apoplexy on the 29th July, 1801. He was principally distinguished as a very good Latin scholar. His best known work is an edition of Livy, with a very copious glossary, which was reprinted twice in his lifetime; the third edition was in the press when he died, and was completed by Schäfer.

ERNESTI, JOHN CHRISTIAN THEOPHILUS, also a nephew of John Augustus, was born at Arnstadt, in the Thüringer Wald, in 1756. He was professor of philosophy in the University of Leipzig from 1782 to 1801, when he succeeded his cousin, Augustus William, as professor of eloquence. He died on the 5th June in the following year. This scholar published editions of Silius Italicus and Æsop; *Lexicon Technologiæ Græcæ Rhetoricæ*, Lips. 1795; *Lex. Techn. Romanorum Rhetoricæ*, Lips., 1797 (both very useful works); *Hesychii Glossæ Sacræ*, 1785; *Suidæ et Phavorini Glossæ Sacræ*, 1786; a translation into German of Du mesnil's Latin Synonyms, and a German version of the principal works of Cicero. (Cicero's *Geist* and *Kern*, 1799-1802.)



ERPE'NIUS. The celebrated orientalist, Thomas Erpenius, or Thomas van Erpen, was born at Gorcum, on the 7th of September, 1584. At the age of ten years he was sent to Leyden, where he received his education; and in 1608 he took the degree of Master of Arts in the university of that town. He had studied chiefly theology and oriental literature, and after the termination of his academic education, he undertook a tour to England, France, Italy, and Germany, for the farther prosecution of his favourite pursuits. At Paris he became acquainted with Isaac Casaubonus, and availed himself of the Arabic instructions of a learned Maronite, Joseph Barbatus, then a resident in the French capital. Erpenius returned to his native country in 1612, and was in the following year appointed professor of Oriental languages in the university of Leyden, an office to which was added subsequently that of Arabic interpreter to the Netherlands. On two occasions, in 1620 and 1621, he was sent to Paris on business of the university of Leyden. With these interruptions he seems to have devoted himself exclusively to the cultivation of Oriental literature. He established an Arabic press at his own house, and employed himself in editing a number of works, which have been of the greatest utility in promoting the cause of Oriental learning. He died of a contagious disease at the age of forty, November 13th, 1624. The work which has contributed most to give celebrity to the name of Erpenius is his 'Grammatica Arabica, quinque libris methodice explicata,' published at Leyden in 1613, 4to. It has often been re-edited with additions and alterations, and has become the foundation of nearly every subsequent Arabic grammar printed in Europe down to that of Silvestre de Sacy. The most remarkable of Erpenius's other publications are the following: 'Proverbiorum Arabicorum centuriæ duæ,' Leyden, 1614 and 1623, 8vo.; 'Locmani Sapientis Fabulæ et selecta quædam Arabum Adagia,' Leyden, 1615, 8vo.: an edition of an Arabic version of the New Testament and of the Pentateuch, the former published in 1616, the latter in 1622; an edition of the chronicle of Elmakin, with a

[illegible] translation, published after his death, under the title '[illegible] Historia Saraconica,' Leyden, 1625, fol.; two original [illegible] Arabic grammar, bearing the title, 'Grammatica Arabica, dicta Giarumia, et libellus centum Regentium,' Leyden, 1617, 4to.; and a Hebrew Grammar, 'Grammatica [illegible] generalis,' Leyden, 1621, 8vo.

ERPETOLOGY. [HERPETOLOGY.]

ERPETON, Lacépède's name for a genus of serpents placed by Cuvier next to *Eryx*. The name should be written *Herpeton*.

The genus is furnished with two soft prominences, covered with scales, on the muzzle. The head is protected by large plates; those beneath the belly are not large, and those beneath the tail scarcely differ from the other scales. The tail however is very long and pointed. Cuvier, who speaks of the priority of Lacépède, who first described the genus under the name of *Erpeton*, remarks that Merrem has changed the name to *Rhinopirus*.

Herpeton tentaculatus.

ERRATIC BLOCKS are those weather-worn and more or less rounded fragments of the harder rocks which are found very widely scattered over the surface of the earth, and at great distances from the places whence they are supposed to be derived.

In size they vary from ten thousand cubical feet and upwards to a few inches. M. Brongniart has proposed to designate the several sizes by particular names, as gigantic, metric, cephallary, pugillary, &c. But in England we generally confine the term erratic blocks to the larger masses, calling those of middling size boulders, and arranging the smaller along with gravel: this is, however, too vague. The nature of erratic blocks is not less various than their size. Every species of rock seems to have contributed a portion of its substance towards the mass, though the harder, being better capable of resisting the disintegrating and corroding influence of atmospheric causes, are found in the greatest abundance, such as quartz, petrosilex, greenstone, granite, porphyry, syenite, gneiss, primitive and transition limestone, dolomite, serpentine, siliceous pudding-stones, siliceous sandstones, &c.

The distribution and situation of these blocks are also very different. Seldom isolated, they are generally found in patches or groups, as in the environs of Geneva, the plains of Westphalia, in Sweden, &c.; or in long bands or trains, as in the north of Mecklenberg Strelitz, where they run in a direction west-north-west and east-south-east; or widely spread over considerable tracts, as between Warsaw and Grodno, between St. Petersburg and Moscow, in East Prussia, &c. Sometimes they cover horizontal plains, as in the north of Germany; sometimes they rest on the sloping sides of mountains, as in the Alps and the Jura, and occasionally on the very tops of lofty eminences, as on the summits of the calcareous mountains of Rettwick, of Rædaberg, and of Osmund, about 6000 feet above the level of the sea. Sometimes they are seen in greatest abundance at the bottom of valleys where they open into the plains, and in other instances they are found collected in the largest quantity in the high and narrow parts of the valleys, as is observed at Detmold and east of Lemgo. At times they are so abundant as to be accumulated into hills of a particular form, as is the case in Smaland, in Sweden; and sometimes they form even mountains of considerable height, as may be seen near Quedlio, in Norway; and what is remarkable, the larger blocks are at the top, the others diminishing gradually towards the bottom.

Though generally superficially disposed, erratic blocks are however in some places found imbedded in a fine sand which has nothing in common with their nature or origin, as in the plains of Westphalia. Some blocks (and this may depend either on their own particular nature, or the greater or less friction to which they have been subjected, the length of time they have been exposed to atmospheric influence, or the nature of the climate,) have their angles and edges as sharp as though they were just detached from their native mountains, as is the case in the neighbourhood of Groningen.

When the erratic blocks are not at any great distance from the spots whence they come, they may be easily traced up to their origin. Thus those which are in the basin of the Rhine come from the Grisons; those of the valley of the lake of Zürich and of the Limmat have been detached from the mountains of Glaris; those of the basin of the Reuss come from the rocks at the source of this river; and those of the Aar and the Jura from the lofty mountains in the canton of Berne. Even those which cover the widely extended tract from Holland on the west, to St. Petersburg and Tver on the east, are supposed by Von Buch, Hausmann, Brugmans, Alex. Brongniart, &c., to be traceable to Scandinavia. It is however remarkable that, contrary to what is generally observed of transported debris, the blocks are frequently largest as they are farthest removed from the place whence they came, diminishing gradually in size as they approach the parent rock; thus the blocks found in Mecklenberg and Seeland, which are ascertained to be derived from the Scandinavian peninsula, are larger than the blocks of the same rocks in Scania and East Gothland, and they disappear altogether close to the primordial mountains whence they were derived.

In certain places the blocks are almost exclusively of a particular kind, while in others they vary greatly in their mineral character, proving, together with the ascertained situation of the same rocks in situ, that they must have been assembled from various quarters. This is the case with the erratic blocks of Yorkshire, and with those of Lithuania, for though the greater part, perhaps, of those in the latter locality may be similar to the rocks in Sweden and Norway, there are many evidently derived from other places.

As for the direction in which the bands of erratic blocks seem to lie, and the quarter whence they seem to have come, they are very various. We have just seen that in the north of Mecklenberg the trains are in a line west-north-west and east-south-east. Count Rasoumovski observes that, when many blocks are accumulated they form parallel lines with a direction from north-east to south-west. Brongniart says they have a general direction north and south. Sir James Hall speaks of those in the neighbourhood of Edinburgh as coming from the west. We have said that those on the north of the Alps come from the south.

If any thing further were necessary to complicate the problem of erratic blocks, it is the immense distance at which they are sometimes found from the nearest rocks of similar composition; thus blocks of granite are found on the mountains of Potosi, while the nearest granite rocks are in Tucuman, about four hundred leagues off. Nor is distance all; the detached blocks are found separated from their parent rocks by intervening hills, broad and deep valleys, as that of the Aar, and even by straits and seas: thus in the north of Cumberland there are boulders which have been transported across the Solway Frith from Dumfries, and the blocks on the low plains of Germany are separated from their parent rocks by the Baltic.

England, as well as the continent of Europe, has many spots covered with erratic rocks, some of which seem to be derived from Norway, while others are evidently the debris of our own mountains. For details we refer the reader to the observations and works of Sedgwick, Conybeare, Lyell, Buckland, Phillips, Hibbert, &c.

Erratic blocks are also common in America and other parts of the world.

From what has been already said, and from the circumstance of erratic blocks lying on some of the most modern formations, it will be easily conceived that they present one of the most inexplicable of geological phenomena. The blocks on the Jura, and from the Alps generally, having first attracted notice, have given rise to a great variety of hypotheses, the most remarkable of which are the following:—1. De Luc was of opinion that these blocks had been projected into the air by the same force which upheaved the Alps, and that they had fallen at greater or lesser distances, according to the strength and direction of that force. 2. Von Buch, Escher, &c., attribute their existence to an immense débacle which swept down the blocks from the Alps to the foot of the Jura, up the slope of which they were forced by the impulse they had received, in the same way as a ball rolled along with force rises up a hillock. 3. Others, as Daubuisson, have thought that these blocks, which are almost wholly of transition rocks, were the remains of a mantle of these rocks, of later formation than the limestone of the Jura, and consequently much more recent than is generally admitted, and which, having been destroyed, left nothing but these testimonials of their former existence. 4. Dolomieu supposed that the summits of the Alps were formerly connected with those of the Jura by an inclined plane, which has been destroyed by the same revolution that precipitated the blocks from the summit of the Alps to the plateau, and into the valleys of the Jura. 5. Venturi has attempted to explain the passage of the blocks from the Alps into the basin of the Po, by floating them down on rafts of ice. 6. Others have upheaved the Jura, which they suppose to have been formerly on a level with the base of the Alps, and with it the blocks which had rolled down upon this calcareous plain. 7. Finally, Von Buch, extending his general theory to the particular phenomenon, thinks that the dispersion of the blocks is the result of an upraising of the Alps posterior to the formation of the tertiary rocks.

M. Brongniart very justly observes that these hypotheses leave many difficulties unexplained: he conceives that as the phenomenon of erratic blocks is a very general one, it is presumable that the cause also is general. Certain it is that even if it were possible satisfactorily to assign a cause for the erratic blocks found upon the Jura, the same reasoning would hardly be applicable to other cases; and in the utter impossibility of discovering any single cause competent to the production of such different effects, we must have recourse to the more probable conjecture of M. Larivière, that the dispersion and disposition of erratic blocks have been effected in different ways. The more powerful cause however he conceives to be the transporting power of icemeers and icebergs, in which opinion he is followed by Mr. Lyell and others.

Erratic blocks, like other phenomena, are attended with their peculiar advantages: thus on hot and dry soils, and when not in too great abundance, they keep the soil cool and moist, sheltering it from the direct rays of the sun in the day, and thus diminishing the evaporation of its moisture. On cold soils they tend to maintain an equable warmth by diminishing radiation at night. In some countries they are the only building-stones, as in East Friesland and the neighbourhood of Groningen. In others they supply the necessary lime, as at Königsberg, Revel, &c. Those of a convenient size are used in Russia and Poland for paving the towns: when broken they are exceedingly well adapted for the repairs of roads.

ERRHINES (from *en* (ἐν), and *rhin* (ῥὶν), 'the nose'), medicines which are applied to the nostrils, and which cause an increased flow of the secretion of the membrane which lines them, and often of the contiguous cavities and sinuses; frequently also occasioning sneezing, and an unusual secretion of tears. Snuffs of different kinds are familiar examples of this class of substances, and these generally cause sneezing, at least when first employed; but others, such as the turpeth mineral, merely produce increased secretion of the membrane. Where sneezing ensues a considerable shock is felt over the whole frame, and of [illegible] effect advantage is sometimes taken to change the action of the system, or to remove morbid impressions, as when certain fits are impending, or for more limited purposes, such as dislodging any foreign body from the nose. The secondary effect of errhines is more frequently desired to give relief to the loaded vessels, by exciting them to an increased secretion. Hence they are used in various diseased conditions of the organ of smell, and even of the neighbouring organs, being supposed to influence the vessels of the eye, and even of the brain. Some affections of the eye, and also of the head, are certainly relieved by such means, and their occasional use may be permitted; but the habitual use of errhines is in most cases objectionable, and followed by hurtful consequences. The membrane of the nose becomes thickened, its sensibility impaired, and the power of discriminating odours greatly lessened; while, if the substance be possessed at the same time of narcotic qualities, such as snuff procured from tobacco, the palate, the stomach, and other organs concerned in digestion likewise suffer, and loss of appetite with other symptoms of indigestion result.

ERRINA. [Milleporidæ.]

ERROR (in law), a fault in the pleadings or in the process, or in the judgment, upon which a writ, called a writ of error (breve de errore corrigendo), is brought. It is the ordinary mode of appeal from a court of record, and is in the nature of a commission to the judges of a court superior to that in which the judgment was given, by which they are authorized to examine the record, and on such examination to affirm or reverse the judgment according to law. For the cases in which this writ is issued, and the courts to which it is directed, see Bac. *Abr.* tit. *Error.*

ERSKINE, THOMAS LORD, was the third and youngest son of David earl of Buchan. He was born, according to some authorities, in January, 1748, and received the rudiments of his education partly in the high-school of Edinburgh, and partly at the University of St. Andrews. In 1764 he entered the navy as a midshipman, but not thinking his prospects of promotion in that service sufficiently good, he accepted a commission in the first regiment of foot in 1768. In 1770 he married Frances, daughter of Daniel Moore, M.P. for Marlow, and soon after went with his regiment to Minorca. Upon his return to England, in 1772, he appears to have become remarkable for the brilliancy of his conversational talents. (Wraxall's *Memoirs*, vol. i. p. 152, and Boswell's *Life of Johnson*, vol. ii. p. 170, ed. 1799.) In 1775, at the pressing solicitation of his mother, but it is said against his own judgment, he commenced the study of the law, and entered himself a student of Lincoln's Inn, and also as a fellow commoner of Trinity College, Cambridge, but only for the purpose of obtaining a degree, and thereby saving the additional term of two years, during which his name must otherwise have remained on the books of Lincoln's Inn. He became the pupil of Mr. Buller, and afterwards of Mr. Wood, both of whom were subsequently raised to the Bench. In Trinity term, 1778, Mr. Erskine was called to the bar, where his success was as rapid as it was brilliant. In the same term he was employed as one of the counsel for Capt. Baillie, lieutenant-governor of Greenwich Hospital, who was prosecuted for an alleged libel on the other officers of that establishment. The prosecution was in fact instituted by Lord Sandwich, then at the head of the admiralty, who, it appeared, had abused the charity by appointing landsmen as pensioners to serve his own electioneering purposes. Mr. Erskine's eloquent and indignant speech at once established his reputation; such indeed was its instantaneous effect, that thirty retainers were presented to him before he left the court. His practice and reputation increased so rapidly, that in 1783, when he had been scarcely five years at the bar, he received a patent of precedence at the suggestion of Lord Mansfield, who then presided in the court of King's Bench. In the same year Mr. Erskine was returned member for Portsmouth, through the interest of Mr. Fox, with the immediate view of supporting that minister's famous India Bill. In the House of Commons however his success by no means equalled the expectations which his friends had formed, though his parliamentary speeches would appear to have been far above mediocrity. In the same year also he was made attorney-general to the prince of Wales, an appointment which, to the disgrace of the advisers of the crown, he was called upon to resign in 1792, in consequence of his refusing to abandon the defence of Thos. Paine when he was prosecuted for his publication 'The Rights of Man.' In 1802 he was made chancellor of the Duchy of Cornwall; and in 1806, on the formation of the Grenville ministry, he was appointed lord chancellor,

and raised to the peerage by the title of Baron Erskine, of Restormel Castle, in Cornwall. His tenure of office was however brief, for on the dissolution of the ministry in 1807, he retired from public life. After this period Lord Erskine seldom appeared in his place in the House of Lords, but in 1820 he took a prominent part on the occasion of the trial of Queen Caroline.

In the later years of his life he was harassed by pecuniary embarrassments, arising from the loss of his large professional income, and an unfortunate investment of the fruits of his industry in land. His first wife died in 1805, and an ill-assorted second marriage increased his domestic disquietudes, injured his reputation, and gave pain to his friends. He died Nov. 17, 1823.

Lord Erskine's talents were peculiarly those of an accomplished and dexterous advocate: his eloquence formed an æra at the bar, and his addresses to juries captivated their understandings, their imaginations, and their passions; they were not marked by beauty of diction, richness of ornament, or felicity of illustration, but by strength, vigour, and simplicity, and a perfect freedom from colloquial vulgarisms. A remarkable feature in his speeches is an exact and sedulous adherence to some one great principle which he laid down, and to which all his efforts were referrible and subsidiary. As the principle thus proposed was founded on truth and justice, whatever might be his ingenuity in applying it to the particular case, it naturally gave to his address an air of honesty and sincerity which had great influence with the jury.

His extraordinary talent was developed by the times in which he lived; his indignant eloquence was called forth in defence of those individuals in whose persons the court and the government attacked the liberty of the press and constitutional freedom. The public mind was in a state of ferment from the recent events of the French revolution; and the government, in their hatred of the great principles of liberty then being established, forgot that actions, not principles, are the proper subjects for prosecution. As counsel for the defendants in these political prosecutions, Lord Erskine made his noblest and most successful efforts; fearless and zealous in the cause of his client, he spoke home truths without using unnecessary violence or low invective.

Lord Erskine has left few productions in writing; the principal are the Preface to Fox's Speeches, the political romance called 'Armata,' and a pamphlet entitled 'View of the Causes and Consequences of the War with France,' which passed through 48 editions. His speeches have been published in 5 vols. 8vo. Lord Erskine is not to be considered as a literary man; but it is one of the many singularities in his history, that with a scanty stock of what is usually called literature, he should have been one of our purest classical speakers and writers. His study was confined to a few of the greatest models, and these he almost knew by heart. He greatly admired the writings of Burke, and frequently quoted them in his speeches.

Scanty notices of the life of Lord Erskine are published in Lardner's *Cyclopædia* ('Lives of British Lawyers') and the 3rd vol. of the *Gallery of Portraits*, from which this account has been taken. There are some remarks upon the style of his eloquence in Butler's *Reminiscences*, vol. i. p. 70. His statue is in Lincoln's Inn Hall.

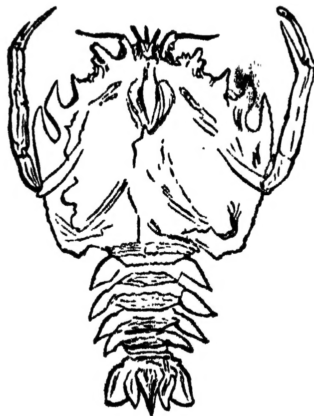
ERUCI'VORA. (Zoology.) [LANIADÆ.]

ERUPTION. [VOLCANO.]

ERWIN. [STRASBURG.]

ERYCI'NA. [VENERIDÆ.]

E'RYON, Desmarest's name for a macrourous crustacean, only known in a fossil state.



External *antennæ* short (one-eighth of the total length of the body including the tail), setaceous, provided at their base with a rather large scale, which is ovoid and strongly notched on the internal side; *intermediate antennæ* setaceous, bifid, much shorter than the external ones, and having their filaments equal. *Feet* of the first pair nearly as long as the body, slender, linear, not spinous, terminated by very long and narrow chelæ, with fingers little bent, but slightly inflected inwards; *carpus* short; feet of the other pairs also slender, and those of the second and third pair terminated with pincers, like the feet of the crawfishes (écrevisses). *Carapace* very much depressed, wide, nearly square, but little advanced anteriorly, profoundly notched on its latero-anterior borders. *Abdomen* rather short, formed of six articulations, of which the four intermediate ones have their lateral borders prolonged in angles, well detached, as in the crawfishes. Caudal-fin formed of five pieces, of which the two lateral are entire, rather large, a little rounded on the internal side, and the three middle ones triangular and elongated, especially the intermediate one.

Locality.—Lithographic limestone of Pappenheim and Aichtedt in the Margraviat of Anspach. (Desmarest.)

M. Desmarest observes that this genus is entirely anomalous, and ought, in a natural classification, to form a section by itself. According to the method of Dr. Leach, it would belong, 1st, to the order *Macroura;* 2nd, to the second section, which includes those *Macroura* which are provided with a caudal flabelliform fin; 3rd, to the subsection B, which have the peduncles of the internal antennæ moderately elongated; 4th to the 5th division, which have the natatory blades of the extremity of the tail formed of a single piece, the second articulation of the abdomen not dilated, and rounded anteriorly and posteriorly on each side; and finally, feet to the number of ten.

M. Desmarest goes on to say that it is to the *Callianassæ*, the *Thalassinæ*, the *Gebiæ*, and the *Axii*, that *Eryon* bears relation. Nevertheless it has not, he observes, the habit of any of them. Its short depressed carapace, and its little elongated abdomen approximate it to *Scyllarus*, but its internal antennæ with short peduncles, its external setaceous antennæ and its great anterior didactylous feet, widely separate it from that genus. It cannot be confounded with *Palinurus*, which has the external antennæ, and the peduncles of the internal ones so long, and whose feet are all monodactylous; and, finally, it cannot be referred to the crawfishes or lobsters (*Astacus*), whose shell is differently formed, and which have the external natatory blades of the tail composed of two pieces; but Desmarest thinks that it is to the last-named genus that *Eryon* most approximates, taking into consideration its general character. He regrets that he has not been able to satisfy himself whether the four antennæ are inserted on the same horizontal line or not, a fact which would have assisted him in his comparison with other genera.

Example.—*Eryon Cuvieri.* Carapace finely granulated above, marked by two deep and narrow notches on the two latero-anterior borders, and finely crenilated on the latero-posterior borders. Length, four to five inches French.

Eryon Cuvieri.

The fossil was noticed by Richter, Knorr, and others, before M. Desmarest, as, indeed, he states.

ERYSI'PELAS (*Ignis Sacer, the Rose, St. Anthony's Fire*), an inflammation of the skin, occasioning a spreading redness, which occupies a broad surface, on which are formed vesicles or blisters, preceded by and accompanied with fever. The whole of the inflamed surface is painful, but the pain is not acute; it is rather a sensation of burning or stinging than of severe pain. The redness is not intense like that produced by phlegmon or boil, but is of a pale rose colour. There is always considerable tumefaction; the tumor is not surrounded by a definite boundary, but is diffuse, irregularly circumscribed, and unattended with a sensation of throbbing. The tumor is often soft and boggy. It is characterised by the vesications which form upon it.

The proper seat of erysipelas is the skin, but the appearance of the disease is somewhat modified according to the

part of the skin which is more especially inflamed. If the rete mucosum, or the part of the skin which is placed immediately beneath the cuticle [SKIN] be the principal seat of the inflammation, the vesication is remarkable; there is commonly a considerable discharge from the vesicles, and a free exfoliation of the cuticle: if, on the contrary, the inflammation be chiefly seated in the cutis vera, or the true skin, namely, that portion of the skin which lies immediately beneath the rete mucosum, the cellular tissue beneath the skin is always more or less involved in the inflammation, and then the tumefaction is considerable on account of the infiltration of the cellular tissue with serum poured out from the blood by the inflamed cuticle.

Erysipelatous inflammation is characterized by its tendency to spread, and thereby to cover a considerable portion of the external surface of the body. It creeps on in succession from one part of the skin to another until it extends to a great distance from the part originally attacked, the inflammation often disappearing from the former as it becomes established in the latter. Sometimes the inflammation appears to pass from the external surface to the internal organs, and occasionally the disease quits the surface as it attacks the internal organs, although more commonly the external and internal inflammation go on simultaneously, greatly increasing the severity and danger of the attack.

Erysipelas most commonly attacks the face, but it sometimes seizes on one of the extremities: the disease is always more severe when it attacks the head than when it is seated in any other part of the body.

The inflammation which appears on the external surface of the body in erysipelas is not the primary and essential part of the disease, but a remote event depending on a preceding state of disease affecting the whole system. This is proved by the fact that constitutional disturbance always precedes, commonly for the space of two or three days, the appearance of the local affection.

An attack of erysipelas comes on either with chills or a distinct cold shivering, attended with a sense of lassitude, aching in the limbs, restlessness, and that disordered state of the skin which has been expressively termed febrile uneasiness. There is from the beginning uneasiness or confusion in the head, which soon amounts to decided pain. This is accompanied with such a degree of drowsiness, that the attack may sometimes be predicted long before there is any appearance of redness or swelling in the face, from the inability of the patient to keep himself awake. The chilliness is soon succeeded by heat of skin; the appetite fails, the bowels are constipated, the tongue is dry and parched, there is sometimes nausea and vomiting; the pulse is always frequent, sometimes full, soft, and compressible, but occasionally hard and tense.

After these symptoms have continued some time, always one, generally two, and sometimes three days, there appears on some part of the face a redness, attended with burning heat and tingling. Commonly a red spot appears on one cheek; after a short time a similar spot appears on the other cheek; often the redness spreads successively from one cheek to the other across the nose, which is completely involved in the affection: from the nose it extends to the forehead, and thence over the whole scalp. Soon after the redness appears the face begins to swell; and by the second night, or the morning of the third day from the commencement of the fever, the eyes are completely closed, the eyelids exceedingly prominent, the nose distended, and the ears tumid, red, shining, and burning. On the fourth or fifth day the vesications appear on the inflamed surface, which break on the fifth or sixth, when the redness changes to a yellowish hue. The whole face is now so turgid that the form and expression of the features are completely lost, and the patient could not possibly be recognized by his most intimate friend.

The surface of the skin in the blistered places becomes covered with a brownish or dark coloured scab, which often gives a livid or blackish appearance to the part; but this livid colour seldom goes deeper than the surface, and does not proceed from any degree of gangrene affecting the skin. On the parts of the face not affected with blisters the cuticle is destroyed, and desquamates, a new cuticle being formed beneath it. Though the face, in general, however intensely inflamed, seldom goes into suppuration, yet it is by no means uncommon for matter to form in the tumid eyelids.

Occasionally, though not often, when erysipelas attacks the face, it extends to the mouth and fauces, and even to the pharynx and larynx, at the same time that it covers the neck and chest externally. Dr. Copland mentions a case in which the enormous tumefaction of the neck and throat with the affection of the larynx and trachea, increased by the constriction produced by the integuments surrounding the neck and throat, caused suffocation in a few hours. When the inflammation extends to the fauces, throat, and larynx, it sometimes produces a species of croup.

On whatever part of the body the inflammation appears in erysipelas, even when it is strictly confined to the skin, its appearance is not attended with any remission of the fever which preceded it: on the contrary, the fever generally increases with the augmentation and extension of the inflammation.

The progress of the disease is more or less rapid, and its duration longer or shorter, according to the age, the temperament, and the vigour of the individual. In the young, the sanguine, and the robust, the tumefaction is sometimes fully formed on the second day, and the whole terminates on the sixth or seventh, while in the aged and the less vigorous it may be protracted to the tenth or twelfth, and the disquamation may not be completed before the fourteenth day. The average duration of the disease may be stated to be from eight to ten days.

When the fever and inflammation are intense, delirium comes on, which sometimes rapidly passes into coma. These are most alarming symptoms, indicating a severe and too often a mortal inflammation of the brain. In such cases death frequently takes place, with many of the symptoms of apoplexy on the seventh, ninth, or eleventh day of the disease. 'In such cases,' says Dr. Cullen, 'it has been commonly supposed that the disease is translated from the external to the internal parts. But I have not seen any instance in which it did not appear to me that the affection of the brain was merely a communication of the external affection, as this continued increasing at the same time with the internal.

'When the fatal event does not take place, the inflammation, after having affected a part, commonly the whole of the face, and perhaps the other external parts of the head, ceases. With the inflammation the fever also ceases; and, without any evident crisis, the patient returns to his ordinary state of health.'

In the cases which prove fatal, on the examination of the body after death, the inflamed skin is found infiltrated with serum, which is sometimes mixed with pus, and occasionally portions of the skin are found disorganized, and in a state of gangrene. It is remarkable that the blood in the large vessels and in the cavities of the heart is semifluid, and that the veins which proceed from the inflamed parts are in a state of inflammation, and contain pus, more especially when the inflammation has extended from the skin to the cellular tissue and has passed into suppuration. In the cases attended with delirium and coma the membranes of the brain, and especially the arachnoid, are thickened and opaque with the effusion of serum between the membranes and into the ventricles. If the disease has been complicated with inflammation of the fauces, pharynx, œsophagus, trachea, and bronchi, these organs present the ordinary signs of inflammation; and the same is true with regard to the mucous membrane of the stomach and intestines; but in all these cases the signs of inflammation are much more closely allied to those which occur in fever than to those which are proper to pure inflammation.

There is a peculiar condition of the skin which seems to predispose to erysipelas connected with the irritable or bilious temperament, and a plethoric habit of the body. The occurrence of the disease once renders the skin peculiarly susceptible to its recurrence. Unwholesome and indigestible food, the excessive use of spirituous liquors, the suppression of the excretions, and more especially the suppression of the perspiration, of the bile, and of the catamenial discharge, predispose to erysipelas.

The exciting causes are exposure to cold and moist air after the body has been previously heated; exposure to sudden and great alternations of temperature; exposure to great heat however produced, whether by the direct rays of the sun or by a fire; intemperance; unwholesome articles of diet, as shell-fish, or stale and rancid fish; rich, oily, fat, or smoked meats; impure states of the atmosphere; an impure state of the body, arising from a morbid condition of

the blood, in consequence of the suppression of its depurating processes, whence the frequent occurrence of the disease in the advanced stages of fever, greatly complicating the state of fever and exhausting the little remaining strength of the patient. Violent emotion of mind has also been observed to be an exciting cause of erysipelas in those powerfully predisposed to the disease; in whom also local irritants often induce it, as wounds or punctures in the skin, the bites of leeches, the stings of insects, inoculation with variolous or vaccine matter. Instances are on record in which both variolous and vaccine matter have produced in children of irritable habits, two or three days after inoculation, an erysipelatous inflammation which has proved fatal.

It is a point much disputed whether erysipelas be capable of being propagated by contagion. 'The disease,' says Dr. Bateman, 'has been noticed in several hospitals to prevail in certain wards, among patients admitted with different complaints; but has seldom been known to spread in private houses. Dr. Wells, indeed, has collected several examples of the apparent communication of erysipelas by contagion, which occurred in private families. But such are at all events extremely rare, and perhaps never happened in well ventilated and cleanly houses. From the Royal Infirmary, at Edinburgh, this disease, like the puerperal fever, was banished by ventilation, white-washing, and other means of purification; and it has not occurred in any hospital of late years, since a better system has been adopted in these respects. Other diseases, not infectious in themselves, appear to become united with typhus, or contagious fever, under similar circumstances, and thus to be propagated in their double form; the dysentery, for example, the peritonitis of women in child-bed, ulcerated sore throat, &c. The simple phlegmonous erysipelas, at all events, was never seen to spread like an infectious disease.'

The danger of erysipelas is in proportion to the intensity of the inflammation, and the severity of the affection of the brain. The danger is also imminent when there is great tumefaction of the throat, or when the inflammation spreads to the respiratory passages and the respiratory organs. As long as the inflammation is confined to the external surface, and the fever remains moderate, the brain not much affected, and the heart's action not inordinate, a favourable termination of the malady may be expected. The different varieties or species of the disease are also attended with very different degrees of danger. Authors usually describe four species, namely, the phlegmonous, the œdematous, the gangrenous, and the erratic. The phlegmonous is that form of the disease in which the inflammatory state of the system is the most distinctly marked. In the œdematous the fever and inflammation are less intense; but the tumefaction is so great that the appearance of the face resembles that of a bladder distended with water. This form of the malady most commonly affects persons of debilitated constitutions, who have been previously attacked or are simultaneously affected with dropsy, or some other chronic disease, incident to a cachectic state of the system, and induced commonly by habitual intemperance. It is always attended with considerable danger, for the disorder of some internal function increases with the advancement of the external disease. Very frequently delirium and coma come on at the height of the disease, and terminate fatally on the seventh or eighth day; or, in other cases, the symptoms continue undiminished, and death occurs at a later period. When this form of the disease attacks one of the extremities, it is attended with but little danger.

In the gangrenous form of the disease the colour of the affected part is of a dark red, and scattered vesicles with a livid base appear upon the surface, which frequently terminate in gangrenous ulcerations. Suppuration and gangrene of the muscles, tendons, and cellular tissue often take place, producing little caverns and sinuses, which contain an ill-conditioned pus, together with sloughs of the mortified parts, which are ultimately evacuated from the ulcers. It is accompanied with symptoms of low fever, in the progress of which delirium comes on, soon followed by coma. It is always a tedious and precarious and often a fatal form of the disease.

In the erratic species the inflamed patches appear one after another in different parts of the body, thus travelling in succession from the face to the neck and trunk, and from the trunk to the extremities. It often happens that each accession of the complaint is less and less severe as it recedes to a greater distance from the part first affected, and this form of the disease commonly terminates favourably in a week or ten days.

In the phlegmonous species, characterized by the presence of inflammatory fever, the method of treatment must be widely different from that proper to the œdematous and gangrenous, in which there is the very opposite state of the system. In the young, the plethoric, the sanguine, and the robust, at the commencement of the attack, when there is much pain in the head, when the heat of the skin is intense, and the pulse is full and strong, the remedies proper in any other case of inflammatory fever are required; namely, bleeding to the extent of the subdual of the inflammatory condition of the system. In such a case there is danger that the disease will terminate in fatal inflammation of the brain, unless there be a free abstraction of blood. But it must be borne in mind that erysipelas does not ordinarily occur in the youthful and vigorous constitution; that it is not often accompanied with the signs of acute inflammation; that blood-letting is required only when acute inflammation is present, and that the extent of the bleeding must be strictly regulated by the degree of the inflammatory action. In an ordinary attack of phlegmonoid erysipelas, general bleeding is not necessary, at least in the constitutions commonly found in a crowded city. Moderate purging, diaphoretic and saline medicines, strict confinement to bed in a cool apartment, with the diet appropriate to febrile diseases, are all the remedies required. If local bleeding and blistering appear to be indicated, care must be taken not to apply the leeches or the blister near the inflamed surface. Various applications to the inflamed surface have been recommended, the most common of which is flour, or some other absorbent powder, to imbibe the fluid which oozes from the vesications. The utility of such applications is doubtful. 'The application of powdery substances,' says Dr. Bateman, 'has commonly, according to my own observation, augmented the heat and irritation in the commencement; and afterwards, when the fluid of the vesications oozes out, such substances produce additional irritation, by forming, with the concreting fluid, hard crusts upon the tender surface. In order to allay the irritation produced by the acrid discharge from the broken vesications, Dr. Willan recommends us to foment or wash the parts affected, from time to time, with milk, bran, and water, thin gruel, or a decoction of elder-flowers and poppy-heads. In the early state of the inflammation, when the local heat and redness are great, moderate tepid washing, or the application of a cool but slightly stimulant lotion, such as the diluted liquor ammoniæ acetatis, has appeared to me to afford considerable relief.'

In the œdematous species, when it occurs in broken-down constitutions, the result of habitual intemperance, even purgatives must be very cautiously administered; the strength must be sustained by mild nutritive diet, and tonics, as cinchona or quinine, and even stimulants, as camphor, wine, or the beverage to which the patient has been habituated, are required. The aperients employed should be mild alterative mercurials, with equal parts of castor-oil and the spirit of turpentine administered perhaps every alternate morning.

In the gangrenous species, quinine in considerable doses through the whole course of the disease, opium, camphor, the mineral acids, wine, brandy, and the general regimen adapted to gangrenous affections occurring under other circumstances, must be freely employed. The remedies indispensable in the phlegmonoid species would be fatal in this form of the disease, while the remedies which afford the only chance of saving life in the latter would produce fatal inflammation of the brain if administered in the former.

ERYTHACA (Zoology). [BLUE BIRD, vol. v. p. 17; SYLVIADÆ.]

ERYTHE'MA, a superficial redness of some portion of the skin, varying in extent and form, attended with disorder of the constitution, without vesications, and uninfectious. It is distinguished from erysipelas by the slight degree of constitutional disorder, by the slight degree of local pain, by the more uniformly favourable termination of the disease, and by the absence of tumefaction and vesication.

Authors describe several species of this affection, namely,

1. The fugacious (*Erythema fugax*), consisting of red patches of an irregular form, resembling the redness produced by pressure. These patches appear successively on the arms, neck, breast, and face. This affection is gene-

rally indicative of, and produced by, some disorder of the digestive organs.

2. The shining (*Erythema læve*), exhibits a uniformly smooth shining surface, and chiefly appears on the lower extremities in confluent patches. It is sometimes symptomatic of disorder of the digestive organs; occasionally attends the catamenia in delicate and irritable females, but most commonly accompanies anasarca or œdematous swellings. Under whatever circumstances anasarca occurs, so as greatly to stretch the skin, this Erythema is liable to be produced, and is often checkered with patches and streaks of a dark red and purple hue. It commonly terminates in extensive disquamation of the skin, and may be considered as merely a modification of œdematous erysipelas.

3. Marginated (*Erythema marginatum*) occurs in patches which are bounded on one side by a hard elevated tortuous red border, in some places obscurely papulated; but the redness has no regular boundary on the open side. The patches appear on the extremities and loins in old people, and remain for an uncertain time, without producing any irritation in the skin. They are connected with some internal disorder, and may be considered as indicative of serious and dangerous diseases.

4. Papulated (*Erythema papulatum*) appears chiefly on the arms, neck, and breast, in irregular extensive patches, and most frequently in females and young persons. The patches are of a bright red hue, often slightly elevated; and for a day or two before the colour becomes vivid they are rough or imperfectly papulated. The redness afterwards continues for several days; and, as it declines, assumes, in the central parts, a bluish or pale purple tinge. This variety is generally attended by a tingling sensation, passing to soreness as the colour changes; and sometimes with much constitutional disturbance,— with a frequent small pulse, loss of appetite, depression of strength and spirits, watchfulness, and pains or tenderness of the limbs, but the general disorder is trifling.

5. Tuberculated (*Erythema tuberculatum*) is merely a slight modification of the advanced stage of the papulated.

6. Nodose (*Erythema nodosum*) consists of large oval patches on the fore part of the legs; the long diameter of the patch is parallel with the tibia; these patches slowly rise into hard and painful protuberances, and as regularly soften and subside in the course of nine or ten days. The red colour turns bluish on the eighth or ninth day, as if the leg had been bruised. It chiefly affects children, and particularly females, and is very seldom observed in boys. It is preceded by slight febrile symptoms for a week or more, which generally abate when the erythema appears. It is sometimes connected with the approach of the catamenia, and its premature disappearance is not unfrequently succeeded by dangerous internal disease, as inflammation of the lungs.

The primary causes of erythema are the friction of contiguous parts, especially in fat persons; the accumulation of morbid secretions and excretions on the skin, as the matter of the perspiration, of the leucorrhœal discharge, of the catamenia, and of the alvine and urinary evacuations, in the adult in the course of other diseases, and in the infant in consequence of a want of proper ablution. It is also constantly produced by irritating articles of food and drink, and is the sign and the result of a disordered state of the digestive organs.

In most cases the affection disappears soon after the removal of the cause which produces it—by free ablution where it is the result of irritating matters on the skin, and its disappearance is assisted sometimes by the application of an absorbent powder to the inflamed surface, and at other times by the use of a gently stimulating lotion, as the spirit wash. When the disease is dependent on a disorder of the digestive organs, it can be removed only by the remedies proper for the removal of the stomachic, the hepatic, or the intestinal derangement. For the restoration of these organs to their sound condition, the most appropriate remedies are light diet, diaphoretics, the mercurial alteratives in combination with gentle aperients, and the mineral acids as tonics. (Bateman's *Practical Synopsis of Cutaneous Diseases*; Copland's *Dictionary of Practical Medicine*.)

ERYTHRÆA, a pretty genus of annual plants, belonging to the natural order Gentianaceæ, and inhabiting dry sandy places in Great Britain and other parts of Europe, especially near the sea. The species have small oval sessile ribbed radical leaves, diminishing in breadth as they ascend the stem; a corymbose stem, a five-cleft calyx, pink funnel-shaped flowers, with a short five-lobed limb, five stamens, spiral anthers, two roundish stigmas, and a linear capsule. They are all extremely bitter, and are collected by country people, under the name of centaury, as a substitute for gentian, in domestic medicine. English botanists reckon four supposed species.

ERYTHRÆA CENTAURIUM, Lesser Centaury, an indigenous plant, common by way-sides and edges of fields, flowering in August, at which time it is to be collected. The whole plant is taken up; it has a square stem, with opposite entire three-nerved leaves. It is devoid of odour; the taste is strongly bitter, but not unpleasant: 100 parts of the fresh herb dry into 47; 10 pounds of the dry herb yield by a single coction 3 pounds of extract.

It contains a principle called Centaurin, which at present is known only as a dark brown extract-like mass; but which, united with hydrochloric acid, furnishes an excellent febrifuge medicine. As a bitter, it suits irritable systems better than any article of that class of medicines, and is therefore to be preferred. In other respects it has the general properties of bitter tonics.

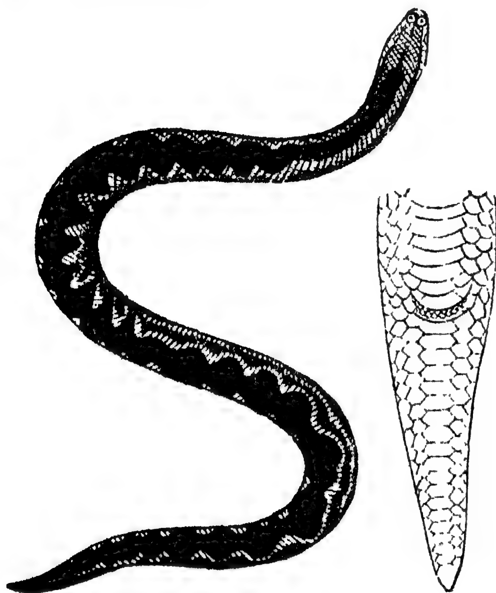
ERYTHRIC ACID, a substance obtained by Bragnatelli from the mutual action of nitric and uric acids; by spontaneous evaporation rhombic crystals are obtained, which have first a sharp and afterwards a sweetish taste, redden litmus, become of a rose colour, and effloresce in the air. Instead of being a peculiar acid, Dr. Prout regards it as a compound of nitric and purpuric acid and ammonia.

ERYTHRI'NA, a leguminous genus of tropical trees and tuberous herbs, with ternate leaves, and clusters of very large long flowers, which are usually of the brightest red; whence the species have gained the name of coral-trees. Frequently their stem is defended by stiff prickles. They occur in the warmer parts of the Old and New World. An Indian species, E. monosperma, is said to yield gum-lac. De Candolle mentions thirty-two species; of which E. crista galli is commonly cultivated in greenhouses for the sake of its splendid blossoms.

ERYTHROGEN, a neutral crystalline fatty matter found by M. Bizio in bile altered by disease.

ERYTHRO'NIUM (Dens Canis), a pretty little bulbous plant, whose name, Englished dog's-tooth violet, is derived from the form of its long slender white bulbs, is a native of woody subalpine places among bushes and stones, in Croatia, Idria, and about Laybach; it also occurs in Switzerland, but more seldom, and is also met with in the north of Italy. It is not mentioned in the Floras of the south of Europe. Two or three varieties are known in gardens as gay hardy flowers appearing early in the spring; one with purple, a second with white flowers, and a third, elevated by some into a species, with a somewhat stronger habit of growth.

ERYTHROXY'LEÆ, a group of exogenous plants, con-



Erythroxylon laurifolium.

1. A calyx with the monadelphous stamens; 2, a petal with its appendage; 3, the ovary, with the three styles; 4, a half-ripe fruit; 5, a transverse section of the same, showing that one only of the seeds comes to perfection, the two others being abortive.

sidered by some as a distinct natural order; by others as a subordinate division of Malpighiaceæ. They have alternate stipulate leaves, and small pallid flowers. The calyx is five-lobed; the petals are five, with a remarkable appendage at their base, which afford one of the marks of distinction between Erythroxyleæ and Malpighiaceæ; the stamens are ten, slightly monadelphous. The ovary is superior, three-celled, with three styles, and solitary pendulous ovules. The fruit is drupaceous. Some of the species of Erythroxylon, the only genus, have a bright red wood, occasionally used for dyeing; but the most extraordinary species is the Erythroxylon coca, of whose inebriating effects a full account has already been given. [COCA.]

ERYX or ERIX, a genus of serpents separated by Daudin from *Boa*, and differing from it in having a very short obtuse tail, and the ventral plates narrower. The head of *Eryx* is short, and the characters generally would approximate the form to *Tortrix*, did not the conformation of the jaws place it at a distance from the last-named genus. The head, besides, is covered with small scales only. *Eryx* has no hooks at the vent.

Eryx Bengalensis.

ERZERU'M, ERZ-RU'M, or ARZRU'M, a town in Turkish Armenia, in 39° 57′ N. lat., and about 41° 15′ E. long., towards the eastern extremity of an extensive and fertile plain between 30 and 40 miles in length and from 15 to 20 miles in its greatest breadth. This plain is watered by the Karà Sù, or western branch of the Euphrates, which rises at its eastern extremity, and from whose banks the town is three or four miles distant. The town is very large, and is partly surrounded by an old castellated wall, with a ditch, and on its southern skirts stands a citadel encircled by a double wall flanked with towers very close to each other, and with a ditch: it has four gates, and incloses the palace of the pacha and nearly the whole of the Turkish population. But a large portion of Erzerum is unwalled, and contains the principal bazaars and khans. The houses for the most part are low, and built of wood, but the bazaars are extensive, and well supplied with provisions. Erzerum has nearly forty mosques, a Greek church, and a large Armenian chapel. In the beginning of this century the population was estimated at 100,000 individuals; and in 1827 at 130,000. But being soon afterwards occupied by the Russians, the greatest part of the inhabitants abandoned the town, the Armenians emigrating to Russia, and the Turks retiring to the adjacent parts of Asia Minor. Since its restoration to the Turks by the peace of Adrianople the place is slowly rising from its state of decay, but in 1835 its population did not exceed 15,000. We do not know if any of its numerous manufactures have been revived. Before the Russian invasion considerable quantities of silk and cotton cloth were made here, and much leather tanned; there were also some manufactures of copper vessels.

Erzerum is important as a commercial town. Besides the produce of its manufactures it exports the excellent grain which is grown in the plain. But it derives other commercial advantages from its being situated on one of the most frequented caravan roads of Western Asia, which leads from Persia and Georgia to the great commercial towns of Asia Minor. This renders Erzerum an important place also in a political and military point of view. It is the seat of a pasha, and the pashalik yields only in rank and extent to that of Bagdad. (Kinneir; Brant, in *London Geogr. Journal*, vi.)

ERZGEBIRGISCHE-KREIS (circle of the Ore Mountains), a large province of the kingdom of Saxony, which takes its name from the mountains which bound it on the south and separate it from the kingdom of Bohemia. On the north it is bounded by the circle of Leipzig and by the duchy of Saxe-Altenburg; on the west by the grand duchy of Saxe-Weimar, the principality of Reuss, and the circle of Voigtland; and on the east by the circle of Meissen. It is the largest and most populous province in the kingdom, and contains an area of about 1747 square miles, on which there are 58 towns, 13 market villages, and above 700 villages and hamlets. In 1829 the population was 488,863, and it is at present estimated at about 506,000. The surface rises gradually from the borders of the Leipzig and Meissen circles, until it reaches the southern frontier and the lofty summits of the Ore Mountains. The province is intersected in all directions by offsets from those mountains, and presents a constant succession of hills and valleys. The loftiest heights in it are the Fichtelberg, at the southernmost extremity of the province, which is 3968 feet, and the Auersberg, about eleven miles north-west of the Fichtelberg, which is 3132 feet above the level of the sea. The Freiberg or Eastern Mulde, the largest river in the province, flows through its eastern districts, and the Schneeberg or Western Mulde through the western districts; the centre is irrigated by the Zschoppau, Flöhe, Pöhl, Sehm, Bockau, Chemnitz, and other streams; the Weiseritz or Westritz partially traverses the most easterly part, and the Pleisse the most westerly. There are no inland waters deserving the name of lakes, but there are a number of mineral springs, chiefly used for bathing, at Wolkenstein, Wiesa, near Annaberg, &c. The province is full of woods and forests, particularly its most elevated parts, such as the vicinity of Schwarzenberg. The average height of the Erzgebirgische Kreis above the level of the sea is estimated at 1200 feet.

In consequence of the rugged character of the surface, the hard, stony soil, and the rawness of the climate, neither agriculture nor horticulture are pursued on a scale of sufficient extent to supply the wants of the province. Oats, rye, linseed, potatoes, and a small quantity of wheat, are cultivated; these articles are also imported from Bohemia and the adjoining circle of Leipzig. There are fine and extensive pastures, particularly in the vicinity of Zwickau, Chemnitz, Augustusberg, Freiberg, and Nossen, where large flocks of sheep are kept; but cattle-breeding, on the whole, is not so actively carried on as it might be. The province is well known for its large trout, its salmon, carp, and other fresh water fish.

The very name of this part of Saxony, 'the circle of the Ore Mountains,' indicates the peculiar character of its natural riches. It abounds in mines of silver, tin, lead, iron, cobalt, &c., the first working of which is said to have taken place in the middle of the twelfth century. Their most flourishing state was in the fifteenth, when the silver mines of Schneeberg and Annaberg and the tin mines of Altenberg were discovered and opened. At the present day they afford employment, either directly or indirectly, to upwards of 200,000 persons. The largest silver mines are in the neighbourhood of Freiberg, of which the Erbisdorf alone produced 3,048,500 ounces of silver between 1769 and 1818: their number is about 200, with 540 pits (zechen); they occupy 4800 hands, and their present produce is from 375,000 to 450,000 ounces annually. The other silver mines are at Schneeberg, Schwarzenberg, Annaberg, Marienberg, &c. The most considerable tin mines are at Altenberg and Geier; others at Schneeberg, &c. No mines in Saxony produce so much iron as those of Johann-Georgenstadt: this metal is also obtained at Schneeberg, Altenberg, &c. Near Aue and Bockau, to the south of Schneeberg, in what is called the 'Saxon Siberia,' lie the largest

cobalt mines, and smalts, or blue-colour works in Germany; of these smalts the yearly produce is between 9000 and 10,000 cwts., besides large quantities of arsenic, &c. The white porcelain-earth used in the royal china manufactory at Meissen is procured and prepared in this district. Much sulphur and vitriol are made at and near Beierfeld and Geier: magnesia and porcelain earth are obtained at Elterlein; and there are coal mines of importance at Planitz, and other spots near Zwickau. The value of all the silver sold in 1833 was 862,764 dollars (122,200*l.*); and in 1834 about 1,000,000 dollars (141,600*l.*). The cobalt and blue colour (smalts) produced 321,724 dollars, or about 45,500*l.* The lead mines yield annually about 500 tons; the tin about 3000 cwt.; the copper about 18 tons; and the iron between 4000 and 4500 tons.

Besides considerable manufactures of iron, tin, and copper ware, the largest of which are at Freiberg, Schwarzenberg, Wiesenthal, and Elterlein, there are extensive manufactures of thread, twist, linens, cotton goods, woollen cloths, flannel, woollen stockings, &c., at Chemnitz, Zwickau, Zschoppau, Oederan, &c. Laces and bobbinet are made at Altenberg, as well as Annaberg, where nearly a thousand hands are engaged in making tapes and ribands. Much serpentine stone is worked from the quarries of Zöblitz, and steel is made at Schedewitz near Zwickau. In the upland districts various articles in wood are manufactured.

This province also includes the independent earldom of Solm-Wildenfels, with an area of 31 square miles, the 6200 inhabitants of which are principally employed in making linen, coarse cottons, and stockings; and the possessions of the princes and counts of Schönburg, in the north-western part of the province, comprising an area of 252 square miles and a population of about 84,000, who are engaged in agriculture as well as manufactures. The chief town is Glauchau, on the Western Mulde, with 5000 inhabitants, and manufactures of woollens.

The province is divided into the 'Amtshauptmannschaftliche Bezirke' or bailiwics of Chemnitz, Zwickau, Walkenstein, and Freiberg. Chemnitz, in the north-west, contains the towns of CHEMNITZ (see vol. vii. p. 38), Frankenberg on the Zschoppau, 5200 inhabitants; Oederan, 3800; Zschoppau, on the river of that name, 3300; and in the Schönburg possessions, Lössnitz, 3450; Glauchau; Hohnstein, 3600; Waldenburg, on the western Mulde, 3000; Penig, on the same river, 3100; and St. Merane, 2700. The bailiwic of Zwickau, in the west and south-west, contains Zwickau, on the western Mulde, with 5100 inhabitants and large woollen manufactories; Werdau, on the Pleisse, 3600; Wildenfels; Schwarzenberg, on the Schwarzwasser, 1400; Wiesenthal, 1600; Johann-Georgenstadt, on the Schwarzwasser, 2700; and Schneeberg on the Schleenerbach, 5800. The bailiwic of Walkenstein, in the south, contains the towns of ANNABERG (vol. ii. p. 40); Wolkenstein on the Zschoppau, 1600 inhabitants; Geyer on the Pleisse, 1800; Zöblitz, 1100; Elterlein, 1200; and Stollberg, 3050; and the bailiwic of Freiberg, in the east, contains Freiberg, on the eastern Mulde, the chief town of the Erzgebirge circle, 11500 [FREIBERG]; Haynichen, on the Striegis, 3000; Nossen, on the eastern Mulde, 1200; Rosswein, on the same river, 3500, with woollen manufactures; Fraunstein, 800; and Altenberg, 1600.

ERZGEBIRGE (the Ore Mountains) is a mountain-range in Germany, extending along the boundary line of the kingdoms of Bohemia and Saxony. It begins about 25 miles south-east of Dresden, on the very banks of the river Elbe, and extends in a west-south-west direction to the sources of the river called the White Elster (Weisse Elster), about 12° 30′ E. long., where it is connected with the Fichtel Gebirge. The river Elbe divides its eastern extremity from the Winterberg, the most western of the mountains of Lausitz, or Lusatia. The Ore Mountains extend in length about a hundred miles, and their mean width is estimated to be more than thirty miles.

The highest part of the range, which is towards its southern border, forms partly the boundary-line between Bohemia and Saxony, but is mostly within the former kingdom. Its southern declivity, which is steep and intersected with narrow valleys, terminates in the valley of the river Eger, about 10 or 15 miles from the upper range. The valley of the Eger lowers gradually from west to east, from 1100 feet to 400 feet above the sea. The northern declivity of the range descends in more gentle slopes towards the great plain of Northern Germany; and these slopes are divided from one another by wide and open valleys. A line drawn from Pirna on the Elbe to Tharand, Freiberg, Chemnitz, Zwickau, and Reichenbach, indicates with tolerable correctness where the range on this side ceases. The undulating plain which lies contiguous to it may be from 500 to 600 feet above the level of the sea.

The highest portion of the range occurs on both sides of 13° E. long., but rather to the west of it. Here are the Keilberg, 4212 feet, the Fichtelberg, 3968 feet, the Schwarzberg, 3988 feet, and the Hassberg, 3248 feet above the sea. Farther east and farther west the range gradually sinks lower, the Great Chirnstein, on the banks of the Elbe, rising only to 1824 feet above the sea.

This range belongs to the primitive formation, granite and gneiss being everywhere prevalent, except along the banks of the Elbe, where sandstone almost exclusively occurs. It is rich in metals of almost every kind, from which circumstance indeed its name is derived, though it is less productive than it was some centuries ago. The working of the mines is pursued with great activity and skill, and it is stated that more than 10,000 families are dependent on them for their livelihood. Gold occurs in a few places, but is not so abundant as to pay for the labour of getting it. The silver-mines are considerable, and their annual produce amounts to 60,000 marcs, at 12 ounces to the marc; that of the iron-mines amounts to 3500 or 4000 tons. The tin-mines of Saxony are the most valuable on the European continent, and produce annually 140 tons. Copper is not abundant, and the annual produce does not exceed 30 tons; but from the lead-mines 400 or 500 tons are annually obtained; and of cobalt 600 tons and upwards. Arsenic, brimstone, and vitriol, are likewise abundant; and there is also quicksilver, antimony, calamine, bismuth, and manganese. Coal abounds in the neighbourhood of Dresden and Zwickau. One of the most remarkable mineral productions is the kaolin, or porcelain clay, which occurs in layers six feet thick at Aue, about 12 miles south-east of Zwickau, whence it is carried to Meissen, and there used in the manufacture of the fine china-ware. Several kinds of precious stones are found, as garnets, topazes, tourmalins, amethysts, beryls, jaspers, and chalcedonies.

The upper parts of the range are covered with extensive forests, which furnish fuel for the great smelting works. The lower slopes and valleys are well cultivated, but the produce is not sufficient for the maintenance of the great population which is employed in the mines and in the numerous manufactures of cotton, silk, and linen. Great quantities of corn are annually brought from the plain which lies to the north of the range.

Six great roads pass over this range. By the two most eastern Dresden communicates with Prague. The more eastern of these two runs from the last-mentioned place to Lowositz and Aussiz, passes near Perterswalde through the pass of Zehist, and hence descends to Giesshübel and Pirna. The more western goes from Lowositz to Töplitz, passes the range near Zinnwald, and descends through Altenberg and Dippoldiswalde to Dresden. The third road leads from Prague to Laun on the Eger, hence to Kommotau, passes the range by the pass of Basberg, and descends to Chemnitz. The fourth road runs along the Eger from Saatz to Kaaden, traverses the range by the pass of Pressnitz, and thence leads to Annaberg and Chemnitz. The fifth road leaves the valley of the Eger near Kaaden, passes the range near Gottesgab, and leads through Schneeberg to Zwickau. The sixth and most western road runs from Carlsbad to Joachimsthal, and thence over the range through Johann-Georgenstadt and Schneeberg to Zwickau.

ESCALLONIA′CEÆ, a small natural order of exogenous plants, related to the genus Ribes, in the opinion of some, but to that of Saxifraga, according to other botanists. It consists of shrubs with evergreen leaves, which often emit a powerful odour like that of melilot; their flowers are red or white, and often are quasimonopetalous, in consequence of the approximation of their petals. They have an inferior many-seeded ovary, with two large placentæ in the axis, a definite number of epigynous stamens, a single style, and minute chaffy seeds with a very small embryo lying in oily albumen. All the species inhabit South America, on the mountains, especially in alpine regions. Escallonia rubra, montevidensis, illinita, and others, have now become common in warm sheltered gardens in this country.

Esculleria Serrata.

1. A flower magnified, without the petals; 2, a transverse section of the ovary.

ESCAPEMENT. [HOROLOGY.]

ESCARP, or SCARP, in fortification, is that side of the ditch surrounding or in front of a work, and forming the exterior of the rampart. In field-works the escarp is usually formed by cutting the earth at such an inclination as will permit it to support itself, which may be at 45 degrees with the horizon or more, according to the tenacity of the soil; and, to impede the enemy in attempting an assault, fraises or inclined palisades are frequently planted on the slope. In large fortresses the escarp is the exterior surface of the revetment wall which supports the rampart, and it is frequently formed at such an inclination that its base, measured in front of a vertical plane passing through the top of the wall and in the direction of its length, is one-sixth of the height of the wall; but engineers at present recommend both the escarps and counterscarps to be vertical, from an opinion that the action of the weather upon the brick-work will thereby be diminished. [REVETMENT.]

ESCARPMENT, a precipitous side of any hill or rock. In military operations ground is frequently scarped, as it is called, or cut away nearly vertically about a position, in order to prevent an enemy from arriving at the latter. Part of the rock of Gibraltar has been rendered inaccessible in this manner; and, in the execution of the intrenchments about Lisbon, in 1810, the British troops formed an escarpment from 15 to 20 feet high, and about two miles long, on the brow of a ridge of heights extending from Alhandra to the valley of Calandrix, in order to secure the line against an attack at that part. A similar work was executed along a ridge of hills between Mafra and the mouth of the S. Lorenzo.

ESCHARA. [POLYPARIA MEMBRANACEA.]

ESCHAROTICS (ἐσχαρωτικά, from ἐσχαρόω, to form a crust, or scab), are agents applied to the surface of the body, which destroy the vitality of the part which they touch and produce an eschar. This effect they occasion either by combining chemically with the animal matter, or by destroying the old affinities, and causing the elements of the part to enter into new combinations. Their action is more energetic in proportion to the degree of vitality of the part to which they are applied. They are classed under two heads, the *potential* cauterants, and the *actual* cautery: the former are chiefly chemical agents, and form new compounds with the elements of the part with which they come in contact; but some merely cause irritation and augmented absorption, and are distinguished as *erodents*. The actual cauterants are substances of an elevated temperature, which decompose the part which they touch, and completely destroy its organization.

The chief potential cauterants are strong mineral acids, such as the sulphuric or nitric, pure alkalies, and some metallic salts, especially nitrate of silver or lunar caustic. These are used either to produce counter-irritation, or to remove fungous or morbid growths. Lunar caustic seems to possess peculiar properties, and is unquestionably the most powerful *direct* antiphlogistic agent known. If applied in the solid state to many inflamed parts it speedily checks the morbid action, and is decidedly the best application to chilblains, and in leucorrhœa. The actual cauterants are used either for their primary action, viz., the immediate destruction of the part, or for their secondary effects. The former object is rarely attempted, except to prevent the absorption of any poisonous or contagious matter, such as the venom of a snake, or bite of a mad dog. The secondary effects are more important, and more varied according to the degree of heat of the substance applied. The first effect is pain more or less severe, a flow of blood towards the part, and more rapid performance of the process of interstitial deposition and absorption, terminating in inflammation, extending to a greater or less depth, according to the intensity of the heat, or form of the body employed. This increased action has often a salutary effect, which is frequently felt through the whole frame. Torpor and paralysis of the nervous system often disappear, and neuralgia both of the neighbouring and even distant parts is removed. Atony and laxity of the muscular system vanish, and every part displays more energy and power.

The actual cautery may be applied in a variety of ways, viz., hot water, hot vapour, moxa, and heated iron. The first of these is a very ready means of causing vesications in some diseases. In phthisis pulmonalis, or consumption, where pain is often more relieved by vesication than any other means, placing a sponge in a wine-glass, and pouring boiling water on it, then suddenly inverting the glass over the part of the chest where the pain is felt, will cause immediate vesication, followed by speedy relief. The vapour of boiling water, as it issues from the spout of a kettle, is also a convenient method of applying heat in inflammations of the joints, as in gout, morbus coxarius, and other deep-seated diseases of the bones. As the red-hot iron is now seldom used, being confined to veterinary medicine, moxa affords the best substitute, and it is very convenient, as any degree of intensity or rapidity of action can be given to it. [MOXA.]

The eschar which follows the application of the potential or actual cautery generally separates in a few days. The ulcer is then to be treated with different agents, according as it is wished to heal it or keep it open, as a farther means of counter-irritation.

ESCHEAT, from the Norman French word *eschet* or *echet*, chance or accident (a word derived from *escheoir*, the old French form of the verb *échoir*, 'to fall'), is defined by Sir William Blackstone as an obstruction to the course of descent by some unforeseen contingency which consequently determines the tenure. In this case the land results back by a kind of reversion to the original grantor or lord of whom it is holden.

Escheat takes place when the tenant of lands dies intestate and without an heir: in such case the lands, if freehold, escheat to the king, or other lord of the fee; if copyhold, to the lord of the manor. Lands which have descended to the last tenant from a paternal or maternal ancestor, escheat, if there are no heirs on the part of that ancestor from whom the lands descended. Since the 1st day of January, 1834, there can be no escheat on failure of the whole blood, wherever there are persons of the half-blood capable of inheriting under 3 & 4 Will. IV., c. 106.

If a bastard dies intestate and without issue, his lands escheat to the lord of whom they are held.

Escheat also takes place upon attainder for treason and murder, by means of which the blood is in law considered to be corrupted, and the attainted owner of lands rendered incapable of holding them himself, or transferring them by descent. In consequence of this extinction of heritable blood, the lands of such felons revest in the lord, except in cases of treason, when a superior law intervenes, and they become forfeited to the crown. Previously to a recent act (3 & 4 William IV., c. 106), a person could not trace his descent through another person who had been attainted; but this may now be done, provided that other person shall have died before such descent shall have taken place. [ATTAINDER.] And by the 4 & 5 William IV., c. 23, no property vested in any trustee or mortgagee shall escheat or be forfeited by reason of the attainder or conviction for any offence of such trustee or mortgagee, except so far as such trustee or mortgagee may have a beneficial interest in such property.

This doctrine of escheat consequent upon the commission of certain crimes is derived from the feudal law, by which a vassal was only permitted to hold real property upon condition of well demeaning himself.

The doctrine of escheats, with regard to extinct successions, seems to have been adopted in every civilized country to avoid the confusion which would otherwise arise from the circumstance of any property becoming common; and the sovereign power, or those who claim under it, are consequently the ultimate heirs to every inheritance to which no other title can be found.

ESCHEATOR, an antient officer appointed by the lord treasurer, and so called because his office was to look after escheats, wardships, and other casualties belonging to the crown.

There were at first only two escheators throughout England, one on this side and the other beyond the Trent; but in the reign of King Edward III. there was one appointed for every county, who was to continue in office for one year only. This office has now ceased to exist. (Blackstone's *Commentaries;* Wooddesson's *Lectures.*)

ESCHSCHO'LTZIA, a genus of beautiful yellow-flowered papaveraceous plants, inhabiting California and the north-western coast of North America, and now become extremely common in the gardens of Great Britain. They are known by the base of their calyx remaining at the base of the siliquose fruit in the form of a firm fleshy rim, by their calyx being thrown off like a calyptra when the petals unfold, and by the stamens being inserted into the edge of the permanent rim of the calyx. Otherwise they are very near our sea-shore Glaucium. Two certain species only, *E. Californica* and *E. crocea*, have yet been introduced; a third, *E. compacta*, is figured in the 'Botanical Register,' but it is probably a mule between the two first. It has been recently proposed to alter this name, which has a barbarous sound and appearance, for the more harmonious one of Chryseis, and it is hardly to be doubted that the latter will be adopted. (*Botanical Register*, t. 1948.)

ESCHWEGE. [HESSE, LOWER.]

ESCUAGE, or **SCUTAGE**, a pecuniary payment, by way of commutation for knight-service, whereby the tenant was bound to follow his lord into the wars at his own charge. The term escuage or scutage is from the old French *escu*, and that from the Latin *scutum*, 'a shield;' a name also given to coins on which there was the shield or escutcheon of the sovereign.

The personal attendance in knight-service growing troublesome and inconvenient in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time by making a pecuniary satisfaction to the lords in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight's fee; and therefore this kind of tenure was called *scutagium* in Latin, or *servitium scuti;* as being a pecuniary substitute for personal service. The first time this appears to have been taken was in the 5th Hen. II., on account of his expedition to Toulouse; but it soon came to be so universal, that personal attendance fell into disuse. Hence we find in our antient histories that, from this period, when our kings went to war, they levied scutages on their tenants, that is, on all the landholders of the kingdom, to defray their expenses, and to hire troops: and these assessments, in the time of Henry II., seem to have been made arbitrarily and at the king's pleasure. This prerogative being greatly abused by his successors, it became matter of national complaint, and King John was obliged to consent, by his *magna charta* (c. 12), that no scutage should be imposed without consent of parliament. But this clause was omitted in his son Henry III.'s charter; where we only find (c. 37) that scutages or escuage should be taken as they were used to be taken in the time of Henry II.; that is, in a reasonable and moderate manner. Yet afterwards, by statute 25 Edw. I. c. 5 and 6, and many subsequent statutes, it was enacted, that the king should take no aids or tasks but by the common assent of the realm. Hence it is held in our old books, that escuage or scutage could not be levied but by consent of parliament (*Old Ten.* tit. *Escuage*), such scutages being indeed the groundwork of all succeeding subsidies, and of the land-tax of later times. (Jacob's *Law Dictionary*, in voce; Blackstone's *Comment.* vol. ii. pp. 74, 75.)

ESCULA'PIUS. [ÆSCULAPIUS.]

ESCULIC ACID, a peculiar acid procured from horse-chestnuts. This acid is colourless, insoluble in water, but dissolved by alcohol, and is deposited from it in crystalline grains. It forms with bases salts termed *esculates*, but they are quite unimportant. Esculic acid consists of 8·35 hydrogen, 57·26 carbon, and 34·39 oxygen, in 100 parts.

ESCURIAL, or **ESCORIAL**, a vast edifice in the kingdom of Toledo, situated seven leagues from Madrid in a north-west direction. The term escorial is considered by some to be Arabic, meaning a place full of rocks, but by others is derived from *scoria ferri*, iron dross, from the circumstance of there having been antiently great iron works near this place. The situation is rocky and barren, devoid of all vegetable matter, except what has been conveyed there by man; and it appears to have been chosen for the advantage of procuring stone. The edifice was begun by Philip II., five years after the battle of St. Quintin, fought on the anniversary of St. Lawrence (both of which circumstances it was intended to commemorate) and was finished in twenty-two years. This extensive building is laid out, on its ground plan, in the form of a gridiron, a part (which forms the royal residence) advancing to form the handle, attached to a long rectangle forming several courts and quadrangles. This part is 640 by 580 feet, and the average height to the roof is 60 feet. At each angle is a square tower 200 feet high. The plan is divided so as to form a convent with cloisters, two colleges, one for the clergy and one for seculars, the royal palace, three chapter houses, three libraries with about 30,000 volumes and some valuable MSS., five great halls, six dormitories, three halls in the hospital, with twenty-seven other halls for various purposes, nine refectories, and five infirmaries, with apartments for artisans and mechanics. There are no less than eighty staircases. The gardens and parks, formed by art, are decorated with fountains.

The monks of the order of St. Jerome were 200 in number, and had a revenue of 12,000*l.* per annum.

The stone of which the building is constructed is white, with dark grey spots. The windows on the outside are 1110 and within 1578; of the former 200 are placed in the west front and 366 in the east. Including the out-offices, there are not less than 4000 windows. There are fourteen entrances or gateways, which have pretensions to architectural decoration, and 86 fountains.

The church is 374 feet long and 230 broad, and is divided into seven aisles. It is crowned with a dome 330 feet high from the ground, and is paved with black marble. In the church are forty chapels with their altars. In the palace and in the church there is a profusion of gilded bronze work and incrustation of marbles. There are numerous paintings by the great masters in the Escurial. It is possible however that these may have been removed to the Royal Museum at Madrid, formed by the late King Ferdinand. (*Spain Revisited*, cap. 13, vol. i.) The sculpture is said not to have any great merit. Philip IV. added a beautiful mausoleum 36 feet in diameter and incrusted with marbles: the design is in imitation of the Pantheon at Rome. The cost of the Escurial was six millions of piastres. For some curious details of the Escurial see 'The Escurial, or that wonder of the world for architecture and magnificence of structure, &c., translated into English by a servant of the earl of Sandwich in his extraordinary embassie thither,' Lond., 1671. From the title-page it appears that there was a report in 1671 that the Escurial had been destroyed by fire. There was a similar report a few years since.

ESCUTCHEON or **ESCOCHEON**, the heraldic term for the shield, on which, under every variety of shape, arms are emblazoned. The word is derived from the French *écusson*, and that from the Latin *scutum*. The first representation of arms was, no doubt, as an ornament to the shield. The shield afterwards became the appropriate and legitimate instrument for displaying them; hence in sculpture and painting they were never separated; and when shields ceased to be employed, their form remained, and still continues to be the field on which coat-armour is invariably depicted. An *escutcheon of pretence* is the small shield in the centre of his own, on which a man carries the coat of his wife, if she is an heiress and he has issue by her. In this case the surviving issue will bear both coats quarterly.

ESNE. [EGYPT, p. 312.]

ESOTERIC. [EXOTERIC.]

ESPALIER, a trellis for training fruit trees or bushes upon, instead of nailing them to walls.

In certain situations this kind of training is not only extremely neat but possesses peculiar advantages: the trees are more fully exposed to the influence of light, less liable

to be broken by high winds, and in small gardens in particular, where room is of great importance, and where a collection of the finer sorts of fruit is always desirable, it is found highly useful, both on account of the small space which the trees occupy, and because they will bear fruit much sooner than when allowed to grow in their natural form.

In France and other parts of the Continent this kind of training is very much practised, and in the northern parts of England and in Scotland, where the borders of the kitchen-garden are frequently planted with flowers, in order to combine pleasure with utility, espaliers are trained along the back of the flower borders to prevent the vegetables being seen from the walks.

When the espalier is fastened to a wall, as is very common on the Continent, peach and nectarine trees are frequently trained upon it; but where it is detached, as it is most commonly in Britain, apples and pears, and sometimes gooseberries, are the only fruits which are successfully cultivated in this way. Plums and cherries are occasionally so managed, but not so advantageously as the others.

When a common espalier is to be covered, the trees should be planted from 20 to 24 feet apart, which will allow the branches to grow 10 or 12 feet on each side: but as a considerable time would elapse before they would fill this space, a duplicate tree may be planted between each, and cut away as the others grow. Gooseberries of course require a small space; three or four feet from plant to plant is sufficient.

The training on espalier is very simple, and easily performed. When the trees are young, one shoot must be trained perpendicularly, and two others horizontally, one from each side; the two last must not be shortened, but the perpendicular shoot is to be shortened in the following year to three good buds, two of which are to form new side branches, and the other a leader as before; and so on every year until the trees have attained the desired size. The proper distance between the horizontal branches must depend upon the peculiar growth of the tree, but from six to nine inches is what is generally allowed. Trees are sometimes trained upon a double espalier which has the advantage of giving two surfaces to train upon. It consists of two trellises instead of one, about two feet apart at the bottom, and approaching at the top.

The only kind of espalier worth notice, which differs from those now mentioned is a table-rail: this, the management of which is called table training, consists of rails resembling tables, up the centre of which the tree is trained and regularly spread over the surface. It is rarely employed, and has the essential fault of exposing the blossom so much to the effect of nocturnal radiation that in this country a crop is rarely obtained from such espaliers.

The stakes which form the espalier are made of different materials, some of wood, others of wire and wood, and some of cast iron. The first of these is by far the most simple, and is composed of stakes, five or six feet in height, driven into the ground from one to two feet apart; along the top a bar, which is nailed to each, connects the whole together. It is of no use to have the stakes either so strong or so high when the trees are first planted, because they are not required, are unsightly, and will have to be renewed before the trees have attained their intended height; for this reason, stakes of a much weaker kind will at first answer quite as well. The wire and wood rail is formed by strong vertical wires, strained from two wooden horizontal rails, which are connected and held fast by wooden posts let into the ground. The iron rail is constructed upon the same plan as a common street railing.

The objection to all iron trellises is, that they cut and canker the trees; and when the cheapness of the wooden one is considered, besides the more natural appearance which it presents, it must undoubtedly have the preference.

The best wood for this purpose is young larch, the thinning of plantations.

ESPALION, a town in the department of Aveyron, in France. It is on the left or south bank of the river Lot, 17 miles from Rhodez, the capital of the department, and 339 from Paris by Fontainebleau, Briare, Nevers, Moulins, Riom, Clermont, and St. Flour. The principal street of the town is broad, and lined with well-built houses; it leads down to the bridge over the Lot. The population in 1832 was [illegible] for the town, or 3545 for the whole commune. The inhabitants manufacture light woollen stuffs, and there are several tan-yards: morocco leather is manufactured. Good wine is produced in the country round Espalion. The town has a subordinate court of justice (*tribunal de première instance*), a high-school, and a drawing-school.

The arrondissement of Espalion is subdivided into nine cantons or districts, under the jurisdiction of a justice of the peace, and 101 communes: it had in 1832 a population of 65,086.

ESPIRITU SANTO. [BRAZIL, p. 336; CUBA, p. 205.]

ESPRIT, SAINT, a suburb of Bayonne. [BAYONNE.]

ESPLANADE, the ground between the fortifications of a citadel and those of the town to which it belongs. It is recommended by writers on fortification that this space should be about 300 fathoms broad, reckoning from the covered way of the citadel, that in the event of an attack on the latter the enemy may not construct batteries within breaching distance under the cover afforded by the buildings of the town.

ESQUILINE HILL. [ROME.]

ESQUIMAUX, a nation inhabiting the most northern countries of America, and, if the extent of country be considered, one of the most widely-spread nations on the globe. On the eastern coast of America they are met with as far south as 50° N. lat. on the shores of the Strait of Belle Isle, which separates Newfoundland from the mainland of America. They occupy the whole of the great peninsula of Labrador and the whole eastern coast of Hudson's Bay up to East Main River. On the western side of Hudson's Bay they inhabit the coast north of Churchill River, whence they extend northwards over the Barren Lands to the Great Fish River, or Thleweechodezeth, on both banks of which river they are found east of 100° E. long. The whole country between this river, the Great Bear Lake, the Mackenzie River, and the Arctic Ocean, is exclusively inhabited by them. The coast lying to the west of Mackenzie River is also in their possession; and they seem to be spread as far as Kotzebue Sound, on Behring's Straits. They also occupy Greenland and all the other islands between the northern coast of America and the pole, as far as they are habitable.

In stature the Esquimaux are inferior to the generality of Europeans. A person is rarely seen who exceeds 5 feet in height. Their faces are broad, and approach more to the rounded form than those of Europeans; their cheek-bones are high, their cheeks round and plump, mouth large, and lips thick. The nose is small, and, according to some authors, flat, which, however, is denied by others. Their eyes are in general of a deep black; but some are of a dark chestnut colour; they appear very small and deeply seated, owing to the eye-lids being much encumbered with fat. The hair is uniformly long, lank, and of a jet black colour. The ears are situated far back on the head. Their bodies are large, square, and robust, the chest high, and shoulders very broad. Their hands and feet are remarkably small; there is, however, no sudden diminution, both extremities appearing to taper from above downwards in a wedge-like shape. Graah, in his 'Voyage to Greenland,' observes that the inhabitants of the eastern coast have disproportionately large hands and feet. They are of a deep tawny or rather copper-coloured complexion. They are not without beard, as it has been asserted, but they pluck it out as soon as it appears. Some of them even wear long beards. They show a good deal of ingenuity in making their dresses and instruments; and some of them have attracted the attention of our travellers by their display of mental powers.

Their language is different from that spoken by the other savage nations who inhabit North America; but it seems that the same language is spoken by all the different tribes of the Esquimaux, though of course each of them has expressions which are peculiar. (Parry; Mac Keevor; Graah's *Voyage to Greenland*.)

ESQUIRE (from the French, *écuier*, or shield bearer) is the next title of dignity to that of knight. The esquire was the second in rank of the [illegible] to chivalry, or knighthood, and had his name from carrying the shield of the knight, whose bachelor, or apprentice in arms, he was. The gradations of this service, or apprenticeship to arms, were, page, esquire or bachelor, and knight, who, in his turn, after the formation of degrees of knighthood, was called a knight bachelor, as aspiring to the higher honours of chivalry. The esquire was a gentleman, and had the right of bearing arms on his escutcheon or shield; he had

also the right of bearing a sword, which denoted nobility or chivalry, though it was not girded by the knightly belt; he had also a particular species of defensive armour which was distinguished from the full panoply of the knight. So much for the esquire of chivalry, which order is only preserved in the almost obsolete esquires for the king's body, whom antiquaries have pronounced to be the king's esquires in chivalry (that is, his esquires, as being a knight), and in the esquires of knights of the Bath.

There was also another class, who may be called feudal esquires, and consisted of those tenants by knight's service who had a right to claim knighthood, but had never been dubbed. They were in Germany called *ritters*, or knights, but were distinguished from the actual knights, who were called dubbed knights, or *Ritter Geschlagen*, and had many of the privileges of knighthood. This distinction still exists in many of the countries which formed part of the German empire. In Hainault, Brabant, and other provinces of what was Austrian Flanders, the antient untitled nobility, or gentry as they are called in England, to this day are styled collectively the *Ordre Equestre*, or knightly order. It also existed in England until James the First had prostituted the honour of knighthood, for Camden frequently speaks of knightly families (*familias equestres*, or *familias ordinis equestris*), where the heads of them were not, at the time, actual knights. Writers on precedence make mention of esquires by creation, with investiture of a silver collar or chain of *ss*, and silver spurs: but these seem to have been only the insignia of the esquires for the king's body, which being preserved in a family as heir looms, descended with the title of esquire to the eldest sons in succession. The sons of younger sons of dukes and marquesses, the younger sons of earls, viscounts, and barons, and their eldest sons, with the eldest sons of baronets, and of knights of all the orders, are all said to be esquires by birth, though their precedence, which differs widely, is regulated by the rank of their respective ancestors. Officers of the king's court and household, and of his navy and army, down to the captain inclusive, doctors of law, barristers, and physicians, are reputed esquires. A justice of the peace is only an esquire during the time that he is in the commission of the peace, but a sheriff of a county is an esquire for life. The general assumption of this title by those who are not, in strictness, entitled to it, has virtually destroyed it as a distinct title or dignity. The heads of many old families are, however, still deemed esquires by prescription.

ESSAYISTS, BRITISH. This title is customarily confined to a certain class of periodical writers upon subjects of general interest, as morals, criticism, manners, &c. The notion of a series of papers fit for general circulation, and not including news or politics, was originated by Steele and Addison in the 'Tatler.' [ADDISON.] The 'Freeholder,' 'Craftsman,' 'Freethinker,' &c., now almost forgotten, were rather political pamphlets than essays in this sense of the word; and an interval of thirty-five years elapsed from the end of the 'Spectator' to the successful revival of this style of writing by Dr. Johnson, in the 'Rambler,' in 1750. Its great popularity led to the establishment of a number of similar periodicals during the latter half of the eighteenth century, since which time they have again gone out of fashion. We give a list of those contained in Alexander Chalmers's collective edition of British Essayists, which includes some that have little claim to a place among the standard works of our language; with the names of the principal and most celebrated contributors to each.

'Tatler'—Steele, Addison.
'Spectator'—Addison, Steele, Budgell, Pope, &c.
'Guardian'—Steele, Addison, Berkeley, Pope, Tickell, Gay, &c.
'Rambler'—Johnson, almost entirely.
'Adventurer'—Hawkesworth, Johnson, Jos. Warton, &c.
'World'—Moore, Lord Chesterfield, Horace Walpole, J. Warton, &c.
'Connoisseur'—G. Colman and Bonnel Thornton chiefly; Cowper a few.
'Idler'—Johnson; a few by Warton and others.
'Mirror'—Henry Mackenzie and others.
'Lounger'—The same.
'Observer'—Richard Cumberland, almost entirely.
'Olla Podrida'—Moore, &c.
'Microcosm'—Canning, Frere, Smith, &c.

ESSEK, ESZEK, ESSEG, or OSZEK, the chief town of the circle of Essek, and the capital of Austrian Sclavonia, is a royal free town situated in a level and marshy district on the right bank of the Drave, a little to the west of its efflux into the Danube. It lies in 45° 34′ N. lat., and 18° 42′ E. long. Its site is that of the Mursia, or Mursa of the Romans, which was founded in the year 125 by the emperor Hadrian, and afterwards became the residence of the Roman governors of Lower Pannonia. Constantine made it the seat of a bishopric in the year 335. It now consists of four quarters; the present fortress, begun under the emperor Leopold I. in 1712, and finished in 1719, is well built, contains 147 handsome and lofty houses, an arsenal and barrack, and is regularly fortified: an esplanade runs round it, and to the north-west of it stands the Felso-Varos (Upper Town), which is approached by an avenue 1100 paces long, is the residence of the merchants and dealers, and has well-attended fairs. South-east of the fortress lies the Also-Varos, or Lower Town, the site of the antient Mursa, which consists of broad and handsome streets, and has some fine churches; and in the east is the New Town, composed rather of farms and gardens than of lines of streets. The fortress and suburbs contain altogether about 1800 houses, 5 Roman Catholic churches, 4 chapels, and a church for those of the Greek persuasion, and 11,200 inhabitants. There are several handsome buildings, such as the town-hall, the house of assembly for the states of Verócz, the county in which Essek is situated, the barracks, engineers' house, officers' pavilion, and arsenal. Essek has a Roman Catholic high-school, a gymnasium, a Greek school, a military cadet academy, and a Franciscan and a Capuchin monastery. A causeway or bridge about two miles and a half in length, 55 feet in breadth, and 9 feet in height, constructed in the year 1712, leads across the Drave and the swamps on its northern bank into the Hungarian county of Baranya. With the exception of some silk-spinning there is little mechanical industry in the town. There is a considerable trade in grain, cattle, and raw hides.

ESSEN, a township in the Prussian administrative circle of Düsseldorf, consisting of the town of Essen only, which lies on the Berne, in 51° 27′ N. lat., and 7° 2′ E. long. It was the spot where the foreign princes of the Rhine and of Westphalia formerly held their diets, or 'Fürstentage.' Essen is surrounded by walls, has about 830 houses, and the population, which was 4706 in the year 1817, is now about 5700. It is the seat of mining and crown-domain boards, and has 2 Protestant and 2 Roman Catholic churches, a gymnasium, a Capuchin monastery, a Protestant orphan asylum, and a hospital. The chapel of St. Quirinus is supposed to be the first place of Christian worship erected in these parts. The manufactures consist of woollens, linens, vitriol, leather, arms, iron and steel ware, &c. The town has some trade, and there are coal-mines in the vicinity, as well as a number of iron works.

ESSENCE is derived from the Latin *essentia*, a word which is used by Cicero and Quinctilian, and formed, not as stated in Mr. Richardson's Dictionary, from *existentia*, but from *essens*, the analogous but obsolete participle of the verb *esse*, to be. The English word essence consequently signifies that which constitutes the being of a thing, or, in the words of Locke, that which makes it to be what it is. This term was the subject of many very subtle disquisitions and disputes among the scholastic logicians of the fourteenth, fifteenth, and sixteenth centuries; and the metaphysical notions of essence entertained by these logical doctors cannot be understood without reference to their discussions respecting the nature of universal ideas, as real or nominal, of abstraction, genus, species, differentia, substance, properties, accidents, &c., of all which particulars may be found in Smiglecii Logic. Disputat.; Burgersdicii Logica: Eustachii Logica; Le Grand, Institut. Logic.; Wallisii Logica; and in many other logical and philosophical treatises cited in Johnson's Quæstiones Philosophicæ, p. 168, &c. Some amusing instances of metaphysical sagacity concerning logical essence are exhibited in the scholastic work of Louis de Lesclache, 'La Philosophie, divisée en cinque Parties,' 1548. 'Il n'y a rien dans la substance qui ait moins d'essence que la substance; aussi il n'y a rien dans la substance qui soit moins substance que la substance,' &c. In the Oxford Manual of Scholastic Logic, by Dr. Aldrich, as expounded by Mr Huyshe, it is taught, in accordance with the theory of the Nominalists, that essence is not really existent, but is merely a figment of imagination, and that the notion of it is resolvable into two parts; that which is common to other

essences being called the *genus*, and that which is peculiar to one particular essence, distinguishing it from all others and constituting it what it is, being called the *differentia*. The whole essence is called the species; that is, genus + differentia = species. The qualities joined to essence are also of two kinds; those which are joined necessarily are called *properties*, and those which are joined only contingently are called *accidents*. Hence the five predicables, or only possible parts of a thing which can be the objects of assertion:—1. Species or whole essence. 2. Genus, the common or material part of the essence. 3. Differentia, the peculiar or formal part of the essence. 4. Property or quality, necessarily joined to the essence. 5. Accident, or quality contingently joined to the essence. The following statements, collected from Locke (*Essay*, book iii., c. 3 and 6), exhibit the principal points of his doctrine of essence. He considers essence to be of two kinds: 1. The real essence, which constitutes the insensible parts of a thing, and is wholly unknown to us. 2. The nominal essence, which depends on that which is real, and is the complex idea, for instance, of the properties of colour, weight, malleability, fixedness, fusibility, &c., expressed by the word gold; for nothing can be gold which has not the qualities conceived in the abstract idea to which this name is applied. In simple ideas (see book ii. c. 2), the real and nominal essence are identical, but in substances they are always different. Each of the distinct abstract ideas which men make and settle in their minds by giving them names is a distinct essence; and the names which stand for such distinct ideas are the names of things essentially different. Thus, a circle is as essentially different from an oval as a sheep from a goat; the abstract idea which is the essence of one being impossible to be communicated to the other. As essences are nothing but the abstract complex ideas to each of which has been annexed a distinct and general name, and as of such ideas there are some which correspond to no reality in nature—for instance, those of mermaids, unicorns, &c.—it is evident that there are essences of things which have no existence. In considering essence with regard to the scholastic theory of genus and species, Locke observes that we classify things by their nominal essences, having no other measure of essence and species but our abstract general ideas or mental archetypes, without reference to which we cannot intelligibly speak of essential and specific difference. The doctrine of the immutability and ingenerable incorruptible nature of essences can be founded, says Locke, only on the relation between abstract ideas and the sounds by which they are signified; that is, on the fact that the same name retains the same signification, and also on the fact that, whatever may become of individuals, as Alexander and Bucephalus, the ideas of man and horse remain unaltered. Some of these positions, as that real essences are unknown, and that species are distinguished by essences merely nominal, are disputed in Green's Philosophy and Lee's work against Locke. (See also many of the earlier scholastics; and for an exposition of the doctrine of essence, according to the transcendental theory, see Kant's 'Kritik der reinen Vernunft' and Wirgman's Logic and Metaphysics, in the 'Encyclopædia Londinensis.') Substance, as distinguished from essence, is understood to mean all the essential, with the accidental qualities; and essence (genus and differentia, or common and proper) the essential qualities alone, that is, the pure substance, or metaphysical substratum. The Greek word *ousia* (*οὐσία*) has many significations applicable to the individual, genus, species, and subject (Aristotle, *Metaphys.* l. 6, c. 3); on which it is remarked by Roy Collard (*Essai sur la Psychologie*, 1826, p. 149. 246), that while the Latin and all modern languages have two distinct expressions for essence and substance, it is surprising that the Greek, which is otherwise so rich, had only one name (*οὐσία*) for these two ideas. The word *ὑπόστασις*, *hypostasis* (substance), was subsequently employed, but with similar duplicity and confusion. Hence arose many of the Trinitarian controversies, or rather logomachies, which embroiled the first ages of the church; for Athanasius, Epiphanius, and most of the other Greek fathers understood *πρόσωπον*, person or mode of being, as meaning the same thing as *ὑπόστασις*, substance; and Sabellius, Arius, Nestorius, and Eutyches understood *ὑπόστασις* as signifying the same thing as *οὐσία*, that is, essence or nature. So that Sabellius said, there is one essence or nature in God, *therefore* one substance or person. There are three substances or persons in God, said Arius, *therefore* three essences or natures. There are two essences or natures in Christ, said Nestorius, *therefore* two substances or persons. There is but one substance or person in Christ, said Eutyches, *therefore* but one essence or nature. The essay on the difference between *οὐσία* and *ὑπόστασις*, essence and substance, which is often attributed to St. Gregory, appears to belong rather to St. Basil; at least it is contained in his 43rd epistle. The epithet *essential* denotes those indispensable qualities in a thing, without which it could not be what it is; and the name *essentials*, as the essentials of logic, signifies those parts alone which are valid for general or particular uses.

ESSENES. [HESSENES.]

ESSEQUIBO. [GUIANA, BRITISH.]

ESSEX, an English county, situated on the eastern coast of the island of Great Britain. It is of irregular form, approximating to the quadrant of a circle, of which the north-western point of the county may be considered as the centre; the southern, south-eastern, and eastern sides a portion of the circumference; and the northern and western sides the circumscribing radii. It is bounded on the north by the county of Suffolk (from which it is separated by the river Stour) and by the county of Cambridge (from which it is separated for a very short distance by the river Cam); on the west by the county of Herts (from which it is separated, along a part of the boundary-line, by the river Stort, a feeder of the Lea, and by the river Lea); and by the county of Middlesex (from which it is separated throughout by the Lea, which joins the Thames at the south-western extremity of the county); on the south side and on a portion of the south-east side it is bounded by the gradually widening æstuary of the Thames, by which it is separated from the county of Kent; and on the remainder of the south-east side and on the east side by the German Ocean. The length of a straight line drawn from the north-western to the north-eastern extremity of the county, is 53 miles; but the northern boundary of the county, following its turnings, is about 75 miles; the length of a line joining the north-western with the south-western extremity, is 37 miles; but the boundary-line, from its many windings, extends to 53 miles. The length of a line joining the south-western to the north-eastern extremity of the county (which would be the chord of the circumscribing arc of the quadrant) is 63 miles; but the boundary along the bank of the Thames and the coast of the ocean is about 85 miles. The area of the county is estimated at 1533 square miles; or, taking the estimated areas of the several parishes, 979,000 acres. The population, according to the return of 1831, was 317,507, giving 207 to a square mile. In magnitude it is the tenth of the English counties, being a little smaller than Kent, and a little larger than Suffolk. In absolute population it is the thirteenth, and in relative population the eighteenth, of the English counties. Chelmsford, the county-town, is on the river Chelmer, 29 miles from St. Paul's, London, in a straight line north-east by east; and the same distance from Whitechapel Church, London, by the road through Romford, Brentwood, and Ingatestone. (*Ordnance Survey.*)

Coast, Islands, &c.—The bank of the Thames and the sea-coast of Essex are marshy almost throughout. From the junction of the Lea with the Thames to Purfleet, 11 or 12 miles, the marshes extend from a mile to a mile and a half or even two miles inland, and the river is confined to its bed by an embankment. At Purfleet the hills come down to the river; and from Purfleet to Grays Thurrock, 5 miles, the marshes consist only of a very narrow strip along the river-bank; the embankment is, however, carried on, except just at Purfleet. West and East Tilbury marshes, on each side of Tilbury Fort, extend 6 miles along the river, and from one to two miles inland; but below them the breadth of the marsh land is again contracted, along that bend of the river called The Hope, 3 miles long, from the lower end of which they again widen, and extend above 9 miles along the river, and nearly 4 miles inland, being intersected by an inlet called Hole Haven, the branches of which cut off from the mainland the low marshy Isle of Canvey. The embankment of the river is carried round the inlet of Hole Haven, along the bank of the creek which separates Canvey Island from the main, and round the whole of Canvey Island; those portions of the marsh-land which are not comprehended within the embankment are, below Tilbury Fort, salt marshes. From the eastern end of Canvey Island the marshes cease; and about Leigh

and Southend the coast rises into low cliffs. At Shoebury Ness, a low point of land at the mouth of the Thames, 6 miles from the east end of Canvey Island, where the coast turns to the north-east, the marshes reappear; and with an interval of about a mile just beyond Shoebury, they continue along the coast 11 miles to the mouth of the river Crouch. Nearly 4 miles from Shoebury a narrow creek, with many ramifications, penetrates inland into the channel of the river Crouch, and with that river cuts off from the mainland several low flat islands, Russelys, Haven Gore, New England, Potten, Wallasea, and Foulness. The edge of this creek and its various ramifications, as well as of the Broomhill and Crouch rivers, which unite with it, are embanked, and the islands are embanked all round. The marshy tract, including the islands and the adjacent part of the mainland, is from 3 to nearly 6 miles broad; and the sand (Foulness Sand), dry at low water, which at Shoebury Ness was a mile and a quarter broad (having widened from a quarter of a mile at Hole Haven), is off Foulness Island 4 miles broad; there is a road along this sand from Kennet's Head, near Shoebury, almost to the north-eastern end of Foulness Island. From the mouth of the Crouch the coast runs nearly north and south 8 miles to the mouth of the Blackwater river. In this part of the coast the sea encroaches upon the land. The marshes (Burnham Marsh, Southminster Marsh, Dengey Marsh, Tillingham Marsh, and Bradwell Marsh) extend in the southern parts nearly 5 miles inland, but gradually become narrow to the northward to St. Peter's Chapel, where they are interrupted by the higher ground running down to the coast; the sand, which is dry at low water, has a breadth of from two miles to two miles and a half. Between the æstuaries of the Blackwater and the Colne, in the inlet formed by their junction, the mouth of which inlet, from St. Peter's Chapel to St. Osyth Point, is above 5 miles over, is the island of Mersey, separated from the main by a marshy tract and an intervening narrow channel. The outer or seaward shore of this island is skirted by a very narrow tract of marsh-land; but the marshes about St. Osyth Point are from three-quarters of a mile to a mile broad. The marshes, however, terminate 4 miles beyond St. Osyth's Point, and (with a slight interruption of a mile of marsh-land near the mouth of Holland Creek) a high broken coast extends between 9 and 10 miles to the Naze, the most eastern point of the county. This point formerly extended much farther toward the east. The ruins of buildings have been found at considerable distances from land; and a shoal called West Rock is 5 miles from shore. From the Naze to Harwich, between 5 and 6 miles in a direct line north and south, the coast forms an inlet lined by salt marshes, and occupied by Horsey Island, Holmes Island, Pewit Island, and one or two smaller islands. The sea-coast terminates at Harwich; but the æstuary of the Stour, which is in most parts more than a mile wide at high water, extends up to Catawade Bridge, above Manningtree. (*Ordnance Survey.*)

The islands have been named in the course of the foregoing description of the coast: we subjoin a few particulars of the chief of them.

Canvey Island is bounded on the south-west and west by Hole Haven, and on the north by a narrow creek, which separates it from the mainland. It is entirely marsh-land, banked in all round. Its extreme length from east to west is 6 miles; its greatest breadth from north to south 2½. Its area is estimated at more than 2600 acres (*Lib. of Useful Knowledge: Geography*), chiefly appropriated to grazing sheep and cattle; or 3600 acres (Morant's *Hist. of Essex*). It is connected with the mainland by a causeway leading to the village of South Benfleet. It does not form a distinct parish, but pays tithes and rates to several parishes. From its being comprehended in so many parishes, its population cannot be ascertained from the population returns; but the 'Clerical Guide' (A.D. 1836) assigns to it a population of 216. Morant, in his 'History of Essex,' states that there were then (A.D. 1768) fifty dwellings in the island. In 1622, the land being subject to be overflowed at high water in the spring tides, the owners of lands in it entered into an agreement with Joas Croppenburgh, a Dutchman, for 'inning and recovering the island,' as Morant terms it. A timber chapel was built for the use of the Dutchmen employed in the work. This chapel has been twice rebuilt: the present chapel will hold 100 persons. The value of the perpetual curacy, to which several endowments are attached, is 58*l.*; it is in the gift of the bishop of London. There is a yearly [illegible] island.

Foulness Island (so called from the Saxon Fugel, a fowl, and næse, a promontory, 'the Promontory of Fowls') is bounded on the north by the river Crouch, on the east and south-east by the German Ocean, on the west by the Broomhill river, which separates it from Wallasea Island, and on the south-west by a creek which communicates between this river and the sea and separates Foulness from Potten and New England Islands. Its extreme length, from north-east to south-west, is almost 6 miles; its greatest breadth 2½. Its area is given by Morant at 4500 acres, and in the 'Lib. of Useful Knowledge' at 5000; but in the Population Returns, Foulness parish, which does not, so far as we know, comprehend more than the island, is given at 8060 acres, with a population of 630, almost entirely agricultural. The soil is good, the upper part producing corn of every kind, and the lower part pasturage: the only fences are ditches, which are filled at every tide. Fruit-trees thrive ill. The water is brackish; the only fresh water is rain-water. The houses are scattered over the island, upon the different farms; they are all of wood—a material which, from some cause or other, is here liable to rapid decay. The church, also of wood, is situated near the centre of the island; it will hold 300 persons. The living is a rectory, exempt from the archdeacon's jurisdiction, of the yearly value of 300*l.*, with a glebe-house. There is a yearly fair in the island. Beds of oyster and cockle-shells have been found beneath the surface of this island, which renders it probable that it was originally formed by deposits from the sea.

Wallasea, otherwise Wallet or Wallis, so named from the sea-walls which surround it, is bounded on the north by the river Crouch, on the east and south by the Broomhill river, which separates it from Foulness and Potten Islands, and on the west and south-west by Paglesham Creek, which separates it from the mainland. There is a causeway over Paglesham Creek. Its greatest length is, from east to west, 3½ miles; its greatest breadth is 1¼ miles. The water is too salt to be fit for kitchen use, and the inhabitants have to fetch fresh water from the mainland: that in the ponds is so brackish that horses do not thrive till they have been inured to it. The whole island is marsh-land; it is included in several parishes.

Potten Island, Haven Gore, New England, and Russelys or Rushley, belong to the same group as the two foregoing; they are to the south-west of Foulness and to the south of Wallasea. The whole group is in Rochford hundred. In the creeks which surround or separate these islands are fed the small oysters called Wallfleet oysters.

Mersey Island is in an inlet formed by the æstuaries of the Blackwater and the Colne. The name is derived from the Saxon Mere, the sea or a marsh, and ig, an island. It is bounded on the south by the æstuary of the Blackwater river, on the south-east by the German Ocean, on the east by the æstuary of the Colne, and on all other sides by a creek, which, running through the marshes on its north-west side, under the names of Mersey Channel or Pyefleet Channel, separates it from the mainland: a portion of the marsh on the north side of the island is separated from the rest by a channel called Passfleet. The greatest length of the island is, from east-north-east to west-south-west, nearly 5 miles; the breadth varies from one to two miles. The island is divided into the two parishes of East and West Mersey or Mersea, of which the former comprehends an area of 1810 acres, with a population, in 1831, of 300; the latter an area of 3020 acres, with a population of 847: together, 4830 acres and 1147 inhabitants. There is a passage from the island to the mainland over the Mersey Channel, dry at low water, called 'the Strode' or 'Stroude,' i. e., a bank along the side of a creek, river, or sea. The history and antiquities of this island will be noticed with those of the county at large.

Horsey Island is in that inlet which occurs between the Naze and Harwich. Its greatest length is from north-west to south-east about two miles: its greatest breadth rather more than a mile. It consists almost entirely of salt marshes: a spot rather more elevated than the rest, about one-fourth of the whole, on the south-west side of the island, is banked in. In the marshes there is a decoy for wild fowl.

Pewit Island and Holmes Island, with one or two others are near Horsey: all these islands are separated from each other and from the main by narrow channels.

Surface, Hydrography, Communications. This county has few hills of any considerable elevation: its general slope, as determined by the watershed, is towards the south and

east; the coast and the banks of the Thames present a succession of unhealthy marshes commonly known as the hundreds of Essex. High Beach, on the north-west side of Epping Forest, near Waltham Abbey (390 feet high), Langdon hill, south of Billericay (620 feet high), Danbury hill, between Chelmsford and Maldon, of nearly the same height, and Tiptrey Heath near Witham, are probably the highest parts of the county. The Chalk downs which form the continuation of the Chiltern hills just cross the north-western part of the county in their extension towards the north-east.

The rivers of Essex are—the Thames with its affluents, the Lea (into which flows the Stort), the Roding, the Bourne Brook, the Ingerburn, and some smaller streams; the Crouch with its affluent the Broom-hill; the Blackwater with its affluents the Pods Brook or Witham river; and the Chelmer (into which flow the Sandon Brook, the Ter, and some other streams); the Colne with its affluent the Roman; the Stour; and the Granta or Cam.

The Thames bounds the county on the south side. Its course, though winding, is on the whole nearly from west to east. It is a tide river, and navigable for the largest merchant ships (that is, for East Indiamen of the first class, 1400 tons burden), and for frigates and other smaller ships of war throughout that part of its course which belongs to this county. The mouth of the Thames contains numerous shoals.

The Lea bounds the county on part of its west side. It more properly belongs to Hertfordshire, in which it has a considerable part of its course. It meets the border of Essex at the point where it receives the Stort, along which the boundary previously runs and flows south past Broxbourn (Herts), Waltham Abbey, Chingford, Layton, and Stratford (all in Essex), 20 miles, into the Thames. The banks of this river are marshy; and the marshes are from half a mile to a mile wide. The stream is frequently divided and flows in several channels, and in some places cuts have been made in order to improve or shorten the navigation, which comprehends all that part of the river connected with this county. Some of the acts of parliament relating to the navigation of this river are above 400 years old.

The Stort rises in Hertfordshire, but soon enters Essex, through which it flows for some miles, and then touches the border again, and flows sometimes on the border, sometimes in Hertfordshire, into the Lea. Its whole course is about 24 miles, for about 10 miles of which it has been made navigable. The navigation of the Stort and the Lea serves for the conveyance of corn, malt, wool, and other agricultural produce to London; and for the conveyance in return of coals, timber, deals, bricks, paving stones, groceries, cloth, and other articles of daily consumption.

The Roding rises in the western part of the county, near Easton Park, a short distance north-west of Dunmow: it flows southward about 15 miles to the neighbourhood of Chipping Ongar, where it receives the Cripsey Brook (about 9 miles long) from the north-west. From the junction of the Cripsey Brook, the Roding flows south-west in a very winding channel 14 miles past Kelvedon Hatch, Navestock, Abidge, Loughton, and Chigwell, to Woodford bridge: and from Woodford bridge it flows about 7 or 8 miles south and south by east past Ilford and Barking into the Thames. Its whole course is about 36 or 37 miles. The banks are low and marshy from the neighbourhood of Ongar. The west bank, from Ilford, and both banks from below Barking, are protected by embankments. It is navigable under the name of Barking Creek up to Ilford bridge, and serves to convey coals and other articles for the supply of Romford and the neighbourhood.

The Bourne Brook rises between the villages of Navestock and Havering-atte-Bower, and flows in a winding channel past Romford (below which it receives a small brook from Hornchurch), and between Dagenham and Hornchurch Marshes into the Thames. Its length is about 12 miles. In the lower part of its course the Bourne Brook is connected with the pool formed by Dagenham Breach. This breach was occasioned in 1707 by the blowing up of a small sluice that had been made for the drainage of the land waters: an opening was formed by the rushing in of the Thames, 300 feet wide, and in some places 20 feet deep: 1000 acres of rich land in the adjacent levels were overflowed, and the surface of nearly 120 acres was washed into the Thames, where a bank was formed nearly a mile in length, and extending halfway across the river. After various ineffectual attempts, the breach (which in course of time had been, by the force of the reflux every turn of the tide, worn into several channels like the arms of a river) was stopped, by driving dove-tailed piles and other expedients, under the direction of Captain Perry, who commenced his works in 1718. Within the embankment there is yet a pool of between 40 and 50 acres, where the soil was carried away by the tide. [BARKING.] Through the upper part of this pool the Bourne Brook flows.

The Ingerburn rises near Havering-atte-Bower, not far from the source of the Bourne Brook, and flows southward, past Upminster, into the Thames. It is about 12 miles long. A stream of about the same length, which rises close to Thorndon Park near Brentwood, falls into the Thames near Purfleet.

The Crouch rises on the slope of the hills, south of Billericay, and flows east by north about 25 miles into the sea, passing the villages of Ramsden Cray, Wickford, Runwell, and much lower down, the village of Burnham. The tide flows about 13 miles up the river and is kept from overflowing the low lands on its banks by mounds. In the tideway there are many arms; and the various channels by which the river communicates with the sea form the group of Foulness, Wallasea, and the adjacent islands. Just above its mouth it receives the Broom-hill river (10 miles long), which is navigable for seven miles nearly up to Rochford.

The Blackwater, which in the upper part of its course is called the Pant, rises near the village of Wimbish, three or four miles from Saffron Walden, in the north-western part of the county. It flows first south-east and then south about 30 miles, past Redwinter, Great Sampford, Little Sampford, Great Bardfield, Weathersfield, Shalford, Panfield, Bocking, Stisted, Coggeshall, Kelvedon, Great Braxted, and Little Braxted, to the neighbourhood of Witham. Here it is joined by the Pods Brook, a stream 14 or 15 miles long, which rises near Great Bardfield and flows past Rayne, Braintree, Black Notley, White Notley, Faulkbourn, and Witham. From the junction of this stream the Blackwater flows south about 4 miles to the junction of the Chelmer; after which it flows east about 12 miles into the sea, having a course of about 46 miles. From Maldon, which is below the junction of the Chelmer, it is a tide river; and its estuary, which is at high-water from 1½ to 2½ miles wide, contains the islands of Northey, Osey, Ramsey, and Pewit. Lawling Creek and Goldhanger Creek are channels in the ooze or strand of this tideway.

The Chelmer rises near Debden, two or three miles south of the sources of the Blackwater, and flows south-south-east about 23 or 24 miles to the town of Chelmsford, passing Thaxted, Tiltey, Great Easton, Dunmow, Great Waltham, and Little Waltham. At Chelmsford it is joined by a stream which rises near Thorndon Park and flows northward between Billericay and Ingatestone to Widford and Writtle, and then turns east and runs into the Chelmer after a course of about 14 miles. From Chelmsford the Chelmer flows east about 10 miles till it falls into the Blackwater near Maldon. Its whole course is about 34 miles. The Sandon Brook, which rises near Stock, two miles north-east of Billericay, and has a course of about 10 miles, joins the Chelmer between Chelmsford and Maldon. The Ter rises between Felsted on the Chelmer and Rayne on the Pods Brook, and flows south-east 13 or 14 miles into the Chelmer, which it joins about two miles below the junction of the Sandon Brook. It passes Little Leighs, Great Leighs, Terling, and Hatfield Peverel.

The Colne rises in the north-western part of the county, between Great Sampford on the Pant, and Steeple Bumpstead on the Stour. It flows east about 7 miles to the neighbourhood of Great Yeldham, where it is joined by another stream of nearly the same length. From this junction it flows south-east 6 miles past Castle Hedingham and Sible Hedingham to Halsted; and from thence east-south-east about 13 miles to Colchester. Below Colchester it becomes a tidewater and flows 8 or 9 miles south-east into the sea at the north-east end of Mersey Island. Its whole course is about 35 miles.

The Roman rises about 2 miles north of Coggeshall on the Blackwater, and flows east by south about 13 miles into the tideway of the Colne, which it joins midway between Colchester and the sea. A brook eight or nine miles long from Layer Marney and Layer Breton joins the Roman about three miles above its junction with the Colne.

The Stour may be considered as equally belonging to Suffolk and Essex. Of the three springs which may claim to be its sources, one which flows past the village of Keddington is in Suffolk; a second in Cambridgeshire, and from it a stream flows by the town of Haveril in Suffolk; the third spring is in Essex, and the stream from it passes Steeple Bumpstead. From the junction of these three streams, which takes place about 6 or 8 miles from their respective sources, the river to its outfal divides the counties of Essex and Suffolk. Its course is first east about 10 miles past Wixoe, Stoke, Clare, and Cavendish in Suffolk, to the neighbourhood of Long Melford, above which it receives two small tributaries on the Suffolk bank; from thence its course is south by east about 8 miles past Sudbury in Suffolk to Bures: and from thence east 13 miles past Neyland, in Suffolk (below which it receives two considerable affluents), and Dedham in Essex to Catawade bridge, just above Manningtree. Below Catawade bridge the stream widens into a considerable æstuary, 11 or 12 miles long, and for the most part above a mile wide, which unites with the æstuary of the Orwell, a Suffolk river, and passes into the open sea between Harwich and Languard Fort. Its whole course is about 50 miles. Manningtree, Mistley, Wrabness, and Harwich are on the Essex bank of this æstuary.

The Cam rises near Debden, 4 miles from Saffron Walden, and flows first south-west for 2 miles, and then turns north and flows 8 or 9 miles past Newport, Audley Park, Littlebury, and Little and Great Chesterford, into Cambridgeshire, to which the principal part of its course belongs.

The Thames and the Lea are navigable throughout that part of their course which belongs to this county; the Stort is navigable from Bishop Stortford to its junction with the Lea; and it has been projected and acts of parliament obtained (A.D. 1812 and 1814) to make a navigable canal from Bishop Stortford along the valley of the Cam to the navigable part of that river below Cambridge, thus uniting the Thames and the Lea with the Cam and the Ouse. The tideway of the Crouch is navigable, and serves for the importation of groceries and fuel, and the exportation of agricultural produce. Near Burnham this river is a quarter of a mile wide (not three quarters of a mile, as Mr. Young states in his 'Agricultural Survey'), and has depth of water sufficient for a 98-gun ship: a 74 might go almost up to Hull bridge at the head of the tideway. The Blackwater does not appear to be navigable above the junction of the Chelmer. Vessels of considerable burden can get up to Maldon at spring tides. The Chelmer is navigable to Chelmsford. This navigation supplies Chelmsford and other places in the interior of the county with coal, deals, timber, and groceries, and serves for the exportation of agricultural produce. The navigation of the Colne, which extends to Colchester, answers the same purposes for that town and neighbourhood. The river Stour is navigable up to Sudbury, about 30 miles above Harwich. Essex has no navigable canals.

The principal roads in the county are the three roads from London to Norwich, by Ipswich, by Bury, and by Newmarket. The road by Ipswich enters the county at Bow bridge, about three miles from Whitechapel church, London, and crosses the county in nearly its greatest extent from south-west to north-east, passing through the market towns of Romford (12 miles from London), Chelmsford (29 miles), Witham (38 miles), and Colchester (51 miles), 7½ miles beyond which the road crosses the Stour at Stratford bridge and enters Suffolk. The road through Bury branches off from the Ipswich road at Chelmsford, and passes through the towns of Braintree (40½ miles from London) and Halsted (46½ miles), 8 miles beyond which the road crosses the Stour into the town of Sudbury in Suffolk. A branch from this road passes through the villages of Sible Hedingham, and Castle Hedingham, instead of through Halsted, and reunites with the main road about 2 miles before it quits the county: this branch is rather longer than the principal line. The road by Newmarket branches off from the Ipswich road a little beyond Bow bridge, crosses part of Epping Forest, and runs through the town of Epping (17 miles from London), about 7 miles beyond which it crosses the Stort into Hertfordshire: between 29 and 30 miles from London it re-crosses the same river into Essex, runs northward near but not through Saffron Walden, and finally quits the county at the village of Great Chesterford, 45 miles from London. A road which quits London by Shoreditch church enters the county at Lea bridge, and falls into this road at Snaresbrook, about 7 miles from London.

From the road by Colchester and Ipswich several roads branch off to different places on or near the bank of the Thames, or on the south and east coasts, as to Billericay (23 miles from town); to Tilbury Fort (25 or 29 miles by different roads); Southend (42 miles); and Maldon (37¼ miles), from which place are roads to the villages of Bradwell (51 miles), Southminster (48 miles), and Burnham (48½ miles), in the marshes of the south-east coast. From Colchester there are roads to Harwich (71½ miles from London), at the north-east extremity of the county, and to Neyland, in Suffolk (57 miles), on the border of Essex. From the Colchester road, near Bow bridge, a road runs by Chipping Ongar (21 miles) to Dunmow (40¾ miles). From the Bury road, between Braintree and Halsted, there is a road by Sible Hedingham to Haverill, in Suffolk (59 miles), on the borders of Essex. The towns in the northern part of the county are connected by a road which runs from Bishop Stortford, in Herts, on the border of Essex, through Dunmow, Braintree, and Coggeshall to Colchester. A road from Saffron Walden runs through Thaxted and Dunmow to Chelmsford; and short branches from the Colchester and Harwich roads lead respectively to Coggeshall and Manningtree.

Geological Character.—A considerable tract in the northern part of the county, stretching along the river Stour from the village of Keddington to between Sudbury and Neyland, and extending into the interior of the county, bounded by a line drawn from Keddington to the village of Hempstead, six miles east of Saffron Walden, from thence to Thaxted and the village of Great Easton on the road from Thaxted to Dunmow, and from thence by the neighbourhood of Halsted (a mile or two north of that town) to the Stour, is occupied by diluvial beds, consisting of loam with fragments of chalk. The coast of the north-east part of the county is covered with the sand or gravel of the upper marine formation, which occupies a considerable part of the counties of Norfolk and Suffolk, and is locally designated 'crag.' At the headland of the Naze it constitutes about 30 feet of the upper part of the cliffs (which are about 45 feet high) resting upon the London clay: south of the Naze its thickness appears to vary from 10 to 40 feet. In the projecting cliff of Harwich it includes friable masses of ferruginous sand, somewhat cemented together, and inclosing shells. The shells of this formation are in excellent preservation, commonly in a confused mixture, but at other times in patches of particular genera, and for the most part they do not appear to differ specifically from those of the neighbouring seas. Fragments of fossil bones washed out of the strata of this formation, in which they had been imbedded, are found on the beach at Walton, but occur in much greater quantities at Harwich. It is not known to what animal these belong, but a large fossil tooth, probably of the mammoth, was found, within the last few years, on the beach at Harwich. (Phillips and Conybeare, *Outlines of the Geology of England and Wales*.) In Mr. Greenough's Geological Map of England and Wales the cliffs south of the Naze are said to consist of loam, which contains the bones of the elephant, deer, horse, pig, aurochs or wild bull, and hippopotamus; and the strata along the south bank of the æstuary of the Stour are said to contain elephants' teeth.

The greater part of the county, including Epping and Hainault or Henhault Forests, is occupied by the London clay. This formation extends on the south and east to the banks of the Thames, to the coast, and to the tract occupied by the Crag: it is bounded on the inland side by a line drawn from the banks of the Stour about Boxted near Neyland to the junction of the Stort with the Lea. These may at least be taken as its approximate limits, for some of the beds of the plastic clay formation, which immediately underlies the London clay, are so similar to it, that it is difficult to trace exactly the line of demarcation. The London clay of the cliffs near Harwich contains beds of stratified limestone: the same cliffs are very productive in the fossils with which this formation abounds. South of Walton, near the Naze, abundance of septaria are found, which are sent by sea to Harwich, where they are manufactured by government into a cement. The principal elevations in the county, High Beach, Langdon and Danbury Hills, and Tiptrey Heath, are formed of London clay. The

surface of the vegetable mould does not commonly rest immediately on the London clay, but on alluvial beds of rich marl and loam, which often alternate with gravel and sand, and sometimes have a thickness of 30 or 40 feet.

The sands and clays of the plastic clay formation skirt the district of the London clay on the north-west. Halsted and Coggeshall, with the intermediate tract, are both on the plastic clay. The border of Essex, near Hadleigh, is the most northerly point at which this formation has been found.

The north-western extremity of the county, about Saffron Walden, consists of chalk: the great chalk district, in its extension from south-west to north-east, just crosses that part of the county. The chalk appears also at Purfleet and Gray's Thurrock, on the banks of the Thames. At the former place is an extensive chalk-pit belonging to Mr. Whitbread. Gun-flints are made at or near Purfleet. A subterranean forest underlies the marshes on the banks of the Thames.

Agriculture. The climate of Essex is favourable to vegetation: the sea and the numerous æstuaries which bound it on the south and east soften the rigour of winter, and keep up a certain degree of moisture in summer. The same cause, however, produces cold fogs and exhalations in spring and autumn, which are very prejudicial to the health of those who are not inured to the climate. In consequence of this the most fertile portions of the county, which lie along the Thames and the sea coast, towards the Colne river, and which are usually called the hundreds of Essex, contain few seats of men of fortune; and notwithstanding the richness of the soil, and the great advantage of the marshes for feeding cattle, few men from other counties venture to take farms in this part of Essex. This reproach to the climate of the hundreds of Essex is rapidly diminishing, since the marshes have been better drained and the woods, which prevented the free circulation of the air, and the dispersion of the fogs, have been gradually cut down, and the land brought into cultivation. The soil all along the coast, and 10 or 12 miles inland, is of a very excellent quality, being a friable loam of greater or less tenacity in different parts, but peculiarly adapted to the cultivation of wheat, beans, and oats. The Isle of Mersey, which lies at the mouth of the Colne river, has been long noted for the fertility of its soil, which is a fine alluvial loam composed of the various earths deposited from the river and the sea, like the warp lands along the Humber, or the polders in the Netherlands. The whole island is protected by a sea-wall, and produces every kind of grain which is usually cultivated; wheat, barley, oats, beans, and rape seed are the principal produce. Sir Humphry Davy found that the soil taken from Mersey Island and dried recovered its moisture from the atmosphere in less time than any other on which the experiment was tried; and this gives perhaps a better measure of fertility than any chemical analysis of its constituent parts. The best soils of Essex lie low, and require to be protected from the sea by embankments. Many marshes which formerly produced nothing but herbage, and were subject to inundations, are now converted into arable fields; and a great tract of land all along the coast, which used to be covered by the sea at high tides, is now laid dry by proper deep and broad ditches, here called fleets, and protected by high and well-constructed sea-walls, the repairs of which are a great expense to the proprietors. In some of these marshes the want of fresh water in summer was often felt severely. But lately recourse has been had to boring, which has been attended with great success, especially in the marshes at St. Osyth, where the finest springs of water have been found, which flow over the surface, and keep ample reservoirs continually full. The depth at which the water was found did not exceed fifty feet. This discovery greatly increases the value of these marshes in dry summers, such as that of 1836. The soil in the uplands along the coast consists chiefly of good loams varying in tenacity from a strong clay to a light gravel; most of it is of such a nature as to bear both turnips and beans. The stiffest soils, as well as the lightest, which form the two extremes, are more inland. The whole county has an undulating surface, which is very pleasing when fields and woods are interspersed, as is very generally the case in this county. The only level tract is that along the Thames, which extends to its mouth and along part of the south-eastern coast. The remainder consists of gentle elevations just sufficient to give a great variety of soil and aspect. The clay soils, on the whole, prevail in most parts of the county, and from this circumstance arises the modes of cultivation and the rotations of crops which are most commonly adopted. There are very few such light soils in Essex as there are in Norfolk and in Lincolnshire, and except on the borders of Hertfordshire and Cambridgeshire, chalk and marl are rare.

The cold wet clays have given rise to a mode of tillage which is minutely described by Arthur Young in his 'View of the Agriculture of this County, and held out as a pattern for the cultivation of cold wet clays. It consists of repeated ploughings in spring and summer, and exposure to frost in winter; two things, no doubt, highly beneficial to stiff land. But since the introduction of extensive under-draining and high manuring, much of the labour of the horses in ploughing and harrowing has been saved. The peculiarity of the Essex method, on stiff clays, was to work the fallows two winters for barley, during which period the land was ploughed in all directions eight or nine times, and even more, until it was sufficiently pulverized. The rotation was fallow; barley; fallow; wheat; beans: that is, two fallows in five years. The beans were frequently omitted: so that the land was alternately cropped and fallowed. No stock was kept on the farm, but a few cows for the use of the farmer, and the horses required to plough the ground: and the soil not being favourable for artificial grass, very little manure could be made except upon those farms which have marshes attached to them, which is not generally the case where the soil is the stiffest. There was consequently no sufficient manure for the land, and fallows were unavoidable to keep the soil in a moderate state of fertility. From sixteen to twenty bushels of wheat per acre, and from twenty-four to thirty of barley, was a common average produce on very good clays, which, with under-draining and proper manuring, now produce thirty-two of wheat and forty-eight of barley. The fallows at the same time are now removed to every fifth or sixth year.

The present mode of ploughing in Essex is similar to that of Norfolk and Suffolk; the ploughs most commonly in use are Suffolk wheel-ploughs, or swing ploughs without wheels. The great manufactory of these instruments is that of Messrs. Ransom, at Ipswich, which chiefly supplies the three eastern counties. In good loams, not too stiff, two horses are driven abreast with reins, whether the plough has wheels or not. In the very heavy wet clays three horses are used, who walk one before the other in the furrow. The object is that they may tread the land less; but some very judicious agriculturists maintain that three horses treading the bottom of the furrow render it quite impervious to water, and do more harm than if they had walked abreast over the land already ploughed, where they would only have trod in small cavities. This is rather a new mode of viewing the subject, but it is worth considering, and making trials to ascertain the real effect.

After harvest the stubble is generally ploughed in, and before winter the field is laid in narrow ridges which are formed by two turns of the plough, and sometimes by four turns, or two bouts, as they are called. The ploughmen are expert in this, and lay the ridges very regularly, sometimes diagonally across the field, which has a good effect in dividing the soil more completely. In this form a greater surface is exposed to the frost and air, and in spring it is mellow and crumbling, where in autumn it rose in an unbroken furrow. If a fallow is intended to clean the land, it is ploughed at intervals, and the roots of weeds gathered and burnt; if it is not very clear of these by wheat-sowing time, it is put in ridges again till the next spring, by which time it is quite pulverized, and fit to be manured for barley and clover. If wheat is sown in autumn, the manure is put on before the last ploughing.

The most common rotation on the stiffest clays which will not bear turnips is now 1, fallow; 2, wheat or barley; 3, clover; 4, oats or wheat; 5, beans; and where manure is abundant, a second crop of wheat is taken in the sixth year, before the course begins again. On the rich soils which bear turnips the usual rotation is turnips, barley, clover, wheat, beans, oats, or wheat. The manure is put on for the turnips and the beans: pease and tares are taken on part of the land, which otherwise would have had clover, and on that where the clover has failed. The mole plough has been used with good effect in many stiff soils, but the treading of the horses when the ground is soft, the only

time when the mole plough can be used with effect, does a great deal of harm on such land, so that this instrument is not so generally used as it might be. The method of draining introduced of late is so superior in its effects to the mole plough, that this instrument will soon be laid aside, except in old pastures, where it may sometimes save the expense of draining. The subsoil plough is not yet generally introduced, but will, no doubt, soon be found an admirable instrument. The feeding of oxen in winter is now extensively practised by all good farmers in Essex, whether of strong or light loams. In sandy and gravelly soils sheep may be more profitable; but where turnips, especially the Swedish, or mangel wurzel can be raised, on heavy soils, the only practical plan is to draw them and give them to the cattle in yards or stalls, together with straw and oil-cake. When the soil will not allow the carts to go over the fields where the turnips are without doing harm in winter, asses with panniers are used to bring the turnips to a cart on the hard road, or at once to the yard, if it is near at hand. Asses and boys may be employed in this manner with advantage in many situations, and the expense will not exceed that of horses and carts, although they bring but a small load at a time.

In those farms which have marshes attached to them a great number of cattle is constantly kept, and all the straw is converted into manure, by which the arable land is kept in a high state of fertility. Along the Thames the salt marshes are extensive, and are profitable from the number of horses which are sent to feed there from London, after they have been over worked and require rest, or when they have met with some accident. Where there is not a sufficient number of horses taken in to stock the marshes, oxen and sheep are bought to complete the number, but the profit on these is seldom equal to that on horses agisted.

Besides the common crops usually cultivated, a considerable quantity of cole or rape seed is raised on the richer alluvial soils of the hundreds. It is a profitable crop, owing to the abundant supply of manure brought from London by the Thames. In other situations it has been found to deteriorate the succeeding crops too much, and the cultivation has been abandoned. Flax is not cultivated anywhere in the county, at least to any extent, and very little hemp is sown. A few hops are raised in the western part of the county, towards Cambridgeshire. The cultivation of this plant is spreading rapidly, and every year some new hop gardens are formed. The extent of hop ground is however inconsiderable, when compared with that in the hop-growing counties of Kent, Surrey, Hertfordshire, &c. The cultivation of caraway, coriander, and teazles, which is peculiar to this county, is described under CARAWAY.

In that part of Essex which lies within a few miles of London the cultivation of the soil partakes more of the garden culture. Vegetables, especially cabbages, are raised in great quantities, and very extensive fields are almost entirely devoted to the raising of potatoes. The ground is ploughed, and very highly manured with stable dung from London. The potatoes are usually set by hand, and moulded up with the plough. They are taken up with the common three-pronged fork, and wheat is immediately sown after the principal crop is taken up. Those which are of an early kind, and taken up in June or July, are followed by cabbages. Mangel wurzel for the London cowmen are also raised in considerable quantities. The meadows within fifteen miles of London regularly supply the Whitechapel market with hay, and every cart brings back a load of dung.

The cows and horses in Essex are chiefly reared in Suffolk, and Scotland supplies the oxen to fatten. There are a few considerable dairies about Epsom; but in general the number of cows kept on a farm is not considerable. Many calves are fatted, which are killed in the country, or go to Romford to be sold to London butchers.

Sheep are now kept in greater flocks by the Essex farmers than they used to be, and with considerable advantage. By means of draining, the land has been made capable of being folded over even in winter. It is not a sheep-breeding county, although many fine lambs are reared; but they are generally bought from the breeders in Wiltshire or Sussex in autumn, and sold fat to the butcher in the succeeding spring. The South-down breed is preferred in general; but there are also many improved Leicesters, and lately the Norfolk sheep have come into favour with some farmers, who think them hardy and profitable, and whose fences are in such a state as to repress their rambling propensities. There is no peculiar breed of horses. The Suffolk punches seem to be in general use for farm work, and it is scarcely possible to find a breed better adapted for every kind of work. When crossed with a half bred horse of some substance and action, a Suffolk mare produces admirable carriage horses. In the marshes a good many horses are bred of various kinds, chiefly for draught. Essex has been long noted for a superior breed of pigs, which has been produced and improved by crosses with foreign breeds, chiefly the Neapolitan, which has very little hair, and the Chinese. The common Essex pigs have long ears standing upright, and thin in their texture. The best breeds are quite black, and have *wattles*, which are small appendages of skin like a long teat, hanging from the neck under the jaws. The most common Essex pigs, which are brought in great quantities to Smithfield market, are black and white, the head and rump being generally black, and the back and belly white. They fatten early, and make excellent small pork when fed on the refuse of the dairy. Lord Western's breed is in great repute, not only in Essex, but all over England.

The principal fairs in Essex are:—Billericay, August 2; October 7. Bishop Stortford, Holy Thursday; Trinity Thursday; October 10. Barking, October 22. Braintree, May 8; October 2 and 3. Chelmsford, May 12; October 12. Coggeshall, Whit Tuesday and Wednesday. Colchester, July 5, 23; October 20. Dunmow, May 6; November 8. Epping, Whit Tuesday; November 13. Grays, May 23; October 20. Halsted, May 6; October 29. Harlow, May 13; September 9; November 28. Lachinden, near Maldon, August 27. Maldon, May 1, 2; September 13, 14. Romford, June 24. Saffron Walden, day before Mid-lent Sunday; November 1. Stansted, May 12. Stebbing, July 9. Thaxted, Monday before Whit Monday. Waltham Abbey, May 14; September 25.

Divisions, Towns, &c.—Essex is divided into twenty parts, of which fourteen are called hundreds, five half hundreds, and one royal liberty. We subjoin a table of these divisions, with their situation, their respective areas, and population in 1831. We have distinguished by the letters (*h*) and (*l*) the half hundreds and the liberty.

	Acres.	Inhabitants.

There is no city in Essex. There are nineteen market-towns: three of these are parliamentary boroughs: Colchester, on the Colne, population of the borough and liberty in 1831, 16,167; Harwich, at the mouth of the Stour, population in 1831, 4297; and Maldon, on the Pant or Blackwater, population in 1831, 3831. Chelmsford, the county town, is on the Chelmer; population in 1831, 5435. Of these places, as well as of Barking, a market town on the Roding (population of the town ward in 1831, 3404; of the whole parish, which includes Ilford, 8036), an account is

given under their respective names. Of the other towns we subjoin an account.

Billericay is in the hundred of Barstable: it appears in one antient record, under the name Beleuca, which is probably a variation of the old word Baleuga or Banleuga (in French Banlieu), the territory or precinct round a manor or borough. The town stands on an eminence on the road leading from London, through Brentwood, to Rochford and Southend. In Camden's time the market was considerable, but for a long time past it has been much decayed. The town has been much improved of late years by a number of good houses, and from its situation commands a beautiful prospect over the valley which extends southward to the Thames. It is in the parish of Great Burghsted or Bursted, the church of which is about a mile and a half or two miles south of the town. There is a chapel in Billericay, supposed to have been founded in the fourteenth century: the tower, which is surmounted by a leaden spire, may be of that date, but the body of the chapel is of more modern origin. There are places of worship for Baptists, Independents, and Quakers.

The inhabitants of the parish of Great Bursted, in 1831, were 1977, of which about two-fifths were engaged in agriculture. There is a weekly market on Tuesday. There are scarcely any manufactures. The living is a vicarage, with the chapel of Billericay annexed. By the Education Returns of 1833, there were in the parish twelve day and five boarding-schools with 260 children, and two Sunday-schools with 171 children. One of the day-schools, with 49 scholars, has a small endowment. There is a parish alms-house for poor women.

At Blunts-walls, near Billericay, are some earth works, the remains of a ditch and rampart, enclosing an area of about four acres: within the area were some artificial mounds, now chiefly levelled. Some remains of Roman pottery, several Roman copper coins and two silver coins, one of Trajan and one of Adrian, have been found in the neighbourhood.

Braintree is in the hundred of Hinckford, and on the north bank of Pod's Brook; it is on the high road from London to Norwich, through Bury, 40½ miles from London and 11½ from Chelmsford, the county town. Antiently the manor of Braintree, or, as it is termed in Domesday, Raines, comprehended the neighbouring parish of Rayne as well as that of Braintree: part of the lands in it belonged to the bishops of London; it was alienated by Bishop Ridley at the time of the Reformation: the manor house (long since destroyed) was an episcopal palace. The parish was dismembered from that of Rayne, of which it was previously a hamlet, about the time of John or Henry III., the former of whom constituted it a market-town. The growth of the place is to be ascribed to its situation on one of the high roads from London into Norfolk and Suffolk, and to the building of inns and lodging-houses for the reception of the numerous pilgrims to the shrines of St. Edmund at Bury, and our lady of Walsingham in Norfolk. At the Reformation this source of its prosperity failed; but the town, and the adjacent village of Bocking, obtained consequence by the settlement of the Flemings who fled from the tyranny of the duke of Alba and established here the manufacture of baize and other light woollens, which for some time constituted the staple manufacture of the place, and is still carried on, though not to so great an extent as formerly.

It will be desirable to consider, in connection with Braintree, the adjacent village of Bocking; for although Bocking Church and Church Street are a mile and a half from Braintree, and on the north-east bank of the Pant or Blackwater, what is termed Bocking Street is contiguous to Braintree, and the two form one continuous place, the main street of which covers two-thirds of the extent between Pod's Brook and the river Pant, and stretches about a mile. Braintree consists of this street and of some others, formed by the intersection of the road from Bishop's Stortford and Dunmow to Coggeshall and Colchester, with the Norwich road, and by the convergence at this point of bye-roads from the surrounding villages: there are some back streets or lanes. The streets are inconveniently narrow; and many of the houses are of wood, and of considerable antiquity. The church is on the right at the entrance of the town from London; it is large, built chiefly of flint, and mostly in the perpendicular style of English architecture: the tower, at the west end, is of early English, and is surmounted by a lofty shingled spire of much later date. This church was enlarged in the time of Henry VIII., the expense of the alteration being partly defrayed by the profits of three mysteries or plays performed in the church. There are places of worship for Independents, Baptists, Quakers, and Methodists. Bocking Church is remote from the town: it is spacious and handsome, and chiefly in the perpendicular style; the tower is lofty and well designed. In the neighbourhood of Braintree are the remains of an antient church, formerly the parish church. Some coins, sepulchral urns, and other Roman antiquities, have been found.

The parliamentary returns for 1831 assign to the parish of Braintree an area of 2500 acres, 708 inhabited houses, and a population of 3422, about one-sixth agricultural: to that of Bocking an area of 3800 acres, 647 inhabited houses, and a population of 3128, about one-fourth agricultural, giving an aggregate of 6300 acres, 1355 houses, and 6550 inhabitants. The woollen manufacture has been in a great degree superseded by that of silk and crape, which is carried on to a considerable extent. The market is on Wednesday for corn, eggs, poultry, and occasionally cattle and live-stock of all kinds. There are several fulling and corn mills on the Pant.

The living of Braintree is a vicarage, of the yearly value of 212*l.*, with a globe-house, in the archdeaconry of Middlesex: that of Bocking is a rectory, of the yearly value of 923*l.*, with a glebe-house, in the peculiar jurisdiction of the archbishop of Canterbury, being subject only to his jurisdiction, or that of his commissary, who is called Dean of Bocking.

There is at Bocking an almshouse or hospital, originally for seven poor people, but now divided into nine tenements, with an endowment from the benefactions of several individuals. The returns made to parliament show that there were in the two parishes in 1833 twelve day or boarding and day-schools (two of them with 255 to 275 scholars, endowed, and three others with 340 scholars, supported by subscription), containing 813 to 833 scholars; one dame or infant school, with 60 or 70 scholars: and four Sunday-schools with 540 scholars.

Coggeshall is in Lexden hundred, on the northern bank of the river Blackwater, 44 miles from London by Chelmsford, Witham, and Kelvedon, where the Coggeshall road turns off from the Ipswich and Norwich road. It is sometimes called Great Coggeshall, to distinguish it from the adjacent hamlet of Little Coggeshall. This town has by some antiquaries been considered to be the Canonium of Antoninus; and several Roman remains have been found in and about the town, but these are not deemed by others sufficient to prove anything more than that a Romish villa existed here. Morant, the historian of Essex, ascribes the origin of Coggeshall to an abbey, founded here in 1142 by King Stephen and Maud, his queen, for Cistertian monks. To this abbey succeeding princes granted various privileges, among which was that of holding a market weekly. The yearly revenue of the abbey at the dissolution was 298*l.* 8*s.* gross, or 251*l.* 2*s.* clear. The town was formerly much engaged in the clothing trade, and was particularly famous for a white baize of superior fabric, called Coggeshall Whites. The clothing trade has much declined for many years past.

The town is irregularly laid out, and the streets are narrow and ill paved. The church, at the north-eastern end of the town, is a spacious and handsome building in the Perpendicular style of English architecture: the windows, especially the east window, are large and handsome; there is a large square tower at the west end. A small part of the abbey is yet remaining; and near it is a bridge of three arches, originally built by King Stephen over a cut made to convey the water of the river nearer to the abbey. The abbey has some good plain lancet windows, and the interior has some good groining and windows, with shafts; it is occupied as a farm-house. At Little Coggeshall, a hamlet of the town, half a mile south of it, said to have been once a distinct parish, were formerly two churches, one of them built by the monks of the abbey for their own use, the other the parish church: the former has been long demolished; the latter, or what remains of it, is now used as a barn. There are meeting-houses for Independents, Baptists, Quakers, and Methodists.

By the returns of 1831, the parish comprehended an area of 2770 acres, and had 624 inhabited houses, with a population of 3227, about two-sevenths agricultural. The

silk manufacture has been introduced here, and constitutes the principal manufacture of the place; that of woollens has declined. Some of the inhabitants are engaged in toy making. The market is on Saturday for corn, butter, eggs, and poultry, and occasionally live stock.

The living is a vicarage, of the yearly value of 215*l.* with a glebe house, in the archdeaconry of Colchester.

There are three unendowed almshouses near the church, and there is an endowed school. The parliamentary returns for 1833 assign to Coggeshall eleven day, or boarding and day, or evening schools, one endowed and one Lancasterian, with 294 scholars; thirteen dame or infant schools with 189 scholars; and six Sunday-schools with 490 scholars.

Dunmow, or Great Dunmow, is in Dunmow hundred, on the south-west bank of the river Chelmer, 38 miles from London by Epping, Harlow, and Hatfield Broad Oak: 40½ by Chigwell, Abridge, and Ongar; and 42 by Chelmsford, Great Waltham, and Barnston. Great Dunmow is considered by some antiquaries to have been the Roman station Cæsaromagus, which others fix near Widford, two miles south-west of Chelmsford. A number of Roman coins, of different emperors, have been found here. It is on a Roman road, crossing the county from west to east from Hertford to Colchester.

Dunmow is pleasantly situated on an eminence, and consists principally of two streets The market-cross in the centre of the town was erected in 1578, and repaired in 1761. The church stands a considerable distance from the main portion of the town: the houses adjacent to it form a group called Church End. It is a spacious building, with an embattled tower at the west end; it has some portions in the Decorated English, and some in the Perpendicular style: the east window, which is very fine, is of Decorated character. There are meeting-houses for Independents, Baptists, and Quakers.

The area of the parish is 7910 acres; there were in 1831, 499 inhabited houses, and 2462 inhabitants: nearly one-half of the population is agricultural. The manufacture of baize and blankets, formerly carried on, has been given up; some sacking and coarse cloth are made. The market, which according to one of our latest authorities has been discontinued, was on Saturday.

The living is a vicarage of the yearly value of 421*l.*, with a glebe house, in the archdeaconry of Middlesex. There is an almshouse for six poor persons.

About two miles east of Great D mow is the village of Little Dunmow (population in 1 378), where was a priory of Augustine canons, founded in 1104 by the Lady Juga, sister of Ralph Baynard, the then lord of the manor. Its yearly value at the dissolution was 173*l.* 2*s.* 4*d.* gross, or 150*l.* 3*s.* 4*d.* clear The monastic buildings are now razed, and the site partly occupied by the manor house. The priory church was a large and stately fabric, partly in the decorated English, partly in an earlier style of architecture: the roof was sustained by pillars, having capitals ornamented with oak leaves elegantly carved. Some of these remain in the part now used as the parish church. The well-known custom of the 'flitch of bacon' was connected with the manor of Little Dunmow. [DUNMOW BACON.]

Easton Lodge, the seat of Viscount Maynard, is situated on high ground in a spacious park about two miles northwest from Great Dunmow. It is a venerable pile of the Elizabethan period and style. In the returns of schools made to parliament for 1833, no account is given of those at Great Dunmow, except that there was a national school for girls, containing 103 scholars; and that a national school for boys, suspended from various causes at Christmas, 1832, had at the time of the suspension an average attendance of 75.

Epping is in the half hundred of Waltham, and on the high road from London to Norwich by Newmarket, 17 miles from London. The principal part of the town, called Epping Street, consists of a street extending more than half a mile in length, lined with irregularly built houses, and having in the centre a row of decayed mean-looking shambles. The church is situated two miles northwest of the street, and with the houses grouped round it constitutes what is distinguished as Epping Upland. The church is pleasantly situated on a rising ground: it is dedicated to All Saints, and is not distinguished by its architecture. In the 'Street' is a chapel of ease originally belonging to the abbot and monks of Waltham, to whom the great tithes had been granted, and who kept the parish in their own hands as a curacy. The chapel is now vested in trustees for the benefit of the inhabitants. It stands at the London entrance to the town, and has lately been rebuilt. There are places of worship in Epping for Quakers and Independents; but that for the Quakers, though close to the town and virtually belonging to it, is in an adjacent parish. There are many inns in the place.

The parliamentary returns for 1831 assign to Epping an area of 5250 acres, 429 inhabited houses, and 2313 inhabitants, of which 83 houses and 427 inhabitants are in Epping Upland and the hamlet of Ryhill, the last in Harlow hundred. In Epping Upland four-fifths of the population is agricultural, in the whole parish about two-fifths. The neighbourhood of Epping is celebrated for butter, pork, and sausages, of which articles it furnishes a considerable supply to the metropolis. The market is on Friday. In the spring great numbers of suckling calves are brought to Epping market from Suffolk, and those parts of Essex where dairy farms are numerous.

The living of Epping is a vicarage 'in the peculiar jurisdiction of the Court of the Commissary of London, concurrently with the Consistorial Episcopal Court.' (Lewis's *Top Dictionary.*) Its yearly value is 729*l.*, with a glebe house: the chapelry is of the yearly value of 120*l.*, arising from endowments.

The returns made to parliament in 1833 assign to the parish of Epping four infant or dame schools, with 50 children, eight boarding or day schools (one of them a charity school), with 343 scholars, and one Sunday school, with 70 boys. About 70 girls from this parish attend the national school of Theydon Garnon or Theydon Gernon (two miles south-east of Epping Street), to which the parishioners of Epping contribute largely.

In the parish of Epping is Copped Hall, a mansion erected near the site of an older structure raised by the monks of Waltham Abbey when they had possession of the manor; it was built near a century ago, and has since been much improved. It is one of the finest seats in the county. Near it are the remains of an antient camp, probably British, now overgrown with trees, called Ambreys, or Ambersbury banks.

Epping gives title to Epping Forest, a considerable tract of waste land in the south west part of the county. This forest was formerly called the forest of Essex, being the only forest in that county, the whole of which was antiently comprehended in it. By a charter of king John, dated 25th of March, in the fifth year of his reign, and confirmed in the eighth of Edward IV., all that part of the forest which lay to the north of the highway from Storiford to Colchester (very distant from the present boundaries) was disafforested. The forest was further reduced by a perambulation made in the twenty-ninth of Edward I., in pursuance of the Charta de Foresta: but the metes and bounds of it were finally determined by an inquisition and perambulation taken on the 8th of September, 1640, by virtue of a commission under the great seal of England, in pursuance of an act of the 16th of Charles I., for settling the bounds of the forests. The boundaries as thus settled include the whole of the eleven parishes of Wansted, Leyton, Walthamstow, Woodford, Loughton, Chigwell, Lambourne, Stapleford Abbotts, Waltham Holy Cross, Epping, and Nazing, and parts of the ten parishes of Chingford, Stratford, East Ham, West Ham, Little Ilford, Great Ilford, Barking, Dagenham, Haverstock, and Theydon Bois. The extent of the forest is estimated at 60,000 acres, of which 48,000 acres are estimated to be enclosed and private property: the remaining 12,000 acres are the unenclosed wastes and woods. What is called Henhault, or Hainault forest, is a part of this waste. (*Fifteenth Report of the Commissioners of Land Revenue*, quoted in Young's *Agriculture of Essex.*) Tendring hundred had been disafforested by king Stephen before the grant of John mentioned above. (Morant's *History of Essex.*) Epping forest is much resorted to by Londoners in what are termed 'gipsy parties;' and on the first Friday in July a kind of fair is held round the spot once occupied by an enormous oak called Fairlop oak. The fair retains the title of Fairlop Fair. On Easter Monday there is a stag-hunt much patronized by the inhabitants of London. The kennel for the hounds and the building belonging to the hunt were rebuilt several years ago at an expense of many thousand pounds.

Grays Thurrock is in the hundred of Chafford; it is on the bank of the Thames, 24 miles from London, through

Romford, Upminster, and Stifford. This little town consists chiefly of one irregular street on a creek of the Thames, accessible to hoys and other small vessels. The church, near the north end of the town, is built in the form of a cross, with a tower on the north side.

The area of the parish is 1570 acres; the number of inhabited houses by the census of 1831 was 243, the population (including that of the liberty of Lee, in East Tilbury parish, Barstable hundred), 1248. The population had greatly increased before the census, owing to the number of labourers employed in brick-making. The market is on Thursday, and is chiefly for the sale of corn; it is much frequented: there is one yearly fair.

The living is a vicarage of the yearly value of 160*l.*, with a glebe-house: it is in the archdeaconry of Essex.

There were in 1833 eight day-schools, with 138 scholars, 20 of whom (boys) were educated from the proceeds of an endowment; and two Sunday-schools, with 202 children.

There are two villages near this town which also bear the name of Thurrock: Little Thurrock, to the east of the town (population 302), and West Thurrock, to the west of the town (population 804). The chalk-quarries of Purfleet are in the parish of West Thurrock. In Little Thurrock parish, and in Chadwell parish, which adjoins it, are some remarkable caverns or holes in the chalk, to which tradition has assigned the name of 'Cunobelin's gold-mines.' It has been conjectured that they were granaries of the antient Britons. They are also called 'Dane holes,' from having been used by those invaders as lurking-places or receptacles for plunder.

Halsted is in Hinckford hundred, on the north-east bank of the river Colne, and on the road from London by Bury to Norwich, 46½ miles from London, and 17½ from Chelmsford. It is supposed that a market was established here in the Saxon times: a hill at the upper end of the town, on which for several centuries it was held, retains the name of Cheping hill.

The town stands on the slope of a gravelly eminence, rising from the river, and consists of the main street along the Norwich road, and some other streets. The church is near the centre of the town. It is a large edifice, capable of accommodating 1200 persons, and consisting of a nave, chancel, and side-aisles, chiefly in the Perpendicular English style: the chancel is in the Decorated style, with a good window of five lights, and others of two lights. There is a tower at the west end surmounted by a wooden spire, the third that has been erected on the same tower, two previous ones having been destroyed by lightning. There are places of worship for Independents, Baptists, and Quakers. There is a house of correction at Halsted.

The parish comprehends an area of 6230 acres; and had, in 1831, 989 inhabited houses, and 4637 inhabitants: about three-eighths of the population was agricultural. The silk manufacture is carried on to a considerable extent: the manufacture of baize and other light woollens has been discontinued. There is a market on Friday, one of the principal in the county for corn and occasionally for cattle and other live stock. Some hops are grown round the town.

The living is a vicarage, of the yearly value of 390*l.*, with a glebe-house, in the gift of the bishop of London: the minor canons of St. Paul's are the impropriators. There was a college of priests at Halsted before the Reformation; the foundation was for eight, but it is doubtful there was ever the full number. The revenue at the dissolution was 26*l.* 5*s.* 8*d.* per annum gross, or 23*l.* 16*s.* 5*d.* clear.

There were in Halsted, according to the returns made to parliament for 1833, ten infant or dame schools, with 150 scholars; four day-schools, one supported by voluntary contributions, containing 40 children, and three others with 100 children; and four Sunday-schools, with 695 scholars. There is a grammar-school, founded by Dame Mary Ramsey, for 40 poor children of Halsted and Colne Engaine (a neighbouring parish), which is not distinctly mentioned in the return.

'At a house in this parish is a Greek inscription, brought from a village near Smyrna, where it was erected one hundred and fifty years before Christ, to the honour of Crato, a musician.' (*Beauties of England and Wales*, 1803.)

Near Halsted are the remains of the antient manor-house of Stansted Hall.

Manningtree is in the hundred of Tendring, on the æstuary of the Stour, 60 miles from London, through Chelmsford and Colchester. This place was antiently known by the name of Sciddinchou; the origin of its present appellation, formerly written Many-Tree, is not known. It is a small place, irregularly laid out. The church or chapel, built out of the ruins of a more antient one, which stood on a site not far removed from that of the present building, was formerly very small, but has been lately enlarged. There are meeting-houses for Independents, Quakers, and Methodists.

The parish, or rather the chapelry, by the return of 1831, comprehended only 30 acres, and had 241 inhabited houses, and a population of 1237, a very small proportion of which was agricultural. Manningtree appears to be the residence of an unusual proportion of genteel families. A considerable trade in malt is carried on; and corn, coal, deals, iron, and fish are imported. The market is on Thursday.

The living is a perpetual curacy, united with the rectory of Mistley (of which parish the chapelry of Manningtree is a dependency) and the vicarage of Bradfield. The whole are of the yearly value of 698*l.*, with a glebe-house. They are in the archdeaconry of Colchester.

The chapelry contained, in 1833, one national school, containing 223 children; and one Sunday-school, with 60 children.

Mistley is adjacent to Harwich. Mistley Hall, the seat of the Rigby family, is on a pleasant eminence in the midst of gardens and plantations elegantly laid out. On the bank of the Stour is a quay with warehouses, at which considerable trade in corn, malt, and coal is carried on. These belong to the proprietor of the mansion.

Ongar, distinguished as Chipping Ongar from another parish of the same name (High Ongar), is in Ongar hundred, near the right or west bank of the Roding, and the left or east bank of the Cripsey brook, just above the junction of these two streams: it is 21 miles from London by Woodford bridge, Chigwell, and Abridge; or 24 miles by Epping.

A castle was built here by Richard de Lucy, one of the principal nobles of the time of Henry II.: the keep stood on the summit of a lofty artificial mound. The castle having become very ruinous, was, in the time of Queen Elizabeth, pulled down, and a brick house was built by the then owner of the place on the site of the keep. This house was demolished in 1744, and a large summer-house, of castellated architecture, built in its room. The moat which surrounded the keep, and other earthworks of the castle, still remain. The sides of the mound are planted with trees and shrubs.

The town chiefly consists of one long and wide street, extending from the bridge over the Cripsey brook, up the slope and along the brow of a hill. The church, which is in a central situation, is a small neat structure: the windows are remarkably small, so as to resemble the loop-holes of a castle. The church contains a monument of Jane, one of the daughters of Oliver Cromwell. Many Roman bricks have been worked into the building, and the foundations of Roman buildings are said to have been dug up in the churchyard. The principal road from Londinium (London) to Camulodunum (Colchester) is supposed by some to have passed this way, though others make it pass near or through Romford and Chelmsford. The town is within the area of an antient entrenchment, which may still be traced on its different sides. It was antiently called Ongar ad Castrum, perhaps with reference to this entrenchment. There is an Independent meeting-house.

The area of the parish is 480 acres: the number of inhabited houses in 1831 was 134, and the population 798, of which a small proportion is agricultural. The market is on Saturday.

The living is a rectory in the archdeaconry of Essex, of the yearly value of 127*l.*, with a glebe-house.

There were in 1833 nine boarding or day-schools, with 140 scholars; and two Sunday-schools, containing 95 children. One of the day-schools is endowed.

High Ongar, which is on the other side of the Roding, is a much larger parish than Chipping Ongar, and had, in 1831, a population of 1205, chiefly agricultural.

Rochford is in Rochford hundred, on the Broomhill river, which is navigable to within about a mile of the town, 40 miles from London through Romford, Brentwood, and Billericay. The town consists principally of two streets running one into the other in the form of the letter T: the houses are ill built; the market-house, which is of timber, stands

near the centre of the town, and has on it the date 1707: it is not used as a market-house now. There are two bridges over the river, which close to the town is an inconsiderable brook. The church, which is a little removed from the town, is a good-sized building, consisting of nave, chancel, and side aisles, with a lofty brick tower at the west end. There is an Independent meeting-house. At the lower end of the town are a row of brick almshouses for six poor people, founded and endowed by Robert Rich, earl of Warwick, in the early part of the seventeenth century.

The parish comprehends an area of 1240 acres: it had, in 1831, 271 inhabited houses, and a population of 1526, of which more than a third was agricultural. The chief trade is in corn. The market is on Thursday.

The living is a rectory, in the archdeaconry of Essex, of the yearly value of 570*l.*, with a glebe-house.

There were in the parish, in 1833, a Lancasterian school, with 70 boys; a national school, with 64 children (rather more on Sunday); seven other day-schools, with 158 scholars; and one Sunday-school, with 100 children: to the Sunday-school a lending library is attached.

Romford is in the liberty of Havering atte Bower, on the Bourne brook: it is a great thoroughfare, being on the high road from London to Chelmsford, Colchester, Ipswich, Bury, Norwich, Yarmouth, and other large towns in Essex, Suffolk, and Norfolk; between 11 and 12 miles from London. The derivation of the name has been much disputed, some contending that it is derived from Roman ford, others from two Saxon words signifying 'broad ford.' This place, or some spot in the neighbourhood, is supposed to be the site of the Durolitum of the Itinerary of Antoninus.

The town consists almost entirely of one long wide street, near the centre of which is the market-house and town-hall, which was repaired in 1768 at the expense of the crown. The houses are tolerably good, and the street is paved and lighted. The chapel, situated at the entrance to the town from London, on the left hand, is a tolerably large building, erected in the early part of the fifteenth century: it is dedicated to the Virgin Mary and St. Edward the Confessor, and consists of a chancel, nave, and north aisle, with a square tower at the west end. In the east window is a figure of Edward the Confessor in stained glass, the arms of that king, and another coat of arms. The Independents have a meeting-house at Collier's Row, a hamlet of the parochial chapelry of Romford, about two miles north-west of the town; a house for the pastor and a small endowment are connected with it. There is also a Methodist meeting. An almshouse for five poor men was founded and well endowed by Roger Reed near the end of the fifteenth century. There were formerly cavalry barracks at the London entrance to the town: they were of wood, and have since been pulled down.

The parish comprehends an area of 3340 acres, and had, in 1831, 766 inhabited houses, and a population of 4294, of which less than one-third is agricultural. The general market is on Wednesday: there is a market on Monday for calves, and on Tuesday for hogs. In spring and summer great numbers of suckling calves are brought to market from Suffolk and the dairy districts of Essex.

This parish, with those of Hornchurch and Havering, form the liberty of Havering atte Bower, the quarter sessions for which are held at Romford. Commissions for trying felons within this liberty may be obtained by a small payment to the crown, but no commission has been applied for for many years. (Lysons' *Environs of London.*)

The living is a chapelry originally included in the parish of Hornchurch, the limits of which were once coextensive with those of Havering liberty, but separated from it by act of parliament, A.D. 1658. The living is of the annual value of 800*l.*, with a glebe-house, in the patronage of New College, at Oxford: it is in the archdeaconry of Essex. There were, before the Reformation, a chantry and a small guild attached to Romford chapel, the lands of which were valued at 4*l.* 10*s.* 2*d.* per annum.

There were, in 1833, in the parish, one endowed day-school with 121 scholars, six other day-schools with 172 scholars, and two Sunday-schools with 143 scholars.

Walden or Saffron Walden is in the hundred of Uttlesford, which occupies the north-western extremity of the county: it is near the Cam, and a little to the right of the road from London to Newmarket and Norwich, 42 miles from London. It was conjectured by Doctor Stukely, but without sufficient authority, that this was a Roman station. Its name is derived from two Saxon words, Wealb, a wood, and ben, a valley: its epithet 'Saffron' is derived from the great quantity of that plant formerly cultivated in the neighbourhood: this cultivation has been long abandoned. At the period of the Domesday survey the lordship of Walden was possessed by a Norman, Geoffrey de Magnaville, one of the companions of the Conqueror. This nobleman erected at Walden a castle, which, judging from the remains of it, must have been of great strength. The remains occupy the highest part of the town, and consist of some parts of the walls and towers, built with flint bound together by a very hard cement. Geoffrey, the grandson of the founder of the castle, having deserted the party of Stephen for that of the Empress Maud, obtained of her permission to remove the market from the neighbouring town of Newport (now a village) to Walden. Having been however seized by Stephen, he could only obtain his freedom by the delivery of his castles, Walden being one of them, to the king. The same nobleman founded here in 1136 a Benedictine priory, which was some years later raised to the rank of an abbey: this abbey obtained several valuable benefactions, and had, at the time of the dissolution, a yearly revenue of 406*l.* 15*s.* 11*d.* gross, or 372*l.* 18*s.* 1*d.* clear. The site was granted to Sir Thomas Audley, lord chancellor, and the title of Lord Audley of Walden was conferred upon him. On the site and grounds of the monastery, enlarged by a subsequent addition of 200 acres, stand the present mansion and park of Audley End.

The town is irregularly laid out, and the houses are many of them of considerable antiquity. The church is 'a large and very elegant specimen of the late Perpendicular style. It has a nave and aisles, large south porch, and chancel and aisles. The clerestory windows of the nave are very large and of six lights; those of the chancel, which has a lower roof, are much smaller, and two in each arch. The eastern end of the nave is finished by two octagonal turrets with crocketted ogee heads. The windows of the aisles are very large, filling up the spaces close to the buttresses, and they are mostly square-headed. The tower has bold buttresses, crowned with octagonal turrets, and very long plain pinnacles. These pinnacles and the spire, which is of wood covered with lead, appear to be of later date than the church. The interior of this church is very fine, the piers being remarkably light and elegant.' Rickman's *Essay on Gothic Architecture.* Since the above extracted account was written the wooden spire has been replaced by one of stone more in character with the rest of the building. There are two places of worship for Calvinistic or Particular Baptists, and one for Arminian or General Baptists, and one each for Independents, Quakers, and Wesleyan Methodists. The town-hall is a neat building in the market-place, which is spacious. There are a cattle-market and a handsome range of almshouses lately built in the place of a former range founded and endowed by Edward VI. for 16 decayed housekeepers of each sex. There is also a neat building lately erected near the ruins of the castle for a museum, and for the meetings of a literary society established in the town. Audley House, or as it is usually termed, Audley End, the seat of Lord Braybrooke, is a noble mansion erected by the Earl of Suffolk, who in the time of James I., had inherited the estate of the Lord Chancellor Audley. The grounds are beautiful, and the Cam, which flows through them, though here an inconsiderable stream, expands so as to form a considerable sheet of water in front of the house. The mansion, originally more extensive than at present, is still one of the finest in the county; it is said to have cost at its erection 190,000*l.* The house contains some interesting portraits and other pictures. On a green near the town is a singular remain of antiquity called the Maze. It consists of a series of concentric circles with four outworks cut in the chalk, which here rises to the surface. Its origin and use are unknown: Dr. Stukely conjectures that it was a British cursus or place of exercise for the soldiery. A short distance from the town are the remains of an antient encampment of an oblong form called Pell Ditches or Repel Ditches. The south bank is 730 feet long, 20 high, and 50 broad at the base, and 6 or 8 wide at the top: the west bank is 588 feet long: both banks and ditches are extremely bold and well preserved.

The parish of Saffron Walden contains 7380 acres, and had in 1831 941 inhabited houses and a population of 4762, of which about one-fourth was agricultural: there are

many genteel families in the town. The chief trade is in barley and malt: the market is on Saturday. Walden is a municipal though not a parliamentary borough. By the Municipal Reform Act the corporation consists of a mayor, four aldermen, and twelve councillors. The borough is co-extensive with the parish.

The living is a vicarage in the archdeaconry of Colchester, of the annual value of 237*l.*, with a glebe-house. Lord Braybrooke is patron and impropriator.

There were in Walden in 1833 one infant school with 70 children: two national schools, containing 124 boys and 106 girls (with the addition of 10 boys on Sundays); a school for 25 boys and as many girls, chiefly supported by Lord Braybrooke; and six other day-schools with 212 children; and two Sunday-schools with 289 children.

Waltham Abbey, or Holy Cross, is in the half-hundred of Waltham, 12½ miles from London, a little to the right of the road to Ware, Royston, and Huntingdon. It is on the river Lea (which is here separated into several channels, some of which flow through the town) near the junction of the Cobbin brook, which flows a short distance from the town on the east and south.

The first notice of Waltham occurs in the reign of Canute, whose standard-bearer, Tovi, founded here a religious house with two priests, probably secular canons of St. Augustine. The place derived sanctity and name (Holy Cross) from a cross with the figure of Christ upon it found at Montacute and transferred here, to which miraculous powers were ascribed. Harold, afterwards king of England, enlarged the foundation of Tovi, A.D. 1062, furnished it with ample endowments, increased the number of canons to 12, one of whom had the rank of dean, rebuilt the church, and established such a school of learning as the state of the age admitted. When the unfortunate Harold fell in the battle of Hastings, A.D. 1066, his body, which had been given up to his mother, was brought to Waltham for interment and his tomb erected. William the Conqueror treated the religious of Waltham harshly, and deprived them of their moveable valuables, but left their lands untouched or nearly so. In the reign of Henry II. (A.D. 1177) regular canons were substituted for seculars, the number enlarged to 16, the endowments of the establishment augmented, and the dignity of abbot conferred upon the head of it. Subsequent monarchs favoured the establishment: Henry III. frequently resided in the abbey, and granted to the inhabitants of the village the privilege of a market and a fair. Some accounts make the market more antient. In the reign of this king, A.D. 1242, the conventual church was again solemnly dedicated, the king and several of his nobles being present. The yearly revenues of the abbey at the dissolution were 1079*l.* 12*s.* 1*d.* gross, or 900*l.* 4*s.* 3*d.* clear.

The town consists principally of one main street, running nearly east and west. The church, formerly part of the conventual church, is on the north side of the main street, near the centre of the town. As the conventual church it was very extensive, consisting of nave, transept, choir, and chapels. At the intersection of the transept, which may still be traced, rose the great tower, which contained a ring of five bells. Part of this tower having fallen in, the remainder was blown up by underminers, and the whole choir, tower, transept, and east chapel demolished. The nave and some adjacent chapels alone remained: the nave, with its side-aisles, forms the body of the present church. The extent of the original fabric may be estimated by the fact, that Harold's tomb, which was in the choir or in a chapel beyond it, stood about 120 feet eastward from the termination of the present building. The church is about 90 feet in length, and in breadth, including the side-aisles, 48 feet: it is in the Norman style, with round massive piers (some of which have indents of wave and zig-zag lines), dividing the nave from the side-aisles; semicircular arches, and zig-zag enrichments. The great arch of the cross, now walled up, is a very fine one. Above the arches dividing the nave from the side-aisles are two other ranges or tiers of arches: those of the second tier correspond in width to those of the lower, but are not of equal height; the arches of the third tier are three to each arch of the lower tiers, with a window pierced in the middle arch of the three. The roof is modern, and little ornamented. The side-aisles are surmounted with galleries, erected about half a century ago. At the west end of the church is a heavy square embattled stone tower, 86 feet high, bearing the date 1558. From the south side of the church projects the Lady Chapel, now used as a vestry and school-room, under which is a fine crypt. Another little chapel, at the south-east end of the church, is now a repository for rubbish. These chapels have some beautiful and well-executed portions in the Decorated English style. There are in the church various inserted windows of different dates. The font is apparently very antient, and there is a fine wooden screen. The building has been much injured and its beauty deformed by dilapidation and alterations, but it is still well worthy of attention.

Exclusive of the nave of the abbey church, the remains of the abbey are but few. They consist of an entrance-gateway, and bridge across an arm of the Lea, which bounds the enclosure of the abbey on the west side; some walls, and a few vaulted arches in a garden belonging to the abbey farm. The refectory is reported to have stood eastward of the church; and what is now the abbey farm is said to have been antiently the stables. The gateway is in a much later style of architecture than the church. In the gardens formerly belonging to the abbey, now occupied as a nursery-ground, is a tulip tree, reported to be the largest in England. There are at Waltham Abbey meeting-houses for Baptists and Wesleyan Methodists.

The parish of Waltham Abbey is extensive, comprehending 11,870 acres: it had, in 1831, 760 inhabited houses, and a population of 4104; but of these 344 houses and 1902 inhabitants were in the three hamlets of Holyfield, Sewardstone, and Upshire; leaving for that part of the parish which contains the town 416 houses and 2202 inhabitants: only a small proportion of the population of the town division is agricultural; but the greater part of the population of the hamlets is so. The powder-mills belonging to government employ many hands: many are engaged in the printing of silk handkerchiefs, and some in the manufacture of pins: some also, though not in the town division, are engaged in throwing and spinning silk. The market is on Tuesday.

The living is a donative curacy, in the peculiar jurisdiction of the bishop of London: it is of the annual value of 237*l.* There is an almshouse for eight poor widows.

There were in the year 1833 one infant school, with 135 children: three day-schools, viz., one endowed for 20 boys and 20 girls, one national school for 60 girls, and a school with 24 boys at High Beach, besides many small private day-schools; one evening-school, supported by voluntary contributions, with 42 boys; and four Sunday-schools, with 310 children.

Witham is in the hundred of Witham, and on the high road from London to Norwich by Ipswich, 38 miles from London. It is on Pod's Brook, just above the junction of that stream with the Blackwater.

This town is generally reputed to have been built by Edward the Elder, but it is questionable if that prince did more than restore a place that bears marks of having been a Roman station. On Cheping Hill or Chipping Hill are the remains of a circular camp, with a double vallum. A quantity of Roman bricks are worked up in the tower and body of the church, and one or two Roman coins were discovered in levelling the fortifications of the above-mentioned camp. From these indications it has been supposed that Witham was the Canonium of Antoninus, which is placed by others near Kelvedon.

The town consists of two portions: the larger portion consists of one main street along the high road and a short street or two branching from it: the other portion, in which is the church, is situated half a mile to the north of the principal part, on Cheping Hill, mentioned above. There is no kind of manufacture carried on; but the trade of the place arises from the wants of the neighbourhood, and its situation on a great public thoroughfare. Several genteel families reside in the town; and a mineral spring, Witham Spa, attracted some years since, and perhaps still attracts, visiters in the summer. The church is a tolerably large building, containing some antient monuments. There are places of worship for Independents, Baptists, Quakers, and Catholics; and several almshouses, but none very extensive or richly endowed.

The parish comprehends an area of 3280 acres; and had, in 1831, 552 inhabited houses, and a population of 2735, of which less than a fifth was agricultural. The market is on Tuesday.

The living is a vicarage, in the archdeaconry of Colchester, of the yearly value of 473*l.*, with a glebe-house, in the gift of the bishop of London.

There were, in 1833, fifteen day schools with 361 children; two boarding schools with 40 girls; and one Sunday school with 200 children, and a lending library attached. Of the day-schools, one (for 100 boys and 50 girls) is partly supported by an endowment; another (for 70 girls) partly by voluntary contributions.

Faulkbourn hall, not far from Witham, is an antient manor house, different parts of which have been erected at very different periods. A tower gateway of curious architecture is supposed to be as old as the time of Stephen.

Beside the above market-towns, there are several villages which are of sufficient importance to call for notice. The following were formerly market-towns, and some of them still retain their place as market-towns in many of our common maps:—Great Bardfield, Brentwood, Dedham, Harlow, Hatfield, Horndon, Ingatestone, Leigh, Thaxted, and Rayleigh.

Great Bardfield is in the half hundred of Freshwell or Freshwell, on the south bank of the Pant or Blackwater, over which it has a strong brick bridge. In the south aisle of the church are some coats of mail, &c., said to have belonged to the Lumley family. The population, in 1831, was 1029, about half of them agricultural. The market has been long given up.

Brentwood is on the road to Chelmsford and Colchester, 18 miles from London and 11 from Chelmsford. Some Roman antiquities have been found in the neighbourhood. The assizes for the county were formerly held here. The place consists chiefly of one main street along the high road, with irregular and mean houses: from its situation on a great thoroughfare, it has many public houses and inns. There are the remains of the old prison and town hall, the tenants of which are bound to put them in repair if ever the assizes should be held in the place again. There is an antient chapel in the town (for Brentwood is only a chapelry in the parish of South Weald, and the living a perpetual curacy, worth 124*l.* a year, with a glebe-house, in the archdeaconry of Essex), founded about the year 1227, by the prior of the monastery of St. Osyth, for the tenants of a manor belonging to that monastery: this chapel is a small building, dedicated to St. Thomas à Becket, of whom it contains a rude image carved in wood. There is an endowed school. Races are held in the neighbourhood; and at Warley, not far off, are cavalry barracks. The area of the chapelry is 730 acres: the population, in 1831, was 1642. The market has not been discontinued many years. There are two yearly fairs, at which a great number of cattle are usually sold: it is one of the fairs from which the farmers of 'the hundreds' obtain their live stock.

Dedham is in Lexden hundred, on the south bank of the river Stour, just on the right hand of the road to Ipswich and Norwich, about 58 miles from London. In the reign of Richard II. this place was famous as one of the seats of the clothing trade. It is situated in a picturesque valley, and is a small place, consisting chiefly of one street. The church is a large building in the Perpendicular style of English architecture: it has a fine tower at the west end with octagonal turrets crowned with rich pinnacles. There is a bridge over the Stour. The population of the parish, in 1831, was 1770, about half agricultural: many genteel families reside in the place. There is an endowed free grammar school for 40 boys; and an English school, partly endowed, with more than 60 scholars; and a number of private schools. The living is a vicarage worth 170*l.* per annum, with a glebe-house: the rectorial tithes form the foundation of a lectureship connected with the church. The Rev. W. Burkitt, author of a well known commentary on the New Testament, was lecturer here.

Harlow is in the half hundred of Harlow, just beside the road by Newmarket to Norwich, rather more than 23 miles from town. The village is about a mile from the river Stort. It was formerly the seat of a large woollen manufacture and of a considerable trade. The church is in a central situation, and is of tolerable size: it was originally in the form of a cross, with a central tower rising from the intersection of the transepts: this church was much injured by fire in 1711, and upon its restoration a cupola was substituted for the tower: the church is adorned with much painted glass. There is a place of worship for Baptists, several almshouses, and a charity school.

At Harlow Bury, a mile north of the village, is a large antient chapel, used as a barn or farm-office. It has a fine semicircular-headed door, the shafts of which have small capitals like those of the Galilee at Durham. There are some small windows with round heads and others with pointed heads.

The parish of Harlow contains 4490 acres, and had in 1831 a population of 2101, above half agricultural. There are three considerable fairs in the year for horses and cattle: the second, held on Harlowbush Common, two or three miles south of the village, is the most frequented: horses for all purposes, black cattle and other live stock, and wool, are brought for sale, and the fair attracts a concourse of people for fifteen or twenty miles round, and even from the metropolis. The living is a vicarage, of the yearly value of 383*l.*, with a glebe-house, in the archdeaconry of London.

A large sum of money (8000*l.*), bequeathed by Mr. Geo. Fawbert, has been vested in trustees for the establishment of a day school and library at Harlow, and for apprenticing or otherwise advancing in the world those educated at the school.

Hatfield is in the half hundred of Harlow, on the road from London by Harlow to Dunmow, 30 miles from town: it is on the Pincey brook, which flows into the Stort. This place was formerly part of the royal demesne, from which circumstance it obtained one of its distinguishing epithets, Hatfield Regis: its other designation of Hatfield Broad Oak it obtained from a large oak supposed to have flourished here in the Saxon times. A portion of this tree (if we may trust the accuracy of Mr. Arthur Young's statement) was yet remaining in Hatfield Forest, a mile or two north of the town, when that gentleman published his agricultural survey of Essex, in which an engraving of this venerable tree is given. Aubrey de Vere founded, A.D. 1135, a Benedictine priory at Hatfield supposed to have been at first a cell of the abbey of St. Melanius Redonensis, at Rennes or Rédon, in Bretagne, but subsequently rendered independent. The possessions of this priory at the suppression were estimated at the yearly value of 157*l.* 3*s.* 2*d.* gross, or 122*l.* 13*s.* 2*d.* clear. The parish, which is very large, had in 1831 a population of 1825, chiefly agricultural. The church has a western tower and a large porch in the Perpendicular style, and other parts are of a character betokening a more antient date. The Methodists have a place of worship. The living is a vicarage, worth 210*l.* a year, with a glebe house, in the archdeaconry of Middlesex.

Horndon, distinguished from two other parishes of the same name by the epithet 'on the hill,' is in Barstable hundred, and is situated, as its name imports, on an eminence, from whence there is a fine view. The church is in the middle of the town; it has a stone tower, embattled. The parish had in 1831 a population of 511, chiefly agricultural. The market, when Morant published his history of Essex (1768), was very small; it has been since given up. There is one fair in the year, chiefly for wool. It is 27½ miles from London through Brentwood.

Ingatestone is in the hundred of Chelmsford, and on the road from London to Chelmsford, 23 miles from London. It is supposed to have derived its name from a Roman military stone, and from the Saxon word Ing, a meadow; thus, Ing-atte stone. The village, which extends into the adjoining parish of Fryerning, consists of a long street along the high road, and a smaller street running out of this to the south-east. From its situation on so great a thoroughfare it abounds with inns. It had formerly a large cattle market, but this is now discontinued: there is a large cattle fair. The church is in the middle of the town, and contains several monuments of the Petre family. There is an almshouse and an Independent meeting-house. Ingatestone Hall, a little way south of the town, was once the seat of the Petre family: it is a very antient and irregular pile. The grounds are well stored with fish-ponds, and the whole was formerly surrounded by a park. The population of the parish, which is small, was in 1831 789, chiefly agricultural: to these we may add perhaps 300 for that part of the village which is in Fryerning parish. It may be observed that the syllable Ing (or Ging, which appears to be a variety of it), which enters into the name Ingatestone, is found in the names of several other parishes or manors in this neighbourhood, as Fryern-ing, Margarett-ing, Mountneys-ing, Ginges-joiberd (commonly called Buttsbury), Ingrave or Ging-ralph, and Trestl-ing or Thrust-ing: to which we may add Bark-ing.

Raleigh or Rayleigh is in Rochford hundred, 34 miles from London. It was, at the time of the Domesday survey, one of the numerous lordships of Suene, who, having joined the Conqueror at an early period, was allowed to retain his possessions. He built a castle here, of which some earthworks yet remain, consisting of a mound with an oval base, surrounded by a double ditch and embankments. The village stands on an eminence, and has, at the upper end, the church, an edifice principally in the Perpendicular style, with some portions of an earlier date: the tower has a short spire and a staircase turret battlemented. The Baptists have a place of worship here. When Morant wrote, a weekly market was held at Rayleigh: it is now given up. There is a cattle fair. The population of the parish in 1831 was 1339, chiefly agricultural. The living is a rectory of the yearly value of 774*l*., with a glebe-house, in the archdeaconry of Essex.

Thaxted is in the hundred of Dunmow, 44 miles from London by Harlow, Hatfield Broad Oak, and Dunmow. This is a very antient place, and probably existed in the time of the Saxons. It was incorporated by charter of Philip and Mary, and its government vested in a mayor, bailiffs, and chief burgesses; but the corporation became extinct in the time of James II., the corporate officers having retired from their offices on being served with a *Quo Warranto*. The town is irregularly laid out; its chief ornament is the church, which is in the centre of the town, and is one of the finest in the county It is mostly in the Perpendicular English style, and consists of a nave and chancel with side aisles, transept, and tower at the west end. The nave is not so wide as either of the side aisles, from which it is separated by eight clustered pillars on each side with pointed arches. The windows are mostly large, and many of them are ornamented with tracery and painted glass, but the latter is much broken and otherwise defaced. The north and south porches are richly ornamented with sculpture. The tower is sustained by buttresses, and is embattled, and terminated with a very rich crocketted spire, supported by flying buttresses. Most of the buttresses of the aisles have fine pinnacles, and are enriched with panneling. The height of the tower and spire is 183 feet, which is also the length of the church: the breadth of the church is 87 feet. It is supposed to have been built in the fourteenth century. There are at Thaxted meeting-houses for Quakers, Independents, and Baptists. There is a free grammar-school, which contained, in 1833, 30 boys on the foundation and 30 others whose education was paid for by their parents. Upon the same foundation 20 girls were educated at another school.

The population of Thaxted parish (which comprehends 6890 acres) was, in 1831, 2293, more than half agricultural. The living is a vicarage, in the archdeaconry of Middlesex, of the yearly value of 450*l*., with a glebe-house. The market, which had been long disused, was revived about the close of the last century, but was not much attended, and has since been again discontinued. There are two fairs in the year. There are several almshouses in the place, and the benefactions to the poor have been very considerable. Near Thaxted is the antient hall, Horeham-hall, the seat of Sir William Smith: it is a castellated gothic mansion partly covered with ivy.

Beside the above, which have been market towns, there are several other villages which, from their importance, call for notice.

Ashdon, the parish of which, including the hamlet of Bartlow End, had, in 1831, a population of 1103, is in the half hundred of Freshwell, three miles from Saffron Walden. It is supposed by some to have been the scene of a dreadful battle fought between Edmund Ironside and Canute; but the battle was more probably fought at Assingdon in the hundred of Rochford. At Bartlow hills, in the parish of Bartlow, Cambridgeshire, two miles north of Bartlow church, four contiguous barrows have been regarded as the tumuli raised over those who were slain in this battle, but this rests on tradition only.

Brightlingsey (population in 1831 1784) is on the æstuary of the Colne, in Tendring hundred. The inhabitants are engaged in the oyster fishery. The parish forms a peninsula, surrounded by the marshes of the Colne and its inlets, except on the north-east side, where is the only entrance to the parish, except by a ford. The church is near this entrance, the village is a mile distant nearer the sea. Morant speaks of an establishment for preparing copperas here, and the 'copperas house' is marked in the Ordnance Survey. Brightlingsey is a member of Sandwich in Kent, one of the Cinque Ports. The population has nearly doubled within the present century.

Burnham is in Dengie hundred, on the north bank of the æstuary of the Crouch, which has here a depth of water sufficient for a ninety-gun ship. It had a good street towards the river and a commodious quay. The church is nearly a mile from the village. The population, in 1831, was 1393: the inhabitants are engaged in the oyster fishery.

Chigwell lies between Epping and Henhault forests: from Chigwell Row, on the border of the latter, a most extensive view is obtained over the south of Essex and the Thames into Kent. There is an endowed grammar-school which, in 1833, had six scholars, and another endowed school with sixty boys. Population in 1831, 1815.

The Hams are in Becontree hundred, and in the immediate neighbourhood of London. West Ham parish occupies the south-west corner of the county, and is bounded by the Thames and the Lea, by which it is respectively separated from the counties of Kent and Middlesex. It is divided into four wards: All Saints, Church Street, Plaistow, and Stratford. West Ham had formerly a market, the charter for which was procured in the thirteenth century. There was formerly at Stratford Langthorn, in this parish, an abbey for Cistertian monks. The abbey having become dilapidated from the flooding of the marshes, amid which it was built, the monks were removed to Burgestede (now Burstead), near Billericay, until 'one of the Richards, kings of England,' (probably Richard II.) repaired the abbey and brought the monks into it again. In 1307 the abbot was summoned to parliament. At the dissolution the yearly revenues of this house were estimated at 573*l*. 15*s*. 6*d*. gross, or 511*l*. 16*s*. 3*d*. clear. The chief remains now existing of the conventual buildings are a brick gateway, the entrance to the precincts, and an ornamented arch in the Early English style, which appears to have been the entrance to the chapel: they are nearly half a mile south-west of the church. The site of the precincts was moated and contained about sixteen acres. West Ham church consists of a nave and chancel, and side aisles to both: it is large, but not distinguished for its architecture.

Stratford, which is one of the wards of this parish, lies along the road to Romford, Chelmsford, &c., and may be regarded as a prolongation of the suburbs of the metropolis, being joined to it by an almost continuous line of buildings, constituting the village of Bow, and the hamlet of Mile End in Middlesex. A new church has been lately erected here. The Newmarket road branches off from the Chelmsford and Colchester road at Stratford.

The population of West Ham parish was in 1831 11,580, of which less than one-sixth was agricultural. A considerable number of the inhabitants are labourers, employed in the East and West India docks at Poplar and Blackwall. Calico and silk dyeing and printing are extensively carried on: chemicals are manufactured, and porter is brewed. The West Ham water-works supply the eastern suburbs of the metropolis with water. Several of the wealthier inhabitants of London have residences at West Ham.

The living of West Ham is a vicarage, in the archdeaconry of Essex, and in the gift of the crown: its yearly value is 875*l*. There are several dissenting meeting-houses.

There were in this parish in 1833 two infant schools, partly supported by contributions, with 150 children; three endowed day-schools, with 257 children, some of whom were clothed; a national school, partly supported by endowment and subscription, with 50 boys; a school with 40 children, supported by contribution by Roman Catholics; another of 10 children, supported by Dissenters; and another school of 120 children, partly supported by contributions; and four Sunday-schools, with 390 children. There were also many private boarding and day schools, containing 488 children.

East Ham parish joins that of West Ham. The church consists of a nave with two chancels; the upper chancel, which forms the eastern extremity of the church, is semicircular at the east end, and has narrow pointed windows. Part of the walls of the nave and lower chancel are in the Norman style, as is the lower part of the tower; but the

windows of the nave are of later date, and some of them modern. In the church is a monument of Edmund Nevill, Lord Latimer. Dr. Stukely, the antiquary, is buried in the churchyard, but, at his own desire, without any monument. At Green Street, a hamlet of this parish, is an antient mansion, supposed to have been the residence of the Nevill family. The population of East Ham in 1831 was 1543, chiefly agricultural. There is an almshouse for three poor men, and a place of worship for Wesleyan Methodists.

The Hedinghams are in Hinckford hundred, and on a road branching off from the Bury and Norwich road at High Garrett, two or three miles beyond Braintree, and reuniting with it at Bulmer Tye, a little before it quits this county for Suffolk. They formerly constituted one parish: from the time of Henry III. they appear as two; Sible Hedingham, on the south-west bank of the Colne, 48 miles from town; and Castle Hedingham, on the north east bank of the river, one mile farther. We subjoin the following particulars respecting them.

Sible Hedingham, area 5490 acres. Population in 1831 2194. Living, a rectory in the jurisdiction of the Commissary of Essex and Herts, concurrently with the consistorial court of the bishop of London, of the yearly value of 905*l.*, with a glebe-house. Castle Hedingham, area 2600 acres. Population in 1831 1220. Living, a donative in the archdeaconry of Middlesex, of the yearly value of 129*l.* The population of these places is more than half agricultural.

Sible Hedingham church is a neat and tolerably spacious building, supposed to have been erected in the reign of Edward III. There was formerly a chantry here, founded by the executors of Sir John Hawkwood, whose monument, now demolished, stood in the church: the house of the chantry priest is still standing; it had been originally built for the reception and entertainment of devout pilgrims, and still retains the name of the hostage. The castle, which gives name to the parish in which it stands, was built by the De Veres, to which family the lordship of Hedingham was given by the Conqueror. Its architecture, which is very similar to that of Rochester Castle, leads to the supposition that it was erected about the same time as that fortress, viz., towards the close of the eleventh or the beginning of the twelfth century. Maud, wife of king Stephen, is said to have died here. In the civil wars of the reign of John, it was held by Robert de Vere, earl of Oxford, for the barons, and was taken A.D. 1216 by the king. it was retaken in the beginning of the reign of Henry III. by Louis, dauphin of France, but recovered by the earl of Pembroke, governor to the young king. In the reign of Henry VII. that prince was sumptuously entertained here by John de Vere, earl of Oxford, who had suffered severely for his attachment to the Lancastrian cause, and had been one of the chief instruments in placing the crown on Henry's head. As the king was departing, he observed that the earl, to do him honour, had put liveries on his retainers, and in return for his hospitality compelled him to compound by a fine of 15,000 marks for breaking a statute, recently passed, forbidding such a practice. The De Veres retained the castle until A.D. 1625. It has since passed through various hands. The keep is the only part remaining; it is one of the finest and best preserved Norman keeps in the kingdom. The walls are above 100 feet high, and from 11½ to 12½ feet thick at the bottom, and from 9½ to 10 feet thick at the top: the eastern wall is at least a foot thicker than the others, having been so built, it is conjectured, in order to withstand the violent easterly winds. The building is a parallelogram, of 55 feet on the east and west sides, and 62 feet on the north and south. At each angle on the top there was formerly an embattled turret; two of the turrets are remaining: the parapet, now destroyed, was also embattled. The castle is built with irregular flints or stones, imbedded in grouting or fluid mortar, and is cased on the outside with squared stone very neatly and regularly put together. It has five stories, including the ground-floor and platform: the principal entrance is on the first story, and on the west side, with a flight of stairs leading up to it: entrances to the ground-floor were made with great labour in 1720 by the proprietor, who wished to convert that floor into an outhouse. The whole building is worthy of attention; it has some fine Norman enrichments in the interior. Castle Hedingham church is an antient fabric of stone with brick battlements, partly in the Norman and partly in the Early English style: the tower is of much later date. In the chancel is a superb, but somewhat mutilated monument of John de Vere, earl of Oxford, who died A.D. 1539. A Benedictine nunnery was founded here by the first earl of Oxford and his wife, A.D. 1190. Its revenues at the dissolution were valued at 29*l.* 12*s.* 10*d.* The nunnery, long since converted into a farm-house, and part of the chapel belonging to it, are yet standing. There was also an hospital for the sick and decrepit poor at Hedingham, attached to which were two or three chaplains with a clerk and servant. This hospital has long been destroyed: it was on the south-east side of the castle.

Leigh is in the hundred of Rochford, about 36 miles from London. The houses are principally arranged in one street running along the foot of an eminence and on the bank of the Thames. The summit of the eminence commands a fine prospect, and is crowned by the church with its ivy-mantled tower, and the manor-house. The population (1254 in 1831) consists chiefly of fishermen. The place has some trade, and there is a small customhouse here. The Wesleyan Methodists have a meetinghouse. Some Roman coins have been discovered at Leigh.

Leyton, or Low Leyton, derives its name from the river Lea, near to which it is situated; it is in Becontree hundred, about 5 miles from London. It had in 1831 a population of 3323, of which less than one-third was agricultural. The village contains several residences of London merchants and tradesmen. The church is pleasantly situated, overlooking the marshy valley of the Lea, but possesses no beauty of architecture. Among the tombs in the chancel is that of the historian and antiquary John Strype, who was vicar of the parish for nearly seventy years. Leytonstone is a hamlet of this parish. It was supposed by Camden that Leyton was a Roman station, the Durolitum of Antoninus; but though the name as interpreted by some (according to whom Durolitum signifies 'the water of Ley') gives countenance to the supposition, it does not accord with the distances of the *Itinerary*. Roman and other antiquities have been however found at Leyton in considerable number: such as the foundations of buildings; Roman intermingled with other bricks; a subterranean arched gateway, and steps leading down to it; urns with bones and ashes; wells; a quantity of oak timber mortised together like a floor, grown very hard and black, and of uncertain extent; Roman silver and brass coins, consular and imperial, and some silver coins with Saxon characters. At Ruckholts, or Rockholts, a manor in this parish, are some remains of antient entrenchments, a square double embankment, with an intervening ditch, enclosing a circular embankment, thirty-three yards in diameter, surrounded by a moat; both are much obscured by trees.

St. Osyth is in the hundred of Tendring, 62 miles from London and 11 from Colchester, on the marshy coast at the north-eastern side of the mouth of the Colne. A small creek, or arm of that river is navigable for small boats up to the quays in this parish. The population in 1831 was 1583, chiefly engaged in agriculture. The original name of the place was Chich, and it took its name of St. Osyth from a virgin said to be of royal blood, but whose history involves too glaring an anachronism to be worthy of credit, who founded here a nunnery, afterwards destroyed by the Danes. An abbey for the canons of St. Augustin was subsequently founded here in or before the year 1118, in honour of St. Peter, St. Paul, and the above-mentioned St. Osyth. The yearly value of the revenues of this abbey at the dissolution was 758*l.* 5*s.* 8*d.* gross, or 677*l.* 1*s.* 2*d.* clear. The quadrangle of the antient monastic buildings is almost entire, excepting on part of the north side, where it has been replaced by modern apartments; the entrance is by a beautiful gateway of hewn stone mixed with flint, having two towers and two posterns: the stables and offices on the east and west sides of the court bear marks of great antiquity, and among the ivy-grown ruins of the garden is a pier with a Latin inscription describing the antient magnificence of the place. There are a battery, or martello tower, on the coast in this parish, and a signal station. The church contains several monuments of the D'Arcy family.

Prittlewell is in Rochford hundred, 39 miles from London, on the northern shore of the æstuary of the Thames. Milton, now a hamlet of this parish, is said to have been antiently a distinct parish; part of it has been

swallowed up by the sea gaining on the land. Morant, writing near the middle of the last century, says, 'it had a church, or chapel of ease, the remains of which were visible not long ago at low-water mark.' The village consists of two streets, on the slope of a hill, forming a right angle with each other, and having the church at the vertex on the summit of the hill. The church has a nave and chancel, a side aisle running the whole length of the building, and of nearly equal breadth with the nave. There is a fine western tower (in the Perpendicular English style) embattled, with strong buttresses and rich pinnacles: from its height and lofty situation it is a good sea-mark. There was once a priory of Cluniac monks here, cell to an alien priory of the same order at Lewes, in Sussex, but afterwards made independent: its yearly revenue at the dissolution was 194*l.* 14*s.* 3*d.* gross, or 155*l.* 11*s.* 2*d.* clear.

Southend is a hamlet of Prittlewell. It is pleasantly situated on the side of a wooded hill, and is in some repute as a bathing-place. The terrace, in what is commonly called New Southend, or the upper town, is a handsome range of buildings. There are a good hotel, an assembly-room (beside one at the hotel), a theatre, and a library, the last somewhat in the Gothic style. There is an Independent meeting-house. The population of the whole parish of Prittlewell was, in 1831, 2266; nearly half agricultural.

Stansted Montfichet is 32½ miles from London, on the Newmarket road, partly in Clavering half hundred, and partly in Uttlesford hundred. It consists mainly of a long straggling street. The name, Stansted, is supposed to be corrupted from Stone Street, the name of a Roman way, on or near which it stood; the epithet Montfichet was the surname of William Gernon, to whose father the lordship had been given by the Conqueror, and who built a castle here; the artificial mound on which the keep was built yet remains. It may be doubted whether the place took its name from the builder of the castle, or *vice versâ*: population in 1831, 1560.

The Sokens, including Kirby le Soken, Thorpe le Soken, and Walton le Soken, are in Tendring hundred: these parishes are for ecclesiastical purposes consolidated, and form a benefice in the diocese of London (exempt from the archdeacon's jurisdiction), of the annual value of 513*l.*, with a glebe-house. The word Soken is derived from the Saxon Soc, or Soca, signifying a peculiar power to administer justice within itself, and likewise the circuit within which such power was exercised. These villages possess some peculiar immunities, to which they owe their designation. They comprehend the promontory of the Naze, which formerly extended much farther to the west, but has been contracted by the encroachment of the sea. Ruins of buildings have been discovered under the water, particularly on a shoal called the West Rocks, nearly five miles from the shore, which is left dry at great ebbs. The spot where the ruins are found is distinguished by the name of The Town. The wall thrown up to keep out the sea gave name to Walton parish. There is a church in each parish; that at Thorpe is the largest. There is also a Baptist meeting at Thorpe, and a customary market is held there on Wednesday evening. Walton having the recommendation of a firm and extensive beach, has been resorted to for bathing by invalids from the eastern parts of Essex. The population of the three parishes in 1831 was as follows:—Kirby 972, Thorpe 1173, Walton 469; total 2614.

Walthamstow, is in Becontree hundred, a little to the left of the Newmarket road, about 6 miles from London, between the marshes of the Lea and Epping Forest. It contains a number of good houses usually occupied by persons engaged in business in London; but Walthamstow is not so much resorted to by these as formerly; its population has therefore diminished. The population in 1831 was 4258; above a third were employed in agriculture. The church possesses no architectural beauty. There are copper and oil mills in the parish. Wanstead, in the same neighbourhood, is a village occupied, like Walthamstow, by persons doing business in London; it is much smaller however, containing in 1831 only 1403 inhabitants. Wanstead House, formerly the seat of Earl Tylney, was one of the finest residences in the county of Essex. It was pulled down a few years since, and the materials sold. The park is let out in portions for grazing of cattle. A tesselated pavement of considerable dimensions, and several other Roman antiquities, were dug up in the year 1735.

Wivenhoe is in Lexden hundred, 4 miles from Colchester and 55 from London. It is on the north-east bank of the river Colne, just at the junction of the Roman. The village is on the slope of a hill, and commands a pleasant prospect down the river. Wivenhoe has a commodious quay and a custom-house; it may be considered as the port of Colchester. The population of the parish in 1831 was 1714, of which about one fourth was agricultural. The living is a rectory, of the yearly value of 371*l.*, with a glebe-house.

Woodford is in Becontree hundred, 8 miles from London on the Newmarket road. It is a long straggling place with a number of good houses, inhabited by merchants and tradesmen from London. The population in 1831 was 2548, of which about one-fourth was agricultural; the number of inhabitants had materially diminished since the previous census. The church is a modern erection, but in the antient English style. A group of houses about a mile north from the main part of the village takes the name of Woodford Wells, from a mineral spring, now in little repute.

Writtle is a large village, in Chelmsford hundred, about 3 miles west from the town of Chelmsford. It was formerly a market-town, but dwindled as Chelmsford rose into importance. Morant was inclined to place the Cæsaromagus of the *Itineraries* here; but there is no proof of its having ever been a Roman station. King John is said to have had a palace here, and a square plot of ground, with a moat round it, in which the foundations of a building were dug up about the middle of the last century, is thought to have been the site of it. The church contains a number of monuments, some of them elaborate and elegant. There was, before the Reformation, a hermitage in this parish, attached to St. John's Abbey, Colchester. The population in 1831 was 2348, nearly two-thirds agricultural.

There are several large villages in Essex beside those already noticed. Four (Dagenham, Finchingfield, Hornchurch, and Great Waltham) had, in 1831, above 2000 inhabitants; five others had above 1500; and nineteen others had more than 1000.

Divisions for Ecclesiastical and Legal Purposes.—Essex constitutes the largest part of the diocese of London, which is in the ecclesiastical province of Canterbury; and is divided between the three archdeaconries of Colchester, Essex, and Middlesex. The office of rural dean has been disused for many years; the county is, however, still divided into deaneries, which are thus arranged.

The deaneries of Colchester, Lexden, Tendring, Newport, and Sandford constitute the archdeaconry of Colchester. The deaneries of Barstable, Barking, Chafford, Chelmsford, Dengie, Ongar, and Rochford constitute the archdeaconry of Essex. The deaneries of Dunmow, Harlow, and Hedingham constitute part of the archdeaconry of Middlesex, which extends beyond this county.

The number of benefices we cannot exactly give. The Population Returns for 1831 contain the names of 409 parishes and 4 district chapelries (Basildon, Brentwood, Canvey Island, and Epping), together 413 benefices; but of these three (Bures, Haverhill, and Keddington or Kitton) are mostly in Suffolk; and Ballingdon or Brundon (antiently Berington) is for ecclesiastical purposes united to the parish of All Saints, in Sudbury. The parishes of Bocking, Stisted, Latchingdon-with-Lawling, and Southchurch are in the peculiar jurisdiction of the archbishop of Canterbury. Of the above parishes, 16 are in the borough and liberties of Colchester, 2 in the borough of Harwich, and 3 in that of Maldon.

Morant, in his History of Essex, gives the following as the number of churches and chapels. In the archdeaconry of Colchester, 161; in that of Essex, 175; in that of Middlesex, 83; peculiars 4; total, 423: but this, no doubt, includes chapels of ease, or non-parochial chapels. In Gorton's Dictionary the number of parishes is given at 405, which agrees with the number in the Population Returns, deducting the three which are mostly in Suffolk, and that of Ballingdon, which is ecclesiastically united to a Suffolk parish. Lewis's Dictionary gives the number of parishes at 400, of which 250 are rectories, 134 vicarages, and the remainder perpetual curacies.

Dissenters are numerous in Essex, especially the Independents; nearly all the towns and many of the villages have congregations of this persuasion, and some of the congregations are very large. The Baptists have also many meeting-houses; the Wesleyans, we believe, not so many,

the Quakers have places of worship in several of the large towns.

Essex is in the home circuit. The assizes and quarter-sessions are held at Chelmsford, where is the shire-hall, an elegant structure, and the old county-gaol and house of correction. The new county-gaol is at Springfield, a village about a mile from Chelmsford, on the road to Colchester.

For the election of members of parliament the county was, by the Reform and Boundary Acts, divided into two parts, each returning two members. The northern division comprehends the hundreds or half hundreds of Clavering, Dunmow, Freshwell, Hinckford, Lexden, Tendring, Thurstable, Uttlesford, Winstree, and Witham. Braintree is the chief place of election, and the polling-stations are Braintree, Colchester, Saffron Walden, and Thorpe-le-Soken. The southern division comprehends the hundreds or half hundreds of Barstable, Becontree, Chafford, Chelmsford, Dengie, Harlow, Ongar, Rochford, Waltham, and the liberty of Havering. The chief place of election is Chelmsford, and the polling-places are Chelmsford, Billericay, Romford, Epping, Rochford, and Maldon. The boroughs of Colchester, Harwich, and Maldon continue to return two members each, as before the Reform Act. By the Boundary Act an addition (the parish of Heybridge) was added to Maldon. The boundaries of the other boroughs remain as before. None of the old parliamentary boroughs disfranchised or the new ones created by the Reform Act are in this county. The only change in the number of representatives made by that act was by the division of the county and the consequent addition of two representatives.

History and Antiquities.—In the earliest dawn of the authentic history of our island, Essex was inhabited by the Trinobantes (Τρινοαντες), a powerful tribe whose dominions perhaps extended across the Stort and the Lea into Hertfordshire and Middlesex. At the time of Julius Cæsar's invasion (B.C. 55 and 54), Imanuentius, as he is called in Latin, prince of the Trinobantes, had been slain by Cassivellaunus, the predominating chieftain of a neighbouring tribe, and his son, Mandubratius, had been driven into exile, and had gone as a suppliant to Cæsar in Gaul. Cæsar's success induced the Trinobantes to implore of him the restoration of their native prince: and Cæsar, acting upon the usual policy of the Romans, which was to secure allies in or near the countries which were the objects of their attack, complied with their request. Mandubratius was restored, and afterwards secured in the possession of his throne by an express stipulation in the treaty between Cæsar and his British opponents. The alliance of Rome seems to have promoted the aggrandizement of the Trinobantes: Cunobelin, king of that tribe, was a potentate of considerable name, and some coins of his yet extant attest the commencement of civilization and the arts in this county. [BRITANNIA.] Cataràtacus (Καμαράτακος, Dion.), or, as he is commonly called (after Tacitus), Caractacus and Togódumnus (Τογόδουμνος, Dion.), sons of Cunobelin, succeeded to their father's power, and had to bear up against the weight of Roman hostility when the invasion was renewed in the reign of Claudius (A.D. 43). After sustaining several severe defeats, the Britons retired into the marshes of Essex, and fighting with the vigour of despair, were enabled for a time to repel their assailants, though with the loss of Togódumnus, one of their leaders. But the arrival of the Emperor Claudius was the signal for the renewal of the attack. The Trinobantes were subdued, and their capital, Camulodunum (Καμουλοδουνον, Dion. Καμουδολανον, Ptol.), was taken, and subsequently made the seat of a Roman colony, which was however destroyed in the revolt of the Britons under Boadicea, and the Roman garrison slaughtered The defeat of the ninth legion, which was coming to the relief of the colony, under the command of Cerealis, who escaped with his cavalry to his camp and there stood a siege, added to the exultation of the Britons, who captured Londinium and Verulamium and massacred the inhabitants: but the bloody overthrow of Boadicea by Suetonius (A.D. 61) put an end to their revolts, and decided, though it did not complete, the reduction of South Britain. Several of these events occurred in this county. In the Roman division of Britain, Essex was included in Flavia Cæsariensis.

Mr. Lethieullier (Morant's *Essex*) places the final defeat of Boadicea 'somewhere between Epping and Waltham, near which a fine camp remains:' but others place it in the fields immediately north of London. [BRITANNIA.]

Several Roman stations were in Essex. Of these the most important is Camulodunum, upon the determination of the site of which depends that of the others. Three sites in this county have been proposed, Walden, Maldon, and Colchester. One antiquary (N. Salmon) places it at Castle Camps, in Cambridgeshire; other opinions, which place it in Yorkshire or in Scotland, may be dismissed at once. For Walden little seems to be urged but the pleasantness of the situation, an attribute which Tacitus ascribes to Camulodunum; for Maldon there appears to be little evidence, except the resemblance of the name and the opinion of Camden; while abundance of Roman antiquities, the pleasantness of its situation, the agreement of its distance from London with that given in the *Itinerary* of Antoninus, and the termination of its name—chester—a usual indication of a Roman station, agree in supporting the claim of Colchester. Perhaps the first part of its name also may be taken as evidence; for although the names of our waters are commonly of British origin, we may suppose that the Colne (whence Colchester) obtained its designation from the Roman *colonia*, which graced its banks.

The two Iters of the Antonine *Itinerary* which connect Camulodunum with Londinium are thus given:—

Iter IX. à Camuloduno.		Iter V. à Londinio.	
Canonio	M.P. IX.	Cæsaromago	M.P. XXVIII.
Cæsaromago	M.P. XII.	Colonia	M.P. XXIV.
Durolito	M.P. XVI.		
Londinio	M.P. XV.		
	M.P. LII.		M.P. LII.

It will be observed that although the distances between Cæsaromagus (the only intermediate station mentioned in both Iters) and Londinium and Camulodunum respectively do not agree, the total distance between the two extremes is the same in both, viz., Millia Passuum LII, about equal to 48 English miles, which is nearly the distance of Colchester from London in a straight line, and it is known that the Roman roads were commonly straight. The distances given in Iter IX, which we take to be the most correct, will agree tolerably well with the positions assigned to the other stations in the map of antient Britain, published by the Society for the Diffusion of Useful Knowledge, viz., Durolitum, near Romford; Cæsaromagus, near Widford, a village about a mile south-west of Chelmsford; and Canonium, near Kelvedon. If these positions are fixed with tolerable approximation to accuracy, the Roman road must nearly have coincided with the modern road from London to Colchester, which is probable.

It is supposed however to have crossed the Lea at Oldford, not Stratford; but this seems doubtful; possibly there were two branches of the road, one passing at each place. The positions assigned to these stations in Morant's *Essex* agree with those in the Society's map, except that Durolitum is placed below Brentwood, and Cæsaromagus at Chelmsford, or rather Writtle, which is a mile or two west of it, and not far from Widford. Another station of the Antonine *Itinerary*, Ad Ansam, was probably on the border of the county, perhaps at Stratford, just across the Stour, in Suffolk. It is given as distant from Camulodunum M.P. VI, which accords very well with Stratford.

A Roman road, the line of which is still visible in many places, crossed the county from Bishop Stortford, in Herts, by Dunmow, Rame Hall, Coggeshall, and other places, to Colchester. A record of the time of John describes this as 'calcea quæ tendit de Sterteford versus Colcestr.'

Roman antiquities have been dug up in many parts of the county, but especially at Colchester, where urns, pavements, and medals have been found in great abundance, and almost every antient building shows a greater or less proportion of Roman materials worked up in its walls. Round Colchester are the remains of intrenchments and other military works. Tesselated pavements and other antiquities have been discovered on Mersey Island, which Morant supposes to have been the residence of a Roman functionary, the 'Comes Littoris Saxonici,' or count of the Saxon shore. Roman remains have also been found at Wanstead; at Canewdon, not far from Rochford; at Coggeshall; at Toppesfield, not far from the Hedinghams; at Ridgwell, in the same part of the county, near which a

Roman road was formerly visible; at Watsoe bridge, between Birdbrook and Steeple Bumpstead parishes, near the Stour, where is a Roman camp; and at Great Chesterford (near Saffron Walden), which was undoubtedly the site of a Roman station. Antiquaries have sought to identify this station with the Camboricum or Iciani of Antoninus; but it is very difficult to reconcile its site with the distances of the Iter v. of Antoninus, in which it is mentioned.

Colchester appears to have been, in the latter period of the Roman dominion, the seat of a bishop's see. Adelfius, the bishop of Colon or Colchester, assisted at the councils of Arles, A.D. 314; Sardica, A.D. 347; and Ariminum, A.D 359.

When the Saxons established themselves in Britain, Essex, with some parts of Hertfordshire and Middlesex, constituted a small kingdom, the possessors of which were, from their relative situation, called the East Saxons; from them the county has derived its present designation. Middlesex also, it may be observed, owes its name to its situation between the East and West Saxons; although it never had the rank of an independent kingdom.

Essex, according to Morant, was part of the territory extorted from Vortigern or Gwrtheyrn (A.D. 477) by Hengist, a chieftain whose fame, like that of other heroes in semi-fabulous periods, seems to have been augmented by the achievements and acquisitions of others of inferior reputation. Mr. Turner (*Hist. of Anglo-Saxons*), with better judgment refers the foundation of the kingdom of Essex to a later period (A.D. 530), and to a leader, whose name he does not give, but who is elsewhere called Erchenwin. Morant supposes this Erchenwin to have revolted from under the weak government of Octa, king of Kent, without, so far as appears, any reason except that he had originally included Essex in the conquests of Hengist, and therefore in the kingdom of Kent. This kingdom of Essex gradually extended across the Lea into Middlesex and Hertfordshire, and comprehended London, then a flourishing trading place, and which appears to have become the capital of the East Saxon kingdom. The successor of Erchenwin was Sledda, and the successor of Sledda Saebyrht or Sabert. The latter was the nephew of Æthelbyrht or Ethelbert, king of Kent, the first of the Saxon princes that embraced Christianity, and was in subjection to his uncle, at that time the most powerful of the Anglo-Saxon kings. Saebyrht embraced Christianity; the episcopal church of St. Paul in London was founded by Æthelbyrht, and Mellitus, who had been sent from Rome to assist the missionary St. Augustin in evangelizing England, was appointed bishop of Essex, into which kingdom he had been sent as missionary by Augustin. Saebyrht himself founded the abbey and church of Thorney, afterwards called, from its situation with respect to St. Paul's, West Minster (A.D. 604-611). We notice these events because, though not immediately connected with the county of Essex, they are among the most important occurrences in the scanty annals of the East Saxon kingdom.

Upon the death of Saebyrht (A.D. 616), Saxred, Siward, and Sigebriht ascended the throne, and reigned conjointly: they restored Paganism and persecuted Christianity, and appear to have been killed together about A.D. 623. Sigebriht the Little reigned after them from A.D. 623 to 653; and after him reigned Sigebriht or Sigeberht the Good, who, being converted by his friend Oswy, king of Northumberland, whom he used frequently to visit, and baptized by Finan, bishop of Lindisfarne, restored Christianity in Essex, and sent for some Northumbrian monks to come and instruct his subjects. Cedd, one of these, was consecrated bishop of the East Saxons (A.D. 653). Sigebriht was assassinated two years afterwards (A.D. 655). The subsequent kings of Essex were as follows:—Swithelm, Sibbi, and Sighere; the latter died A.D. 683, and Sibbi turned monk A.D. 694: Sigehard and Senfrid: Offa, who went to Rome, and turned monk, A.D. 707: Suebricht, called Selred by some, but erroneously: Swithred was reigning A.D. 758. There were a few others, whose very names are unknown. The dates are from Morant chiefly, but in so uncertain and confused a period they cannot be relied on as very exact.

In A.D. 823, Egbert of Wessex, who had just gained over Beornwulf of Mercia that victory which established the permanent supremacy of Wessex over the other kingdoms of the Octarchy, despatched his son Ethelwulf and the war-like statesman Ealstan or Alstan, bishop of Sherbourne, into Kent and Essex; and these kingdoms, which had sunk into mere dependencies of Mercia, were subdued, and probably united under the designation of the kingdom of Kent, occupied by Ethelwulf as subordinate to his father, and of which mention is occasionally made in the history of Ethelwulf and his sons, until the reign of Alfred, by whom the Saxon kingdoms were finally incorporated; and England, with the exception of those parts which were occupied by the Danes or retained by the Britons, was consolidated under one sceptre.

When Alfred, after the recovery of his throne, assigned to the piratical Northmen, or Danes, a settlement in and about East Anglia (A.D. 878), Essex was included in the ceded territory. One or two of the naval conflicts between the ships of Alfred and those of the piratical Danes who continued to infest the coast, were fought off the Essex shore. Thirteen or sixteen sail of Danish vessels were destroyed in the mouth of the Stour, near Harwich (A.D. 884); but the victorious fleet was destroyed near the Thames mouth by some ships fitted out by the colonists of East Anglia in violation of their engagements with the king. On the death of Godrun (A.D. 890) Essex returned under the government of Alfred, who appointed Bertheolf earl of the county. When Hastings invaded England, A.D. 894, and the main part of his army had been defeated at Farnham, in Surrey (A.D. 894), part of the fugitives escaped over the Thames and marched across Middlesex and Essex pursued by Alfred, until they crossed the Colne and found refuge either in Mersey Island (Turner), or more probably in the peninsula of Brightlingsea (Breklesey, Speed, Morant), where some of their ships had come, and where the king had not any navy at the time to press the siege. Alfred in person, and afterwards when he was called away, his generals, maintained a close blockade on the land side, and at last the Danes sued for peace and agreed to retire from England; but instead of doing so, they hastened to join Hastings, who, with another part of his forces had, in the mean time, landed at South Bemfleet, or Benfleet, in Essex, on the æstuary of the Thames, and built a fort there. In the absence of Hastings, the Londoners and the troops who had blockaded Mersey, stormed his fort, took his wife and two of his children prisoners, recovered a quantity of plunder, and broke up and burned many of his ships, or carried them away to London and Rochester. The wife and children of Hastings were loaded with presents by Alfred and sent back to the piratic chief; but his hostility was not thereby softened. He erected another fortress (of which large traces appear still to remain) at South Shoebury, in Essex, a few miles from his former one. With his main army he crossed the island to the Severn; but was compelled to return with baffled and weakened forces. Before the winter came on he assembled another army, and marched to Chester and into North Wales; but being every where watched by the vigilance of Alfred, he marched back through Northumberland and Mercia to Mersey Island, in Essex, the coast of which he always chose for his strongholds, and in which he seems to have wished to establish a kingdom. Ultimately the Danish chief was compelled to abandon England after three years of incessant hostility (A.D. 894—896), and Essex returned peaceably under the West Saxon sway.

After the death of Alfred (A.D. 901), and the choice of Edward the Elder as his successor, Æthelwald, or Ethelwold, son of Ethelbriht or Ethelbert, Alfred's elder brother, claimed the throne, and having taken to a piratical life, and obtained foreign aid, returned and subdued Essex. The subsequent death of the invader in battle (A.D. 905) put an end to the strife, and restored Essex to the sway of Edward, who subsequently rebuilt or fortified Witham (A.D. 913), in order to bridle the rebellious temper of the Danish colonists; and some years after (A.D. 920) fortified Maldon. In A.D. 921 he took by storm Colchester, which the Danes, with whom he was now at war, had held, and strengthened the place by repairing the fortifications; he also defeated an attack of the Danes upon Maldon.

In A.D. 991, in the reign of Ethelred II., Essex was again the object of Danish attack. A large force landed and attacked Ipswich, in Suffolk, and marching from thence to Maldon, defeated and slew the governor, or earl of the county, who had collected some forces to oppose them they were bought off by the payment of a large sum. In

A.D. 994 the coast of this county was ravaged by them; they were again bought off. Essex was one of the counties ceded by Ethelred to Svein, king of Denmark, by treaty A.D. 1010 or 1011.

In A.D. 1016 Essex was the scene of a fierce battle between Canute and Edmund Ironside, who had succeeded to the thrones and the hostility of their respective fathers, Svein and Ethelred. Canute, by the treachery of Edric (brother-in-law and foster-father to Edmund), obtained the victory. The battle was fought at Assandun, which some suppose to be Ashdon, in the north-western part of the county, near Saffron Walden; others, with more probability, fix the scene of conflict at Assingdon, or Ashingdon, in the hundred of Rochford. At Canewdon (the name of which is probably derived from that of the victor), a parish which adjoins Assingdon on the east, are the remains of a camp, supposed to have been that of the Danes; its form is oblong, and it comprehends an area of about six acres: the vallum has been levelled, but the fosse is yet visible. (*Beauties of England and Wales.*)

The history of the county is not marked by any particular event until the civil war between king John and his barons. In A.D. 1215 the earl of Winchester, one of the confederated lords, with an army of foreigners whom he had brought into the country, besieged Colchester castle, but withdrew upon hearing that relief was coming from London. However, he or some of his party soon afterwards took it and plundered the town. The king however retook it after a few days' siege. During the minority of Henry III. Colchester fell into the hands of the Dauphin Louis (A.D. 1218), who had been invited over by the discontented nobles. At the siege of Calais by Edward III. Colchester furnished five ships and 170 mariners.

In the reign of Richard II. occurred the arrest of Thomas of Woodstock, duke of Gloucester, the king's uncle, who was at the time residing at his castle of Pleshy in Essex, about 6 miles north-west of Chelmsford. There the king visited him, and at the close of his visit invited him to return to town. At Stratford the king had placed in ambush the earl marshal and his followers, who arrested the duke on a charge of high treason. he was subsequently smothered at Calais, and his body being brought to England was buried in the church of Pleshy, which he had himself founded.

Of the troubled period to which the above incidents may be referred Essex contains several memorials in the encampments. castles, and other ruins which are found in it. Various camps may yet be traced referrible to the British, Roman or Saxon periods, as that which incloses the village of Danbury (Danes-byrig), on a high hill between Chelmsford and Maldon; those at Maldon (probably the work of Edward the Elder), at Witham, at Ambresbury banks, near Epping, at Ruckholt, near Barking, at South Weald, near Brentwood, at Canewdon, and at Blunt's walls near Billericay. Many of these have been already mentioned. Of the castles of the Norman period there are also several remains. Those at Colchester, Hedingham, Walden, Ongar, and Raleigh, have been noticed in this article or under their respective heads. Pleshy was the site of a Roman camp or station, and some Roman antiquities have been found at it. The castle was probably built by William de Magnaville, to whose father, Geoffrey de Magnaville, the place had been granted by the usurper Stephen. The keep with the moat which surrounded it were within the Roman intrenchment: the mound on which the donjon was built, and the bridge which led to it over the surrounding moat, are all that remain of the once proud structure. Of Hadleigh Castle, near Raleigh, dilapidated portions of two towers yet remain, forming picturesque masses of ruin. At Clavering in the north-west part of the county are the mound on which the keep stood and the moat of a castle, long since destroyed.

Of the halls and manor-houses which succeeded the Norman castles and gave indication of a quieter period, though showing by their massive strength that the nation had not quite settled into peaceful security, may be mentioned Heron Hall, near East Horndon, Nether Hall, near the confluence of the Lea and the Stort, Tolleshunt Beckingham or Tolleshunt Magna, between Maldon and Colchester, Layer Marney Hall, in the same neighbourhood, Belhus or Bellas House, near Purfleet, Covet or Covell Hall, near White Roding, Eastbury, near Barking, Danbury Place, between Chelmsford and Maldon, New Hall, near Chelmsford, and Toppinghoe Hall, between Chelmsford and Witham. Of Heron Hall two picturesque round towers remain; and of Nether Hall, a vast gateway with two half hexagon towers, one on each side, so massive as to prevent their destruction when the rest of the mansion was pulled down, about A.D. 1773. Of Tolleshunt manor-house there remains an antient brick gateway, with four embattled turrets. Of Layer Marney Hall, the gateway and part of the south side are yet standing, and are converted into a farm-house and offices: it was originally a large quadrangular building, inclosing a spacious court, to which the existing gateway was the principal entrance. Of Covet Hall there remains a gateway of brick, much ornamented. The other houses are, we believe, entire, except New Hall, of which however a large portion remains, formerly occupied by some English nuns from Liege, who took refuge in England from the French Republican armies. Other antient houses have been already noticed in the course of this article, and we have only further to mention Gosfield Hall, near Halsted, which belongs to the duke of Buckingham, and is probably of the time of Henry VII. This mansion is of brick, and incloses a quadrangular court, into which all the lower tier of windows formerly opened. There were no outside windows on the ground-floor, and those of the upper story were strongly barricaded, so as to give to the place considerable strength. The house as originally built consisted of only one room in thickness, and there was no communication round the inside but by passing through every room; but various improvements and additions have been made in modern times. There are a few good pictures, the rest have been removed to Stow, another mansion of the duke. The park is extensive.

At the Reformation Essex possessed several religious houses, of which there are some remains. There were at the time of the Suppression seven of the greater monasteries, that is, of those which according to the valuation of their lands and endowments possessed a clear yearly revenue of above 200*l.*; they were as follows:—

Place.	Description.	Yearly revenue.							
Berking (Barking)	Abbey for Benedictine nuns .	£1084	6	2	gross	£862	12	5	clear
Chich (or St. Osyth)	Abbey for Augustin canons .	758	5	8	„	677	1	2	„
Coggeshall . .	Abbey for Cistertian monks .	298	8	0	„	251	2	0	„
Colchester . .	Benedictine Abbey	..			„	523	17	0	„
Stratford Langthorne	Abbey for Cistertian monks .	573	15	6	„	511	16	3	„
Walden . .	Abbey for Benedictine monks	406	15	11	„	372	18	1	„
Waltham . .	Abbey for Augustin canons .	1079	12	1	„	900	4	3	„

For any further particulars of these see above, or in the articles BARKING and COLCHESTER.

Of the smaller religious houses, the following remains may be noticed in addition to such as have been already mentioned.

The remains of Bileigh or Beleigh Abbey, near Maldon, have been converted into a farm-house and offices; the chapel, the most perfect portion, having been used as a hog-sty. It is small, 36 feet long by 18 broad, formed of a fine-grained limestone, and has groined arches, supported by three slender Purbeck columns. These ruins are chiefly in the Perpendicular style, with some portions of earlier date.

Of Tiltey priory, between Dunmow and Thaxted, the east end of the church remains, and is now used as the parish church: there are also a few of the cloisters yet standing. The church is a remarkably fine specimen of decorated work, with bold buttresses at the eastern angles, and two rich niches for statues. The east window is very fine, ornamented with tracery, and in the interior of the church are some rich stalls.

Of Bycknacre Priory, between Chelmsford and Maldon, the central arches of the church and a small portion of the antient wall remain. They are of very late Norman or Early English character. Of Latton Priory, near Harlow, there are some remains used as a barn; they show that the building contained some good Decorated work. Of Lees Priory, between Chelmsford and Braintree, there is a gate-house, with an embattled octangular tower at each corner, of Perpendicular character. Of Thoby Priory, between Brentwood and Ingatestone, there are some slight remains. The churches of Blakemore or Blackmore Priory, between

Ingatestone and Ongar, and of Hatfield Peverel Priory, between Chelmsford and Witham, have been made parochial: the latter has been much altered; it retains a good Norman door, with zigzag mouldings.

Of the early churches, beside those which we have already had occasion to mention, the following deserve notice:—Greenstead church, near Ongar, is a very curious edifice, and one of the most antient in the kingdom: it seems probable that it was built as a sort of shrine for lodging the body of St. Edmund, king of East Anglia, on its being taken back from London to Bury St. Edmund's, in the early part of the eleventh century; and that it was afterwards enlarged to serve as a parish church. The nave is entirely composed of wood, the sides being formed of the trunks of large chestnut-trees (or oaks) split or sawn asunder, and set upright close to one another. They are let into a wooden sill at bottom, and into a plate at top, and secured with wooden pins: two vacancies are filled up with plaster. There is a boarded tower at the west end, but this does not appear to be so antient as the nave: also a wooden porch on the south side of the nave. The chancel is partly of brick, and the nave is strengthened by brick buttresses. The entire length of the original or wooden part of the church is 29 feet long by 14 broad, and 5½ high to the spring of the roof, which is tiled, and not so antient as the sides. 'Little Maplestead church (near Halsted) is a building of great interest, being the latest of the few round churches in the kingdom; it is of pure Decorated character, and its details plain, but very good.' The chancel end of this church is also semicircular, and is probably the latest erection of that form in England. The diameter of the circular part is about 26 feet (or 30 feet according to others); it has a peristyle of six clustered columns, supporting pointed arches: the whole length of church and chancel is about 60 feet. South Ockendon church, near the Thurrocks, has a round tower, such as may be commonly seen in Norfolk, but not much elsewhere: it has an elaborately and variously enriched Norman door: Corringham and some other churches have Norman portions.

When the Catholic religion regained a temporary predominance over the Reformation under Mary I., the persecution was very severe in Essex. Seventeen persons (five of them women) were burnt at Colchester, and one died in prison; and two persons (one a woman) were burnt at Stratford.

The year 1571 was remarkable for the settlement of the Flemish refugees at Colchester; they introduced the woollen manufacture into that and several other towns in Essex.

When the Spaniards were expected to attack England with their Invincible Armada (A.D. 1588), a camp was formed at Tilbury, where a body of more than 18,000 men, under the earl of Leicester, was posted. Tilbury Fort was then a block-house, which had been built by Henry VIII. to defend the passage of the river; it was at a subsequent period (upon the alarm caused by the Dutch sailing up the Medway, A.D. 1667, and burning the ships at Chatham), enlarged and made a regular fortification, as it is at present. The camp at Tilbury was visited by Elizabeth, whose presence increased the general enthusiasm. Colchester on this occasion furnished two ships and a pinnace to the English fleet. In 1595 the same town furnished three ships for the expedition to Cadiz.

In the war with Spain at the beginning of the reign of Charles I., a Spanish fleet caused alarm by appearing off Harwich; but they made no attempt to land (A.D. 1625). In the civil war at the close of the same reign, Essex was almost entirely in the interest of the parliament, and joined in an association for mutual aid and succour with the other eastern counties of Norfolk, Suffolk, Cambridge, and Herts: this was called the Eastern Association. The towns of Essex and Suffolk, upon a requisition from the committee of both houses, raised 2000 men for the service of the parliament, besides large supplies both of men and money which they sent to the parliament at other times. The county appears to have been exempt from the immediate sufferings of the civil war during the continuance of the main contest; but in the year 1648 it was the scene of one of those isolated and abortive attempts of the royalists, the narratives of which form so many episodes in the great history of the war. A part of the royalist forces, which had been raised in Kent under Goring, earl of Norwich, and Sir William Waller, and were pressed by Fairfax and the parliamentary army, crossed the Thames into Middlesex, and retreating thence into Essex, were joined by the royalists of that county (who had previously seized the parliamentary committee at Chelmsford) and by some royalist gentlemen from Hertfordshire. Their leaders were the earl of Norwich, Lords Loughborough and Capel, Sir Charles Lucas, Sir George Lisle, Sir Bernard Gascoigne, Sir William Campian, Sir William Compton, Sir William Leyton, Sir Richard Hastings, and many other officers and gentlemen. They retired first to Chelmsford, from thence to Braintree, taking in their way Lees House, the seat of the earl of Warwick, and from thence to Colchester, which they entered by convention, after a slight skirmish with the townsmen. To this place Fairfax with his army advanced in pursuit of them, and made a desperate attempt to storm the town. The royalists repulsed him, but with the loss of one of their men of note, Sir William Campian, and nearly 200 men killed and wounded. The Parliamentarians' loss was probably nearly 1000 killed, wounded, and taken. Fairfax now laid close siege to the town, which was blocked up on every side; and two small frigates of ten and eleven guns, which lay in the river to assist the king's party, were taken by some parliamentary vessels from Harwich. After a siege of between two and three months and several severe actions, the royalists were forced to surrender at discretion. The parliamentary general, deeming it necessary to make an example of the leaders of this rising, and being sanctioned by the determination of a council of war, ordered Sir Charles Lucas, Sir George Lisle, Sir Bernard Gascoigne, and Colonel Farre to be executed the day the town was given up. Farre had escaped; Gascoigne, who was a Florentine, was reprieved; but the other two were shot under the walls of Colchester Castle.

In A.D. 1665 and 1666 Colchester suffered severely from the plague. In the abovenamed years 4731 persons died of it: nearly 200 of them in one week. In A.D. 1684 the charter of Colchester was surrendered to the crown, and a new charter granted the same year, which was remodelled by James II. A.D. 1688; but after the Revolution the original charter was restored.

The history of the county presents no later events of any interest.

Statistics.

Population.—Essex is an agricultural county, and but few of its inhabitants are engaged in manufactures. Of 79,023 males twenty years of age and upwards, living in the county in 1831, 43,683 were engaged in agricultural pursuits, and only 871 in manufactures or in making manufacturing machinery. Of these latter 500 were employed in the manufacture of silk goods, principally at Braintree, Great and Little Coggeshall, and Bocking; at Halsted there were 59 silk-machine makers; about 30 men were engaged in the manufacture of gunpowder at the government establishment at Waltham Abbey. At West Ham, in the vicinity of the metropolis, operative chemistry gives employment to several of the inhabitants. Essex ranks the eighth on the list of agricultural counties, and in this respect retains the same position as in 1811.

The population of this county at each of the four periods in which the census was taken during the present century was:—

	Males.	Females.	Total.	Incr. per cent
1801	111,356	115,081	226,437	
1811	124,839	127,634	252,473	11.49
1821	144,909	144,515	289,424	14.63
1831	159,015	158,492	317,507	9.50

Showing an increase between the first and last periods of 91,070, or a little more than 40 per cent., which is 17 per cent. below the whole rate of increase throughout England.

The following table is a summary of the population, &c., of every hundred as taken in 1831:—

HUNDREDS, &c.	HOUSES. Inhabited.	Families.	Building.	Uninhabited.	OCCUPATIONS. Families chiefly employed in agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	All other families not comprised in the two preceding classes.	PERSONS. Males.	Females.	Total.	Males twenty years of age.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the four dates of

	£.		£	s.	d.	
1801 were	137,110,	being		12	1	for each inhabitant.
1811 ,,	312,230	,,	1	4	8	,,
1821 ,,	254,837	,,		17	7	,,
1831 ,,	272,593	,,		17	2	,,

The sum expended for the same purpose in the year ending March, 1836, was 185,394*l.* 17*s.*; and assuming that the population had increased at the same rate of per centage since 1831 as in the ten preceding years, the above sum gives an average of 11*s.* for each inhabitant. These averages are above those for the whole of England and Wales.

The sum raised in Essex for poor-rate, county-rate, and other local purposes, in the year ending the 25th of March, 1833, was 311,961*l.* 18*s.*, and was levied upon the various descriptions of property as follows:—

	£.	s.
On land . . .	251,571	18
Dwelling-houses . .	52,157	2
Mills, factories, &c. .	6,859	2
Manorial profits, navigation, &c.	1,373	16

The amount expended was:—

	£.	s.
For the relief of the poor . .	265,629	6
In suits of law, removal of paupers, &c.	8,190	5
For other purposes . . .	39,928	3
	313,747	14

In the returns made up for subsequent years, the descriptions of property assessed are not specified. In the years 1834, 1835, and 1836 there were raised 291,010*l.* 2*s.*, 260,424*l.* 5*s.*, and 228,811*l.* 19*s.*, respectively, and the expenditure of each year was as follows:—

	1834.		1835.		1836.	
For the relief of the poor .	£239,946	7	£210,045	16	£185,394	17
In suits of law, removals, &c.	6,898	3	7,318	18	5,444	9
Payment towards the county-rate . . .	39,484	9	18,253	14	17,470	10
For all other purposes			23,716	5	20,700	7
Total money expended	£286,3:8	19	259,334	8	229 010	3

The saving effected in the whole sum expended in 1836, as compared with that expended in 1834, was therefore about 20 per cent.; and the saving effected on the sum expended for the relief of the poor was not quite 23 per cent. in 1836, as compared with the expenditure in 1834.

The number of turnpike trusts in Essex, as ascertained in 1834, is 11; the number of miles of road under their charge is 249; the annual income in 1834, arising from the tolls and parish composition, was 34,501*l.* 15*l.* 1*d.*, and the annual expenditure 39,557*l.* 12*s.* :*d.*

The county expenditure in 1834, exclusive of that for the relief of the poor, was 18,847*l.* 10*s.* 6*d.*, disbursed as follows:—

	£.	s.	d.
Bridges, buildings, and repairs, &c. .	728	2	0
Gaols, houses of correction, &c., and maintaining prisoners, &c. .	10,311	17	2
Shire halls and courts of justice—building, repairing, &c. .	245	9	8
Prosecutions	2,382	13	8
Clerk of the peace . . .	1,385	7	4
Conveyance of prisoners before trial .	758	5	1
,, of transports . .	297	7	0
Vagrants—apprehending and conveying	315	18	0
Constables—high and special . .	552	5	2
Coroner	345	17	6
Miscellaneous . . .	1,524	7	11
Total . . .	18,847	10	6

The number of persons charged with criminal offences, in the three septennial periods ending with 1820, 1827, and 1834, were 1908, 2686, and 3837 respectively; making an average of 273 annually in the first period, of 384 in the second period, and of 578 in the third period. The number of persons tried at quarter-sessions, in each of the years 1831, 1832, and 1833, in respect to which any costs were paid out of the county-rates, were 386, 351, and 398 respectively. Among the persons charged with offences, there were committed for—

	1831.	1832.	1833.
Felonies . . .	293	319	321
Misdemeanors . .	93	32	77

The total number of committals in each of the same years was 407, 445, and 460 respectively.

	1831.	1832.	1833.
The number convicted was .	323	315	337
,, acquitted .	52	59	72
Discharged by proclamation	32	71	51

In 1836 at the assizes and sessions 619 persons were charged with crimes in Essex. Of these 49 were charged with offences against the person, 31 of which were for common assaults; there were 74 offences against property, committed with violence; and 442 committed without violence; 1 for sending threatening letters; 8 for forging and uttering false money; 1 for killing cattle; 2 for deer stealing; and 42 for riot. Of the whole number of offenders, 446 were convicted, 123 were acquitted, and against 51 no bill was found, or no prosecution ensued. Of those convicted, 20 were condemned to death, none of whom were executed, 17 had their sentence commuted for transportation, and three for imprisonment; 133 were sentenced to transportation for various periods; 279 to imprisonment, 235 of whom for only six months or under; 2 were whipped; 5 were fined, and 6 discharged on sureties. Of the number of offenders, 547 were males and 72 females; 293 could neither read nor write: 283 could read and write imperfectly; 31 could read and write well, and only 1 had received superior instruction; the state of instruction of the remaining 11 could not be ascertained.

The number of persons qualified to vote for the county members of Essex is 11,119, being 1 in 29 of the whole population, and 1 in 7 of the male population, twenty years of age and upwards, as taken in 1831. The expenses of the last election of county members to parliament were to the inhabitants of the county 159*l.* 5*s.* 9*d.*, and were paid out of the general county-rate.

There are fifteen savings' banks in Essex. The number of depositors and amount of deposits on the 20th of November were:—

	1832.	1833.	1834.	1835.	1836.
Number of depositors	8086	8535	9051	9390	9827
Amount of deposits	£268,333	277,754	289,767	302,061	312,386

The various sums placed in the savings' banks in 1835 and 1836 were distributed as under:—

	1835. Depositors.	1835. Deposits.	1836. Depositors.	1836. Deposits.
Not exceeding £20	5734	£37,301	5388	£38,307
„ 50	2375	73,299	2495	76,480
„ 100	1150	78,931	1204	83,189
„ 150	416	50,139	406	49,270
„ 200	221	37,734	243	41,534
Above 200	94	24,657	91	23,606
	9390	302,061	9827	312,386

Education.—The following summary is taken from the parliamentary returns on education, made in the session of 1835:—

	Schools.	Scholars.	Total.
Infant schools	88		
Number of infants at such schools; ages from 2 to 7 years:—			
Males		684	
Females		756	
Sex not specified		932	
			2,372
Daily schools	1075		
Number of children at such schools; ages from 4 to 14 years:—			
Males		13,559	
Females		12,993	
Sex not specified		4,053	
			30,605
Schools	1163		
Total of children under daily instruction			32,977
Sunday schools	438		
Number of children at such schools; ages from 4 to 15 and 16 years:—			
Males		12,594	
Females		13,354	
Sex not specified		3,712	
			29,660

If we assume that the population between the ages of 2 and 15 has increased in the same proportion as the whole population since 1821; and that the whole population has increased in the same ratio since 1831 as during the ten years preceding that period, we find that the number of children between the ages of 2 and 15 residing in Essex in 1834 was 109,011

Thirty-seven Sunday-schools are returned from places where no other schools exist, and the children (1513 in number) who are instructed therein cannot be supposed to attend any other school; at all other places Sunday-school children have opportunity of resorting to other schools also, but in what number or in what proportion duplicate entry of the same children is thus produced must remain uncertain. Seventy-seven schools, containing 5250 children, which are both daily and Sunday-schools, are returned from various places, and duplicate entry is therefore known to have been thus far created. At a few of the Sunday-schools some scholars are 16 and 17 years of age. Making allowance for these two causes therefore, it appears that perhaps not more than one-half of the children between the ages of 2 and 15 are receiving instruction in this county.

Maintenance of Schools.

Description of Schools.	By endowment.		By subscription.		By payments from scholars		Subscrip. and payment from scholars.	
	Schls.	Scholars	Schls.	Scholars.	Schls.	Scholars.	Schls.	Scholars

The schools established by Dissenters included in the above statement are:—

	Schools.	Scholars.
Infant schools	..	..
Daily	31	1235
Sunday	91	7600—8835

The schools established since 1818 are:—

		Scholars.
Infant and other daily schools	647, containing	18,533
Sunday-schools	230, containing	18,581

One hundred and one boarding-schools are included in the number of daily schools given above. No school in the county appears to be confined to the children of parents of the Established Church, or of any other religious denomination, such exclusion being disclaimed in almost every instance, especially in schools established by Dissenters, with whom are here included Wesleyan Methodists, together with schools for children of Roman Catholic parents.

Lending libraries of books are attached to forty-five schools in this county.

ESSEX, EARLS OF. Walter Devereux, first earl of Essex, the son of Sir Richard Devereux and Dorothy, daughter of George, earl of Huntingdon, was born in Caermarthenshire, at the castle of his grandfather, Walter Viscount Hereford, about the year 1540. He succeeded to the titles of Viscount Hereford and Lord Ferrers of Chartley in his nineteenth year, and was early married to Lettice, daughter of Sir Francis Knolles. When the rebellion, headed by the earls of Northumberland and Westmorland, broke out in 1569, he raised a considerable body of troops, and, in conjunction with other forces, compelled the rebels to retreat into Scotland. The courage that he displayed during this warfare recommended him to Queen Elizabeth, who had ever esteemed his loyalty and superior intelligence: in gratitude for the service that he had rendered her, she conferred on him the order of the Garter, and created him earl of Essex (1572). He now became so great a favourite with the queen, that Leicester and others about the court, jealous of his increasing influence, encouraged Essex to enter upon a scheme for subduing and colonizing a district of the province of Ulster. He had for some time contemplated such an expedition, and having been persuaded to take the command, embarked from Liverpool in August, 1573, in company with Lord Darcy, Lord Rich, and other persons of distinction. He contracted to furnish one half of the expense of the undertaking, in consideration of which he was to have one half of the colony as soon as it was established. His arms at the outset met with various success; but after a time his English friends deserted him, and their loss, together with the enmity of many courtiers at home, soon multiplied difficulties round him. He was obliged to resume the government of Ulster, which he had previously resigned; and he was compelled to make peace with O'Neil when his pursuit of the rebels under that leader gave every prospect of success. He was required to give up his command when he had nearly dispossessed the Scots, who had invaded the western islands in his territory, and with no higher title than that of captain was made to serve at the

head of a small body of 300 men. Feeling himself harassed and oppressed, he returned to England; but having received, with the title of Earl Marshal of Ireland, promises that he should have greater liberty of action allowed him if he would go back to that country, he consented to return to his post. The improvement of his situation, however, was so small that his spirits were affected; the effects of grief were soon visible in his constitution; a dysentery attacked him, and, after a month's pain and misery, he died at Dublin, on the 22nd of September, 1576: his body was removed for interment to the parish church at Caermarthen. The sudden failure of his health gave rise to a suspicion of his having been poisoned; but no evidence whatever could be adduced to prove the fact. The speedy marriage of the Countess of Essex to Leicester, who was charged with the murder of her late husband, did not tend to throw discredit on the report. Essex left two sons and two daughters. Of the sons we subjoin a further account. Of the daughters, Penelope first married Robert Lord Rich, afterwards Charles Blount, earl of Devonshire; and Dorothy first Sir Thomas Perrot, and afterwards Henry Percy, earl of Northumberland. (*Biog. Britan.; Criminal Trials*, vol. i.)

ROBERT DEVEREUX, earl of Essex, the son of the preceding Walter Devereux and Lettice Knolles, was born at Netherwood, in Herefordshire, in November, 1567, and was educated, according to his father's wish, under the superintendence of Lord Burleigh, by whose direction he was sent to Trinity College, Cambridge, in 1577, and remained there four years. Upon leaving the university, he retired for some time to his estate in South Wales, and did not appear at court till 1584. His station, his agreeable manners, handsome person, and vigorous mind soon brought him into notice. He was reconciled to Leicester, now his father-in-law, who had been suspected of causing his father's death; and received the appointment of Master of the Horse from the hands of the queen, who also made him a Knight of the Garter. Elizabeth at the same time remitted the debt to the exchequer incurred by his father; and when Leicester went with an army into the Netherlands in 1587, she gave to Essex, who accompanied him, the responsible commission of a captain-general of the cavalry. On the death of Leicester in 1588, Essex became her chief favourite. In 1589 he suddenly joined the expedition of Drake and Norris, who had undertaken to restore Antonio to the throne of Portugal. The queen, exasperated at his departure from court without giving her notice, despatched the earl of Huntingdon to Plymouth with a peremptory order for his return. The messenger was too late; Essex had sailed. He joined the expedition on the coast of Portugal, marched to Lisbon as a volunteer, behaved himself thoughout the enterprise with great gallantry and humanity, and on his return to England found that, in spite of his disobedience, he retained beyond all comparison the first place in the queen's favour. His chief rivals in her esteem were Sir Walter Raleigh, whose removal from court by the means of an appointment in Ireland has been attributed to the contrivance of Essex, and Sir Charles Blount, of whom he was so jealous, that upon the queen's bestowing a trifling mark of favour upon him at a tilting match, Essex used such insulting expressions to him that a duel ensued, in which the earl was wounded in the knee. In 1591 (a year after he had married a daughter of Sir Francis Walsingham, the widow of Sir Philip Sidney, whom the queen angrily declared to be in all respects unworthy of him), Essex was despatched to assist Henry the Fourth of France in his resistance of the king of Spain, who sought to obtain possession of the duchy of Brittany. He encamped under Rouen, and here, as at Lisbon, idly challenged the governor to a duel. The expedition was wholly unsuccessful, and the earl lost, by a musket-shot, his only brother Walter Devereux, to whom he was greatly attached.

In 1594, Essex, who had once before come into collision with the Cecils respecting the appointment of the queen's secretary, became a second time at variance with them. Having, as he conceived, discovered a plot in which Lopez and others had resolved to murder the queen, he apprised her majesty of his suspicions; but Lord Burleigh and Sir Robert Cecil, who, at the queen's desire, had examined into the case, declared the accusation to be unfounded, so that the queen severely rebuked Essex. Mortified both at this rebuke and at the conduct of his rivals, he renewed the inquiry, and eventually elicited evidence upon which Lopez and his confederates were executed. The opposition of the Cecils to the counsels of the earl of Essex was renewed in 1596. Lord Howard, then lord admiral, advised the queen again to invade Spain, a proposal which Essex warmly seconded; Burleigh, on the contrary, denounced the scheme as impolitic and imprudent. The queen gave her consent to the expedition: Howard and Essex sailed; Cadiz was taken, plundered, and burned; fifty-seven Spanish ships of war and merchantmen were taken or destroyed; and the Spanish government suffered considerable loss. But though the enterprise was successful, and commanded with the greatest gallantry, the benefits resulting to the English government were hardly equivalent to the expense incurred. After some trifling attacks upon the coast of Spain, the fleet, which had been absent little more than two months, returned to England. The enemies of Essex had endeavoured, during his absence, to poison the mind of the queen to his prejudice, but his publication of the 'Censure of the Omissions in the Expedition to Cadiz' completely reinstated him in her favour. He continued to meet with disappointments in his endeavour to obtain official situations for his friends, but was himself created Master of the Ordnance. In July, 1597, Essex, as commander-in-chief, with Lord Thomas Howard as vice-admiral, and Sir Walter Raleigh as rear-admiral, sailed against the Spanish fleet, with a view also of making conquests among the Azores. The English ships, shattered and crippled by a storm, were immediately driven back to Plymouth. In August they again set sail, and though they could not burn the Spanish ships which they now found in harbour, they succeeded in making captures to the amount of 100,000*l.*, with which booty they returned to England in October. The queen received Essex with reproaches and discontent, and the expedition was generally deemed a failure. He now retired to Wanstead, angry on several accounts: the chief of these was the elevation of the lord admiral to the earldom of Nottingham, by which he thought himself doubly affronted; first, because Lord Howard's services at Cadiz were recited, and, in the second place, because, by his new title, Lord Howard gained precedence of him according to a regulation made in the reign of Henry VIII. He was pacified by being appointed hereditary Earl Marshal, which by the same regulation restored him to his rank. In 1598 a quarrel occurred between the queen and Essex, who, having differed from her respecting an Irish appointment, angrily and contemptuously turned his back upon her in the presence of several of the ministers. The queen, unable to bear the affront, gave him a box on the ear, and bade him 'go and be hanged.' Essex immediately seized his sword, and the lord admiral stopping in between, he swore 'that he neither could nor would put up with an affront of that nature, nor would he have taken it at the hands of Henry the Eighth himself.' He withdrew from the court, and some months passed before he would make any submission, or suffer a reconciliation to be effected. His friends dated his ruin from this unfortunate circumstance. It was hastened by the death of Burleigh, which was on the whole a great misfortune to Essex. Had Burleigh lived, Essex might not have undertaken the unfortunate Irish expedition on which he at this time entered (1599). The province of Ulster was in a state of rebellion; and with the hope that his rank and military popularity and power might prevail in that country, he accepted the commission of lord lieutenant of Ireland. His government in that country was inconsiderate and ill-advised; and his opposition to the queen's wishes in the nomination of Lord Southampton to the generalship of the horse, which he was peremptorily ordered to revoke, gave great offence. His delay in sending troops to Ulster, the loss of men and money consequent on the delay, and the ultimate failure of the expedition, were the causes of many and loud reproaches. Essex returned to England in September: at their first interview the queen received him in a friendly manner, but on the following day he was put into 'free custody,' and detained a prisoner in his house. In June, 1600, he was denied the privileges and authority of his offices; and it was not until the 26th of August that he was liberated. The queen still denied him access to court, and refused the renewal of a valuable patent for the monopoly of sweet wines, which his friends used all their endeavours to procure, declaring that 'in order to manage an ungovernable beast, he must be stinted in his provender.'

The weight of these grievances upon his haughty and impetuous mind told the more heavily from the knowledge

that his general popularity was undiminished. So deep was his impression of resentment against those whom he conceived to have biassed the queen against him, that he listened to the rash and desperate advice of Cuffe, his secretary, to remove Cecil, Cobham, and Raleigh by force from the queen's councils. In order to strengthen his interest, the gates of Essex House were thrown open to all persons who were discontented with the queen or her advisers. With the same view, he courted both the Roman Catholics and Puritans, and a concourse met daily to hear sermons in his house. The multitude that attended the delivery of these discourses could not fail to attract the attention of the vigilant government. Essex was warned to be careful of his safety, and his attendance was required before the council. At this summons he took alarm, fearing a renewal of his imprisonment, and consequently the defeat of his scheme. He determined therefore to commence his proceedings on the following morning (Sunday, February 8, 1600-1); and during the night messengers were sent in all directions to acquaint Essex's friends that his life was threatened by Raleigh and Lord Cobham In consequence of this intelligence, Lords Sandys and Monteagle, the earls of Rutland and Southampton, with nearly 300 other gentlemen, assembled at Essex House, where it was divulged that Essex had resolved at once to rid himself of his enemies by forcing his way to the queen, and informing her of his danger from those who had so long abused their influence with her majesty. Essex having shut up within his gates the lord keeper, the chief justice, and others whom the queen, aware of what was passing, had sent to inquire into the cause of the tumult, proceeded with his friends to the city, where, crying 'For the queen, for the queen, a plot is laid against my life,' he tried to enlist the citizens in his favour. But notwithstanding his popularity, not one man took arms. The cause of the tumult was either mistaken or unknown. At length the earl endeavoured to return home, but a party of soldiers met him at Ludgate, and a skirmish ensued, in which he was twice shot through the hat. At length he reached Essex House, but after a short defence he was compelled to surrender himself, and with Lord Southampton was committed to the Tower: the rest of the conspirators were lodged in various other prisons. He was tried for treason in Westminster-hall on the 19th of February, condemned, and executed 25th of the same month. (*Criminal Trials*, vol. i.)

A sketch of the character of Essex has lately appeared in an article in the *Edinburgh Review* (vol. lxv., p. 21), which also displays the ingratitude of Lord Bacon towards his zealous friend and patron. We extract the following remarks:—'Nothing in the political conduct of Essex entitles him to esteem; and the pity with which we regard his early and terrible end is diminished by the consideration that he put to hazard the lives and fortunes of his most attached friends, and endeavoured to throw the whole country into confusion for objects purely personal. Still it is impossible not to be deeply interested for a man so brave, high-spirited, and generous: for a man who, while he conducted himself towards his sovereign with a boldness such as was then found in no other subject, conducted himself towards his dependants with a delicacy such as has rarely been found in any other patron. Unlike the vulgar herd of benefactors, he desired to inspire not gratitude but affection. He tried to make those whom he befriended feel towards him as towards an equal.' His mind was ardent and susceptible, and naturally disposed to the admiration of all that is great and beautiful.

He left one son (of whom we give an account in the next article) and two daughters. Frances married first the earl of Hertford, and afterwards the duke of Somerset. Dorothy was the wife first of Sir Henry Shirley, and lastly of William Stafford, of Blatherwyck, in Northamptonshire.

ROBERT DEVEREUX, third earl of Essex, was born in Essex House, in the Strand, in 1592. He was sent to Eton by his grandmother, who, after his father's death, received him into her house; and in 1602 he was removed to Merton College, Oxford, where the warden, Mr. (afterwards Sir Henry) Savile, who had been an intimate friend of his father, took charge of his education. He was restored to his hereditary honours in 1603, and three years afterwards was unhappily married to lady Frances Howard, a child of no more than thirteen years old. The new-married couple being too young to live together, Essex was sent to improve himself abroad; while the bride, who was celebrated for her beauty, continued with her mother. It was four years before he returned to claim his wife, and in the mean time she had contracted so great an affection for lord Rochester, afterwards earl of Somerset, that until she was compelled by her father, she could not be brought to cohabit with her husband. The union never was a happy one. Not many months after they had met, she instituted proceedings against him praying for a separation on a real or pretended charge of physical disability. A divorce was granted, and the lady was soon after married to lord Rochester. The slur thus cast upon Essex drove him to the retirement of his country-house and the pursuit of rural occupations. After some years however, a solitary life became irksome to him. Tired of inaction, he joined lord Oxford in 1620, raised a troop, and marched with the Elector Palatine in the war against Holland. In the winter he returned to England, where his opposition to the government rendered him unpopular at court; indeed the reception that he met with at home was so little agreeable that he willingly renewed his military avocations abroad during the two following summers, and in 1625 again raised a troop, with which he sailed to aid the United Provinces. His disposition and capability for military service now struck the king, and he was appointed vice-admiral of a fleet which was employed in a fruitless expedition against Spain. He engaged in another expedition in the Low Countries, and was afterwards bold enough to marry a second time. In this second choice of a wife (the daughter of Sir William Paulet) he was scarcely more fortunate than in his first. It is true indeed that the lady soon after her marriage bore a son, which Essex owned and christened after his name, but her familiarities with Mr. Uvedale gave him cause to suspect her fidelity, and after much mutual crimination, on the one side for inconstancy, on the other, a renewal of former charges, a separation took place. The child died at the age of five, and Essex never showed further inclination to matrimony. Between his journey to Ireland in 1632 and his appointment in the fleet that sailed to Holland in 1635, he spent his time either in his house at Chartley, or in London. His inclination to seek popularity among the presbyterians was evident and undisguised; nevertheless the king employed him as lieutenant-general of his troops that were sent against the Covenanters (1639). In 1640 he was one of twelve peers that signed a petition that a parliament should be called and an attempt made to settle the difficulties of the state without further bloodshed. He was also one of the commissioners sent to Ripon to treat with the Scots; and when, at the opening of the Long Parliament, the king saw that it was necessary that he should endeavour to conciliate the presbyterian party, he made Essex lord chamberlain. It was the wish of many of the royalists that Essex, whose popularity was great among the presbyterians, should also have been placed at the head of the army, but Charles, who disliked him on account of the roughness of his manner, and doubted the firmness of his attachment to him, refused to appoint him, and would yield to their requests no further than to make him lieutenant-general of his forces south of the Trent. When the Commons demanded of the king that a guard should be raised in the city of London, it was Essex whom they desired to have placed at its head. Charles, unwilling to listen to this request, left London suddenly, and called upon Essex to follow him; but Essex, indisposed to the king on account of the thankless incivility with which he had always been treated at court, refused to follow, pleading his duty to remain in attendance of parliament. Vehemently angry at this refusal, the king instantly deprived him of all his offices. Essex now became the chief favourite and leader of the parliamentary or presbyterian party. He became parliamentary general in 1642, and was in consequence proclaimed a traitor by the king. He opposed Charles in person at Edgehill (1642); he also took Reading (1643), but on account of a disease with which his troops were infected, he was obliged to abandon any further attack; at which the disappointment of the parliamentary leaders was so great, that they nearly dismissed him from his command. On the recovery and reinforcement of his soldiers he triumphantly entered Gloucester, from which he had driven the king away, surprised Cirencester, and after fighting courageously at the doubtful battle of Newbury, succeeded in covering London. As the supporters of the parliament were supposed to be numerous in Cornwall, in the hope of increasing his forces he marched to that county pursued

by the royalist troops; the number of adherents however had been exaggerated, his expectations were disappointed, and as he was completely hemmed in by his pursuers, the scarcity of provisions began to be severely felt. At this crisis the king proposed a treaty; but Essex had no authority to make any agreement without the sanction of his parliamentary masters; and as the royalists, finding that he did not comply with the king's offer, continued to press their advantage, after some of his troops had abandoned him, he was obliged to escape by sea from Fowey. Having sailed from Plymouth to London, he once more collected an army, and was placed at its head, but an illness compelled him to quit his command. When he returned to London he found a state of confusion and distrust that scarce could be exceeded. At a meeting held at his house it was proposed to impeach Cromwell, but this served no other purpose than to irritate that leader. The independents soon afterwards succeeded in carrying the 'self-denying ordinance,' which forbad members of either house of parliament to hold any command in the army: thus Essex ceased to be parliamentary general. It was voted that for his services he should be raised to the rank of a duke, and be granted a pension of 10,000*l.* a year. He did not however live to enjoy these honours, being carried off by a sudden and violent illness in the fifty-fifth year of his age. He was publicly interred in Westminster Abbey.

The chief defects in his character were indecision and vacillation; when he erred it was more from want of judgment than from bad intention. His bearing was always manly, and his courage has never been impeached. At his death the title became extinct. (Hume's *History of England; Biographia Britannica; Biographie Universelle.*)

ESSLINGEN, the seat of provincial government for the Würtemberg province of the Neckar, as well as for the bailiwic of Esslingen, lies in a fine and fertile country on the banks of the Neckar, surrounded by heights crowned with forests and vineyards, in 48° 44′ N. lat., and 9° 19′ E. long. It is an old town, and was a free city of the German empire, and the favourite residence of some of the emperors. The inner town has massive walls and towers round it; and the five suburbs, one of which stands on an island in the river, while another is attached to the old burg which lies upon a hill, are also protected by stout walls. It has five churches, that of St. Mary being distinguished by its fine Gothic spire, a handsome town-hall, an hospital richly endowed with the property of some suppressed religious houses, a high school, the head seminary of the kingdom for educating teachers, an orphan asylum, several elementary schools, and a population of about 6250, of whom about 100 are Roman Catholics and 100 Jews. Esslingen has manufactures of woollens, cotton and woollen yarns, wine, lackered iron and tin ware, paper, &c., and a good trade in agricultural produce. The parish of Esslingen comprises the well-known Esslingen-Gebiet, a succession of hamlets scattered along the heights between the town and Rothenberg, and carried up to the very summit of the range.

ESSLINGEN, or **ESSLING**, is likewise the name of a small village of about 280 inhabitants, in the circle of the Lower Mannhartsberg, in Lower Austria, about seven miles east of Vienna. It is connected by historical recollections with the adjacent village of Aspern which lies to the west of it. The ground between these two places was the scene of a severe conflict between the French under Napoleon, and the Austrians, which begun on the 21st and terminated on the 22nd of May, 1809, when the latter remained in possession of Aspern, and the former of Esslingen. By the Austrians the conflict was therefore called that of Aspern; but by the French that of Essling, from which village Marshal Massena covered the retreat of Napoleon's forces, and afterwards derived the ducal title bestowed upon him by the French emperor.

ESSOIGNS, Latin *Essonium*, French *Essoigne*, or *Exoine* (apparently from the Latin *Exonerare*, to exonerate, but see Du Cange, in voc. *Sunnis*), is the allegation of an excuse for non-appearance by a person summoned to answer an action at law, or to perform service at a court baron. There were various causes of excuse, such as illness, falling among thieves, floods, &c.

A party might essoign himself three times by sending a substitute to explain the reasons for his non-appearances, and it formerly served as an imparlance or a craving for a longer time by a defendant to make answer in real and mixed actions

Essoign day of the Term. The first return day in every term was, properly speaking, the first day of the term (until essoigns were no longer allowed to be cast in personal actions), and on that day the courts sat to take essoigns or excuses from such as did not appear to the summons or the writ; wherefore it was called the essoign day.

The essoign or general return day is now regulated by 1 William IV., chap. 3, which enacts 'That all writs usually returnable before any of his majesty's courts of King's Bench, Common Pleas, or Exchequer, respectively, on general return days, may be made returnable on the third day exclusive, before the commencement of each term, or on any day, not being Sunday, between that day and the third day exclusive before the last day of the term; and the day for appearance shall, as heretofore, be the third day after such term.'

ESTATE, in law, signifies that title or interest which a man has in lands, tenements, hereditaments, or other effects. It is either real, comprising lands, tenements, and hereditaments held or enjoyed for an estate of freehold; or personal, comprising interests for terms of years in lands, tenements, and hereditaments, and property of every other description. Personal estate [CHATTELS] goes to the executors, and is primarily liable for payment of debts.

Real estate may be considered under three heads:—(1) the quantity of estate, *i. e.*, the amount of interest in the owner; (2) the time when that interest is to commence; and (3) the quality of estate, or the mode in which it is to be enjoyed.

1. All real estates not being of copyhold tenure [COPYHOLD], or what are called customary freeholds, are either of freehold or less than freehold. The former may be divided into two kinds; freeholds of inheritance, and freeholds not of inheritance. Freeholds of inheritance admit of a further subdivision, into inheritances absolute, called fees simple, and inheritances limited, called qualified or base fees, and fees conditional. A freehold of inheritance absolute or fee simple is the largest estate which the law allows to a subject; the owner may freely dispose of it to whom he pleases in his lifetime by deed or by will, and if he dies without making any disposition, it descends to such of his kindred as the law marks out as his heir.

A qualified or base fee has some qualification or limit annexed, which may determine the estate, as in the instance of a grant to A and his heirs *tenants of the manor of Dale.* Whenever A or his heirs cease to be tenants of that manor, their estate is entirely determined, though during its continuance the proprietor has the same rights and privileges as if he were absolute tenant in fee simple.

A conditional fee at common law was a fee restrained to some particular heirs exclusive of others, as to a man and the heirs male of his body, by which limitation his lineal heirs female and collaterals were excluded; and this is the origin of estates tail. It was held that if the donee, in the case supposed, had no heirs male of his body, or if, after a male child was born, no alienation were made, the land should revert to the donor on the failure of heirs male of the donee's body: in fact, for all purposes of alienation it was a fee simple, on condition that the donee had male issue; for it is a rule of law, that when any condition is performed it is thenceforth entirely gone, and the thing to which it was annexed becomes absolutely and wholly unconditional. The nobility however, being anxious to preserve their estates in their own families, procured the Stat. Westm. the Second, 13 Ed. I., c. 1, commonly called the Statute de Donis Conditionalibus, to be made, which enacted that the will of the donor should be observed, and that the land should go to the heirs specified, if there were any, or if none, should revert to the donor. Thus the donor acquired an estate in reversion, which could only be allowed, consistently with the nature of estates in reversion, by considering the conditional fee to be changed into a limited, or, as it is called in technical language, a particular estate. This kind of estate was called an estate *tail*, from the word *talliare*, to cut, being as it were a portion of the whole fee. Means were soon however discovered by the ingenuity of the lawyers to enable the donee and his heirs of the specified description to cut off the entail, as it was called. [CONVEYANCE, FINE, RECOVERY.]

A freehold, not of inheritance, is an estate which the owner has for his own life only, or the life of some other person, or until the happening of some uncertain event. The following are instances:—A gift to A until B returns from Rome; but if the gift had been to A and his heirs

until B returns from Rome, the estate would have been a qualified or base fee; and if B had died without returning from Rome, would have become a fee simple absolute. Some freeholds not of inheritance, arise from operation of law, as tenant in tail after possibility of issue extinct, which is where an estate is limited to A and the heirs of his body to be begotten on the body of B his wife, which is called an estate tail special (as distinguished from an estate tail general, *i.e.* to A and the heirs of his body, without specifying the woman from whom they must spring). If B dies without children, A is no longer tenant in tail, but tenant in tail after possibility of issue extinct, and is regarded by the law, as to the duration of his estate, as simple tenant for life. As to tenant by courtesy and tenant in dower, see COURTESY and DOWER.

Of estates less than freehold there are three kinds—estates for years, at will, and by sufferance. An estate for years (which includes an estate from year to year) is personal property, and, like other chattels [CHATTELS], upon the death of the owner, without having disposed of it in his lifetime, devolves upon his executors or administrators. An estate at will arises where a man lets lands to another expressly at the will of both parties or without limiting any certain estate; either party may put an end to the tenancy, though, for the sake of general convenience, the courts strive to construe them as tenancies from year to year, for the purpose of rendering a six months' notice necessary to their determination. An estate by sufferance arises where a tenant, who has entered by lawful title, continues in possession after his interest has determined: this estate may be put an end to at any time by the lawful owner, though, after acceptance of rent, the law would consider it as a tenancy from year to year, as in the case of a tenancy at will.

Neither of these two last estates confers any power of alienation. All these estates, real and personal, freehold or less than freehold, freeholds of inheritance or not of inheritance, may become subject to another qualification, and be called estates upon condition, being such whose existence depends upon the happening or not happening of some uncertain event whereby the estate may be either originally created or enlarged or finally defeated. [CONDITION; MORTGAGE.]

2. Estates are either in possession or in expectancy. The former kind of estate requires no explanation here. The latter, involving some of the nicest and most abstruse learning in English law, are divided into estates in remainder and reversion, and by executory devise or bequest; and again, remainders are divided into estates in remainder vested or contingent. [REMAINDER; REVERSION.] An executory devise or bequest is such a limitation of a future estate or interest in lands or chattels as the law admits in the case of a will, though contrary to the rules of limitation in conveyances at common law. It is only an indulgence allowed to a man's last will and testament, where otherwise the words of the will would be void; for wherever a future interest is so limited by a will as to fall within the rules laid down for the limitation of contingent remainders, such an interest is not an executory devise, but a contingent remainder. [WILL.]

3. Estates may be enjoyed in four ways; in severalty, in joint tenancy, in coparcenary, and in common.

An estate in severalty is when one tenant holds it in his own right without any other person being joined with him.

An estate in joint tenancy is when an estate is granted to two or more persons at the same time, in which case the law construes them to be joint tenants unless the words of the grant expressly exclude such construction; they have unity of interest, of title, of time of vesting, and of possession, and upon the decease of one, his whole interest, unless disposed of by him in his lifetime, remains to the survivor or survivors.

An estate in coparcenary is when an estate of inheritance descends from the ancestor to two or more persons, who are called parceners, and amongst parceners there is no survivorship.

An estate in common is when two or more persons hold property, by distinct titles and for different interests, but by unity of possession.

All these three last-mentioned modes of joint and undivided possession may be put an end to by the parties interested, either by prescribed modes of conveyance or by partition. [PARTITION.]

Estates are also legal or equitable. It is a legal estate when the owner is in the actual seisin or possession, and also entitled to the beneficial interest himself or in trust for some other person. An equitable estate is when some other person, not the person who is the actual and legal owner, is entitled to the beneficial interest of the property of which that other is in possession. The power of the beneficial owner over his equitable estate is as complete as if he were possessed of the legal estate. [TRUST; EQUITY.]

ESTE, HOUSE OF, one of the oldest historical families of modern Europe, and the oldest among those which have retained sovereign power to the present time, the house of Savoy perhaps excepted. Some chronologists, such as Pigna, have endeavoured to trace back the genealogy of the house of Este to the fifth century of our æra, when we find the names of Atius, Aurelius, and Tibérius mentioned as princes of Este, Vicenza, and Feltre. But to pretend to ascertain the lineal succession of these princes down to the ninth century is a matter at least very dubious. The more sober and judicious Muratori, in his 'Antichità Estensi,' has traced the ancestry of the Este to the dukes and marquises who governed Tuscany as a great imperial fief under the Carlovingian emperors, and who were probably, like most other great Italian feudatories at that time, of Longobard origin. Some old chroniclers, such as Mario Equicola, in his 'History of Mantua,' state positively that they were Longobards, and related to the Longobard dukes of Spoleto. The succession, however, of these marquises or dukes, among whom are registered two of the name of Adalbert, in the ninth century, is not clearly ascertained until we come to another Adalbert, who is styled marquis, but of whom little is known, and who died about A.D. 917. He left, however, two sons, Guido and Lamberto, who were stripped of their fiefs by Hugo and Lotharius, kings of Italy. A son or nephew of either Guido or Lamberto, named Oberto, took the part of Berengarius II., who was elected king of Italy about A.D. 950; and this Oberto was possessed, either by inheritance or through the favour of Berengarius, of several fiefs in Tuscany and Lunigiana. Being afterwards dissatisfied with the conduct of Berengarius, he was one of the Italian nobles who repaired to Otho of Saxony to offer him the crown of Italy. Otho, on his exaltation, appointed Oberto comes sacri palatii, which was one of the first dignities of the kingdom, and gave him in marriage his daughter Alda. Oberto died about the year 972, leaving two sons, Adalbert and Oberto II., the latter of whom was lord of Lunigiana and of the county of Obertengo in Tuscany. Oberto took the part of Hardouin, marquis of Ivrea, against Henry of Bavaria, for the crown of Italy. Oberto died about 1014, and was succeeded by his son, Alberto Azzo I., who in his turn was succeeded by his son Alberto Azzo or Albertazzo II. This Albertazzo, besides his paternal fiefs of Lunigiana and Tuscany, inherited also from his uncle Ugo the fiefs of Este, Rovigo, and Casalmaggiore, in Lombardy. In the year 1045 he was appointed by the emperor Henry III. count and governor of Milan; and soon after he married Kunitza, or Cunegonda, of the great German house of Welf, and sister to Welf III., on whom the Emperor Henry had bestowed the duchy of Carinthia and the march of Verona. Welf III., dying without issue, his inheritance fell to his sister's eldest son by Albertazzo, who took the name of Welf IV. This Welf IV. was made duke of Bavaria about 1070, and from him the line of Brunswick and Hanover, known also by the name of Este-Guelphs, is descended.

Albertazzo having lost his German wife, married Garisenda, countess of Maine in France, by whom he had two sons, Folco and Hugo. To Folco he left his Italian estates, and Hugo inherited the French property of his mother, namely, the county of Maine, which he afterwards sold. Hugo married a daughter of Robert Guiscard, the conqueror of Naples, and died without issue. Muratori transcribes a diploma of the emperor Henry IV., dated A.D. 1077, confirming the possessions of the Italian fiefs to Hugo and Folco, sons of the marquis Azzo of Este. Folco after his father's death was sued by his half-brother Welf for a share of his paternal inheritance; but after a long contention, an arrangement was made by which Folco retained the greater part of the Italian estates, including the fief of Este. Folco died in 1135, and his son Obizzo succeeded him. Like his father, he assumed the title of marquis of Este, from the town of that name, by which his house was designated ever after. The town of Este, built near

the ruins of the antient Ateste, lies in the Venetian state, north of the Adige, in the province of Padua. The emperor Frederic Barbarossa, at a court held at Verona, A. D. 1184, bestowed upon Obizzo the investiture of the marquisates of Milan and Genoa, which were then merely nominal, as the two cities had become free; yet the emperors would not discontinue the prerogative of appointing the titular marquises of those former imperial jurisdictions.

In Obizzo's time the foundation of the dominion of the House of Este over Ferrara was first laid. The family of Adelardi had long been the popular leaders at Ferrara, and enjoyed the chief authority in that community. Marchesella, the last offspring of this family, was betrothed by her uncle and guardian Guglielmo on his death bed to one of the Torelli, a rival family. But the girl was carried away and compelled to marry Azzo of Este, the son of Obizzo, and from that time the Este were considered as citizens of Ferrara. 'A veil has been thrown over the whole transaction, which seems to imply that fraud or violence had been committed.' (Litta, *Famiglie celebri Italiane.*)

This Azzo, styled the Fifth, died about the end of the twelfth century, and was succeeded by his son Azzo VI., who was elected in 1208 by the citizens of Ferrara as vicar or lord of that city, with power to appoint his successor. 'This,' says Litta, 'was the first example of a free Italian city giving itself over to a lord, and the beginning of those numerous principalities into which Italy became divided.'

Aldobrandino succeeded his father Azzo VI. in 1212, and was himself succeeded by Azzo VII., called also Azzo Novello, who took part with the Pope against Frederic II.; for the Este were naturally of the Guelph party. He was mainly instrumental in the fall of the tyrant Eccelino: he favoured learning, patronized the Provençal troubadours who resorted to his court at Ferrara, and established schools in that city. He was succeeded by Rinaldo, and the latter by Obizzo in 1252. Obizzo was elected lord of Modena in 1288, and of Reggio in the following year, according to the prevailing fashion of the Italian cities at that period. These lordships of Ferrara, Modena, and Reggio, however, were not held by the Este in undisturbed possession, for they were repeatedly invaded and recovered during the frequent wars of the Italian states in the fourteenth century. While the family of Este were acquiring a princely dominion, they lost the original fief from which they derived their name. About 1293 the Paduans took possession of the town and territory of Este by conquest, and annexed it to their community. It afterwards, in 1405, passed into the hands of the Venetians. (Alessi, *Ricerche Istorico-Critiche delle Antichità di Este.*)

Nicholas, called 'the Lame,' one of the successors of Obizzo, was vicar of Ferrara from 1377 to 1389: he fought for the pope against Barnaba Visconti, duke of Milan. He was succeeded in 1389 by his brother Albert, and Albert by another Nicholas, who died in 1440, leaving two legitimate sons yet in their infancy, and several natural sons grown up, to one of whom, Lionel, he bequeathed his dominions. Lionel proved a good prince: he restored the university of Ferrara, and after nine years of a mild and liberal administration he died in 1450, leaving the government of the state to his brother Borso, who was illegitimate like himself. Borso was one of the most distinguished princes of his age. He was a patron of arts and letters, and was generous, enlightened, and just. He recalled his two legitimate brothers, Ercole and Sigismondo, from Naples, treated them with brotherly affection, and in order to secure the succession to them after his death, he abstained from marrying. In 1452 Borso received from the emperor Frederic III. the titles of duke of Modena and Reggio and count of Rovigo; and in 1471 pope Paul II. gave him the title of duke of Ferrara, upon which town the Roman see claimed a right of patronage. Borso died soon after, leaving a large and prosperous state to his brother Ercole. 'More fortunate than Lorenzo de' Medici, who lived in the same age, Borso had not to encounter the violence of parties and opinions; he ruled over a contented and submissive population, and while the conspiracies against Lorenzo were looked upon as acts of patriotism, those against Borso were considered as private plots, the result of personal envy and malice; so that when he had occasion in 1451, 1459, and 1469, to punish several conspirators with all the severity of the laws, he did not lose on that account the veneration of his subjects. He enjoyed a great reputation for uprightness, and his fame spread so far that he received presents from some Indian princes, who believed that he was king of Italy.' (Litta, *Famiglie celebri Italiane.*)

His successor Ercole I. was likewise a man of considerable talents and a patron of literature. He was also remarkable for that wary and cautious policy which has been stigmatized as peculiarly Italian, but which was in reality indispensable to the Italian princes in order to protect themselves from the overbearing violence of foreign invaders, after Ludovico Sforza through ambition committed the suicidal act of calling the French into Italy. Ercole checked the fury of Louis XII., who, after he had driven the Sforzas from Milan, was bent on exterminating all the other Italian princes. Ercole was fond of travelling: he visited the various Italian courts, and encouraged tournaments, festivals, and hunting parties. He gave the first theatrical entertainments exhibited at Ferrara, where the Menæchmi of Plautus was performed in 1486. His court was frequented by Bojardo, Collenuccio, Tibaldeo, Guarino of Verona, and other learned men of his time. He caused many Greek MSS. to be translated, and had a Hebrew press established at Ferrara in 1476.

Alfonso I., son of Ercole, succeeded him in 1505. He married the daughter of Pope Alexander VI. [BORGIA, LUCREZIA.] Alfonso had a long and troubled reign. He was attacked by Julius II. and the Venetians; he lost Modena and Reggio, and the Venetians also threatened Ferrara. The death of Julius afforded him some respite. Leo X. continued to withhold Reggio and Modena from him, and made also an attempt to surprise Ferrara. Alfonso displayed considerable abilities and great perseverance. He and his brother, Cardinal Ippolito, the patron of Ariosto, often took the field in person: their artillery was the best served in Europe; and they defeated the Venetians. After the death of Leo X., Alfonso, who had till then sided with the French, made his peace with Charles V., who by an imperial decree dated 21st April, 1531, confirmed the rights of the house of Este over Modena, Reggio, and Rubiera, upon the duke paying him 150,000 sequins; and thus Alfonso was restored to the possession of those states. Alfonso died in 1534 and was succeeded by Ercole II., and the latter by Alfonso II., who is unfavourably known by the misfortunes of Tasso, which however the poet brought upon himself. Litta is of opinion that Tasso was in love with Eleonora the duke's sister, and that her sister Lucrezia was in love with him. 'In 1575 Tasso was sent away from Ferrara, his papers were seized, and among them were found poems with such images and descriptions as ought never to have been written.' Tasso was subsequently confined to the madhouse of St Anna, from which he was liberated after seven years, by the intercession of Vincenzo Gonzaga, prince of Mantua, who came to Ferrara for that purpose. [TASSO.] Alfonso II. dying in October 1597, without issue, Pope Clement VIII. immediately sent Cardinal Aldobrandino with troops to take possession of Ferrara as having devolved to the see of Rome, which had first invested Borso with the title of Duke. Cesare d'Este, Alfonso's cousin and heir, entrusted Lucrezia, Alfonso's sister, with full power to negotiate. Lucrezia, who had hated the Marquis of Montecchio, son of Alfonso I. and father to Cesare, on account of the share he had taken in the transactions of 1775 relative to Tasso, disliked Cesare also. Cardinal Aldobrandino having offered her the title and revenues of Duchess of Bertinoro in the Romagna, she signed a hasty convention, by which she gave up, in the name of the house of Este, Ferrara, Comacchio, and their dependencies, to the see of Rome. Cesare transferred his court to Modena, and Lucrezia died at Ferrara a few days after the entrance of the Papal troops, in February, 1598. The city of Ferrara, which, under the house of Este, had a population of 60,000 inhabitants gradually became reduced to 20,000.

Cesare, duke of Modena and Reggio, died in 1628. His son Alfonso III., who had remained as hostage at Ferrara, had shown in his youth marks of a violent disposition. In 1619 he caused Ercole Pepoli to be assassinated at Ferrara. Stung by remorse, he abdicated the ducal crown soon after his father's death, and became a Franciscan monk. He distinguished himself as a zealous preacher, and founded several convents. 'But,' says Litta, 'he could not totally change his nature. He was still a lion under the coarse tunic and hood. He was treated by the other monks with all the deference due to his rank, but was closely watched to prevent his doing mischief. He died in 1644, in a convent in the mountains of Garfagnana, which he had founded.' His

son Francis I. was not much better than his father. He affected a great zeal for religion, had his food scrupulously weighed on fast days, and he sentenced a relative of Marshal Gassion to be shot for want of proper respect while at church. He first separated the Jews from the rest of the population at Modena in 1630, and confined them to the Ghetto. He began the magnificent ducal palace at Modena as well as the country residence and gardens at Sassuolo. His successor, Alfonso IV., received in 1660 of the emperor Leopold the investiture of the principality of Correggio, which he had previously purchased. Alfonso loved the fine arts, and he was the founder of the Este gallery of paintings. He left at his death a son two years old, who was afterwards duke by the name of Francis II. During his minority his mother, Laura Martinozzi, Cardinal Mazarin's niece, held the government. She collected together all the bad characters in her dominions, and delivered them over to the Venetians, who employed them in the war of Candia against the Turks. Francis II. founded the university of Modena as well as the splendid library called Estense, of which Zaccaria, Muratori, and Tiraboschi were successively librarians. Francis II. dying in 1694 without issue, was succeeded by his uncle, Cardinal Rinaldo, who, after resigning his hat, married a daughter of the Duke of Brunswick Lunenburg, and sister-in-law to the emperor Joseph I. By this marriage the two branches of Este and Brunswick, which had been separated since 1070, became again connected. During the war of the Spanish succession, the Duke Rinaldo, notwithstanding his professed neutrality, was obliged by the French to quit Modena and to take shelter at Rome. The victorious Austrians, commanded by Prince Eugene of Savoy, restored him to his dominions, where he resided quietly till 1733, when the war for the succession to the crown of Poland, in which Italy had no concern whatever, but for which Italy was as usual devastated by the belligerents, obliged Rinaldo again to leave his territories, which became the theatre of war between the French and Piedmontese on one side, and the Austrians on the other. In 1736 Rinaldo returned to Modena. His repeated misfortunes affected and perhaps improved his disposition: he became serious and economical after having been inclined to pomp and magnificence. He enlarged his dominions by the purchase of the duchy of Mirandola and the county of Bagnolo. Rinaldo was succeeded in 1537 by his son Francis III., who was serving in Hungary against the Turks at the time. During the war of the Austrian succession he took part for the house of Bourbon, and commanded the Spanish armies in Italy. The peace of Aix la-Chapelle restored him to the quiet possession of his dominions. In 1754 Duke Francis was appointed by Maria Theresa governor of Lombardy during the minority of her son the Archduke Ferdinand, who was betrothed to the duke's grand-daughter Beatrice d'Este, a child then four years old. In 1771 Francis gave up his trust to the Archduke Ferdinand, but continued to reside in Lombardy, and died at Varese in 1780. His son Ercole Rinaldo, the father of Beatrice, succeeded him as duke of Modena. His administration was peaceful and economical. He was ever watchful against the temporal interference of the court of Rome in his dominions; and he was equally averse to the remains of feudality which still lingered in his states. When the French entered Italy in 1796, the duke made a convention with Bonaparte, paid a heavy contribution, gave up some valuable paintings, but not trusting to the faith of the conqueror, he withdrew to Venice with his treasures, leaving a council of regency at Modena. An insurrection excited at Reggio by some Corsican soldiers in the French service afforded a pretext to Bonaparte to violate the convention, and to occupy the states of Modena, which were afterwards annexed to the Cisalpine republic. (Botta, *Storia d'Italia;* Paradisi, *Lettere a Carlo Botta.*) When in the following year the French occupied Venice, the duke had escaped to Trieste, but a deposit of 200,000 sequins which he had left behind was seized. Ercole Rinaldo died in the Austrian States in 1803. His daughter Maria Beatrice, the last offspring of the house of Este, lost her husband, the Archduke Ferdinand of Austria, in the year 1800, and their eldest son, Francis IV., was restored by the peace of Paris in 1814 to the dominions of his maternal ancestors, namely, the duchy of Modena, Reggio, and their dependencies, including the district of Garfagnana, on the borders of Lucca. By the death of his mother he has also inherited the duchy of Massa and Carrara, of which his grandmother, of the house of Cibo Malaspina, was the heiress. [CARRARA; MODENA.]

ESTELLA. [NAVARRE.]

ESTHER, The Book of, a canonical and historical book of the Old Testament, placed after that of Nehemiah, but coming chronologically between the 6th and 7th chapters of Ezra. It is thus denominated from the Persian name of the Jewish woman, Hadassah, whose history it relates. She was an orphan niece and adopted daughter of Mordecai, from a Benjamite family of the Babylonian captives of Nebuchadnezzar (ii. 5-7). The scene of the narration is in the city Shusan, or Susa, now Sus (not Shuster, as stated by Dr. Adam Clarke—see *Trans. Geog. Soc.*, vol. iii.), which, throughout the book, is in English mistranslated Shushan the *palace*, though, in the Septuagint version, it is rightly ἐν Σούσοις τῇ πόλει, that is, 'in Susa the city.' Augustin, Epiphanius, and Isidore supposed the author to have been Ezra. Eusebius assigns a later date. Some writers have attributed it to the high priest Joachim; others believe it to have been composed by the Jewish synagogue, to whom Esther and Mordecai wrote (ix. 20-29); but by the greater number Mordecai himself is thought to be the author, and Elias Levita, in his Mass. Hamum, asserts this to be a fact unquestionable. The original, according to Dr. Adam Clarke, was probably written in the language of antient Persia. St. Hieronymus and several other fathers regarded this book as wholly uncanonical, because the name of God or religion is not once mentioned or alluded to, and they have been followed by some modern writers, as Cajetan and De Lyra; but the Council of Trent pronounced it to be wholly canonical; and while the Protestant churches admit into the canon only what is found in the Hebrew copies, that is, as far as to the end of the third verse of chap. x., the Greek and Roman churches use as canonical the Greek version and Latin Vulgate, which contain each ten more verses of chap. x. and six additional chapters. By the Jews the book has been always considered as one of the most precious of their sacred scriptures, and as a perfectly authentic history of real events which took place about B.C. 519. They call it מגילה, Megilah, that is, *The* Volume, and hold it in the highest estimation; believing that whatever destruction may happen to the other scriptures, Esther and the Pentateuch will always be preserved by a particular Providence. Copies exist in the Hebrew, Syriac, Chaldaic, Greek, and Latin; each of which widely differs from the others, and all, especially the Greek and Chaldaic, are greatly different from the Hebrew. The Chaldaic text contains five times more than the Hebrew, and a notice of the various readings would fill a large volume. (See the London Polyglot Bible.) Commentators differ much in determining to which of the Persian and Median kings belongs the name of Ahasuerus, whose kingdom extended from India to Ethiopia over 127 provinces (i. 1). Some suppose him to be Darius Hystaspes. Scaliger and Jahn say Xerxes. By Capellus he is identified with Ochus, and by Archbishop Usher with Darius the son of Hystaspes. Dean Prideaux and Dr. Adam Clarke with greater probability take him to be Artaxerxes, who received the cognomen of Longimanus, or Longhanded. The following is a brief abstract of the book of Esther in the words of the text. This monarch (chap. i.), after having entertained all his nobles and princes with sumptuous festivity during more than six months, gave a great feast in his palace garden to all the men of Susa, great and small, while the women were separately feasted by the queen in the royal house. To the men royal wine was supplied in abundance, and the drinking was according to every man's pleasure; when, the king being, on the seventh day, merry with wine, sent his seven chamberlains with orders to bring the queen to exhibit herself (the Talmud says naked) before his guests; but Vashti (which in Persian means the beautifully fair) refusing to come, he was very wroth, and his anger burned within him. Ahasuerus however punished her by degradation and banishment, and by his royal mandate letters were despatched to the people of each province, decreeing that every man bear rule in his own house. To furnish the royal harem with the greatest means of choice there was made throughout the empire (ch. ii.) a general levy of the fairest virgins, and Esther, the beautiful young Jewess, being preferred by Hege, the keeper of the king's women, before all others of the numerous assemblage, she succeeded to the place of the banished queen Vashti. The twelve months' cosmetical purification of the maidens previous to their admission to the king (ver. 12) was required, says Dr. Clarke,

'to show if they were with child, that the monarch might not be imposed on by fathering a spurious offspring and because many having been brought up in low life and fed on coarse, strong, and indigestible food, they had a copious and strongly odorous perspiration, which was far from pleasant.' Esther's foster father, Mordecai the Jew (chap. ii), having refused to do reverence to Haman, the chief minister and favourite of Ahasuerus, he, with all the other Jews from Babylon, then dispersed throughout the Persian empire, were by Haman devoted to destruction, and the royal mandate being accordingly issued 'to destroy, to kill, and to cause to perish all Jews, young and old, little children and women, in one day, and to take the spoil of them for a prey' (ver. 13), the king and Haman sat down to drink; but the fickle tyrant, influenced in the mean time by the pathetic entreaties of Esther, and by the recollection that Mordecai had discovered a conspiracy against his life, was induced to hang his favourite Haman on a gallows thirty yards high, which that minister had prepared for Mordecai. He then promoted Mordecai to the highest honours in the empire; and still yielding to the influence of the fair Jewess and of Mordecai, he hastily issued orders empowering all the Jews 'to destroy, to slay, and to cause to perish all the people that would assault them, both little ones and women, in one day, throughout all the provinces of King Ahasuerus, and to take the spoil of them for a prey' (viii. 11 [illegible]); so that 'the Jews smote all their enemies with the sword with slaughter and destruction, and did what they would unto those that hated them' (ch. ix. 5). By the special request of Esther the ten sons of Haman were hanged on the gallows, and in the city of Susa the Jews massacred eight hundred of the king's Persian subjects, and in the provinces seventy-five thousand (ix. 12, 15, 16). This signal revenge of Haman's intended [illegible] of the Jews in Persia has ever since been commemorated (ix. 2[illegible]) on the 14th and 15th days of the month Adar, in the Jewish 'Feast of Purim,' that is, in Persian, *the lots*, with reference to those which on this occasion were cast before Haman (ch. iii. 7; ix. 24); and the lower class of Jews, like the similar class of Irish with respect to St. Patrick's day, [illegible] it a [illegible] on these Days of Purim to be drunk as a [illegible] duty. It is here worthy of remark that the word which in the authorized version is repeatedly translated *gallows* should properly be *cross* or *tree*. Hence it was that in the first ages of Christianity the Jews, when celebrating this feast of Purim, were accused of deriding the Christian crucifixion, in abusing and setting fire to an effigy of Haman affixed to a lofty wooden *cross*, a custom which, on this account, was abolished in the Roman empire by the decrees of Justinian and Theodosius. It has been observed that apparently the only good moral sentiment derivable from the statements of this book, the inspired authority of which was doubted by several early fathers, is a detestation of the sensuality and cruelty of such royal despots as the king Ahasuerus. (Dr. Prideaux's *Connection of the Old and New Test.*; Horne's *Introduction to the Bible*; *Commentaries* by Dr. A. Clarke and others; *Lectures on the Book of Esther*, by Dr. Lawson, 1809; *Eclect. Review*, vol. iii.; Calmet's *Dict. of the Bible*; Dr. A. Clarke's *Succession of Sacred Literature*.)

ESTHONIA, or REVAL, a Russian government or province constituting one of the five provinces included in the grand subdivision of Russia in Europe which is called the Baltic (East Sea) Provinces. It is not known by this name among the native inhabitants, but by that of 'Wiro[illegible]a' border land, or 'Meie Maa,' our land. The boundaries of Esthonia are, on the north, the gulf of Finland; on the east, the government of St. Petersburg; on the south, lake Peipus and the government of Livonia; and on the west, the Baltic. It was subjugated by the Danes in 1220, and in 1346 sold by them to the Teutonic knights, whose grand master, the first duke of Livonia and Esthonia, acknowledged the king of Poland as lord paramount in 1561. After being an object of continued contest between the Russians, Poles, and Swedes, it became at length a province of Sweden in 1660. It was wrested from the Swedish crown by Peter the Great in 1710, and was ceded finally to Russia under the treaty of Nystadt in 1721. Including the islands of Dagoe, Worms, Wrangel, Nargen, the two Roogs, Odensholm, Nuckoe, Eckholm, Heft, Kranholm, and fifty-nine smaller islands, the total area of this government is 6804 square miles, of which one thirty-fifth part belongs to the seventy islands. The extent of coast is about 260 versts, or 173 miles, and the population, which was 196,285 in 1783, 227,001 in 1819, and 229,398 in 1828, is now estimated at about 240,000. The general character of the surface is level, occasionally varied by isolated hills and eminences, which the people of the country denominate mountains. The northern coast, from Reval or Revel to Narva, is several fathoms higher than the Baltic, and strewn with masses of granite; the western coast is lower, but both are edged for some miles inland by a deep bed of sand. The soil of the interior districts of Esthonia, which are the most fertile, is a mixture of loam, sand, and clay; in all parts are large swamps, many of which are impassable, except when hardened by the frosts of winter. The proportion of the cultivated to the uncultivated and wooded soil is estimated by Bienenstamm at one part only in three.

Esthonia contains 228 small lakes, besides the northern end of lake Peipus and the left bank of the Narova, which flows out of the Peipus into the Baltic and divides the government from that of St. Petersburg. This province has no streams but rivulets and brooks, some of which flow under ground, and occasionally contain pearl muscles. There are sulphurous and saline springs.

Though the temperature is moderate when compared with that of the adjacent provinces, the winter is of long duration, and winds and fogs prevail throughout the year.

The soil, though deficient in fertility, yields more than sufficient for the maintenance of the population. Agriculture is the principal branch of industry, and about one fifth of the whole surface is under the plough. The chief crops are barley and oats; some wheat, Indian corn, hemp, flax, hops, and tobacco are also raised. The whole produce of grain is estimated at [illegible]00,000 quarters, which being more than is consumed, the surplus, about 180,000, is applied to making brandy. The Weissenstein districts in the south-east produce much hemp and flax. As the harvest season is attended by heavy rains, the farmers have subterranean [illegible] in most parts, into which the harvest grain is carried for the purpose of being dried. Esthonia has large meadows, and produces abundance of hay; it has likewise good grazing grounds. Vegetables are of universal growth, but little attention is given to fruits. The woods and forests, composed of the fir, pine, elm, birch, larch, and beech, occasionally intermixed with the oak, alder, linden, crab-apple, &c., spread over an area of about 3300 square miles; they are densest in the eastern districts of Wesenberg and Weissenstein.

Next to agriculture, the rearing of cattle is the most important branch of rural industry. The native horse is small in stature, but strong and enduring, and the breeds called the Reval Klepper and Doppelklepper are in much esteem. The horned cattle are small, but afford much milk, and large droves of oxen from the Ukraine are fattened for the St. Petersburg market. Much has been done to improve the breed of sheep, which are of the German white or blackish species. Goats, swine, and poultry are reared in great numbers. The wild animals are the bear, wolf, fox, badger, marten, and squirrel; a few elks are to be met with in the Wesenberg forests. The fisheries along the coast and in lake Peipus are very productive. The mineral products are stone for building, potter's clay, and gypsum; there is abundance of peat.

The majority of the inhabitants are Esthonians; they are of Finnish descent, of diminutive stature, and have light-coloured hair in general, blue eyes, a small flat nose, and flattened countenance. They were sunk until late years in abject slavery. The landholders are universally of German or Danish extraction, and constitute the aristocracy of the country, and there are some Russians and a few Swedes and Finlanders intermixed with them. In 1819, when the population amounted to 2[illegible]7,001, it comprised 210,240 Esthonians, and 88[illegible]6 Germans. In 1830, when it amounted to 228,000, the number of births was 10,881, and deaths 70[illegible]. In 1828, when it was 229,398, the towns contained 21,[illegible]3, and the rural districts 20[illegible],33[illegible]; in that year also the number of males was 100,363, and females 104,972.

Esthonia contains [illegible]63 estates, which, with the exception of eight, the property of the crown, and [illegible] belonging to the clergy, are in the hands of the nobility. The peasants' families are estimated at 30,000. The Lutheran is the predominant religion of the province; even the Russo-Greeks

have not more than eight or ten churches in it. The superintendence of all ecclesiastical affairs in the Lutheran church is vested in the provincial consistory at Reval, and the number of parishes is 134. The department of education, which includes a gymnasium at Reval and about fifty other schools, with about 1500 pupils only, is under the control of the university of Dorpat. In 1831 the proportion of pupils to the whole population was not more than one in every 118 individuals.

The manufactures of Esthonia are extremely limited: the peasantry are clothed not only with linen but with coarse woollen cloth woven in their own houses. The only establishments of any importance are in Reval, where hats, leather, powder and starch, vinegar and some iron-ware are made. In 1830 indeed there were but three large manufactories in the whole province, and 297 workmen attached to them. Vessels are constructed in the capital and in the islands; and brandy is made on many estates as well as in the towns, and even by the farmers themselves, the distilleries of this spirit amount to nearly 400.

Reval is the emporium of trade, but for want of water communication it is not of any great extent. The exports consist of grain, brandy, salt-fish, skins and hides, butter, tallow, smoked herrings, and salmon and salt.

Though public affairs are administered on the same footing as in the other Russian governments, the country retains some vestiges of its antient constitution among which are a provincial college or council, an inferior tribunal of justice, a consistory, and the right of making brandy without a license from the government.

Esthonia is divided into four circles, viz. North-west, Reval or Revel, formerly Harrien, chief town Reval (13,000 inh.), with the island of Nargen (—0), Wrangel (600), Rokshaer, Malus Rumo, in the Roggs, and Odensholm; South-west, Hapsal, formerly Wiek, chief town Hapsal (1470), with the islands of Dagoe (10,000), Worm (1100), and Nukoe (— 0); South-east, Weissenstein, formerly Jerven, chief town Weissenstein (600); North-east, Wesenberg, chief town Wesenberg (1100), with the island of Eckholm, Heft, and Kumbilm, besides the districts of Kunda, chief town Kunda (400), and of Lad (— 24 inhabitants).

ESTIENNE. [Stephens.]

ESTOPPEL, an impediment or bar to a right of action arising from a man's own act, or the act of some person through whom he claims. There are three kinds of estoppel: 1. *By matter of record*, as letters patent, pleading, &c. Thus, in an action against a patentee by his assignee, the patentee is estopped from pleading that the patent is invalid.

2. *By matter of writing*, as by deed &c.: parties and privies are estopped from alleging any thing contrary to the deed. It is frequently laid down that an indenture is more effectual in working an estoppel than a deed poll [Deed]; but from the statement in the book from which this position is derived (*Shep. Touch.*, 53), it does not appear that the fact is so, inasmuch as it is there admitted that if both parties sign and seal a deed poll, they are equally estopped as if the deed had been indented.

3. *By matter in pais* (in the country), *i.e.*, transactions between the parties not evidenced by record or writing, as livery, entry, acceptance of rent, &c. Thus after acceptance of rent a landlord cannot treat his lessee as a trespasser. The rules which govern the application of this doctrine are laid down 1 *Inst.* 352 b.

ESTOVERS. Spelman in his Law Glossary says that this word is derived from the French *estoffer*, and that from *estoffer*, which is to supply with necessaries, and is of the same signification as the Saxon word *bote*. In legal phraseology it is the liberty which the owner of an estate for life, as well as a tenant for years (in the absence of any stipulation to the contrary), possesses of taking a reasonable and necessary supply of wood from the estate for the use or furniture of his house or farm, and this according to the use to which it was applied, was either called house-bote, plough-bote, cart-bote, or hedge-bote. *House-bote* is a sufficient allowance of wood to build or repair the house or to burn in it, which latter is also sometimes called *fire-bote*; *plough-bote* or *cart-bote* is the wood employed in the making or repairing all instruments of husbandry, as carts and ploughs, harrows, rakes, &c.; *hedge-bote* or *hay-bote* for repairing hedges, fences, pales, stiles, and gates, and to secure enclosures.

If a tenant takes more than is necessary for these purposes he may be punished for waste, as if he cuts down wood to burn when he has sufficient dead wood upon the estate, and a tenant, although he may cut down and take sufficient wood to repair pales and fences, he around them, still he cannot do so to make new ones.

A rector may also cut down timber for the repair of his parsonage house, or the chancel, or even for any old pews which belong to the rectory; and, like other tenants for life, he is entitled to estovers for repairing the barns and outhouses belonging to the parsonage.

Bracton uses the word estovers in a different sense, viz., as the sustenance, which a man committed for a felony is to have out of his lands and goods for himself and family during his imprisonment; it also occurs in the statute 6 Edw. I. c. 3, as an allowance of meat or cloth; but the more common and usual signification by which it is known to lawyers has been already stated. (Woodfall, *Landl. and Tenant*; Comyn.)

ESTRAY, any valuable tame animals found wandering at large within any manor or lordship, and whose owner is unknown. Having been impounded, and proclaimed in the church and the two nearest market-towns on a market-day, they become, if not claimed in a year and a day, the absolute property of the king, as lord paramount of the soil, though generally the lord of the manor or liberty is the special grantee of the crown. Animals upon which the law sets no value, as a dog or a cat, or such as are of a wild nature, as a fox or a wolf, cannot be taken as estrays. Swans may be taken as estrays, but no other fowl. The king or the lord does not acquire the absolute property in the estray until the full expiration of the year and a day which runs from the first proclamation, and not from the seizure; therefore if it escape before the time to another manor he cannot reclaim it.

The king or the lord is bound to take care of the estray, and find it in provision. He must not use it, but is liable to an action for so doing, though he may milk a cow or the like, for that tends to the preservation of the animal and is necessary. The owner on the other hand, if he claim within the time allowed, must pay the charges of finding, keeping, and proclaiming the estray.

It may be observed that if any person not being entitled to estrays finds and takes care of another's property, the owner may recover it or its value without being obliged to pay for the expenses incurred in keeping it.

ESTREAT, from the Latin word *extractum*, is a true copy or note on the rolls of a court of some original writing or record, especially of fines and amerciaments which are to be levied by a bailiff or other officer. In all cases of felony or misdemeanor where persons bound by recognizance either to appear themselves or for the attendance of any witnesses at trials of felonies or misdemeanors neglect to do so, the recognizance becomes forfeited; an officer of the court which sat at the end of the assize or session, prepares a list of the defaulters, and when the same has been approved by the judge presiding, the fine or forfeiture mentioned in the recognizance is said to be estreated, or certified into the Exchequer, and process is awarded for its recovery.

These fines when levied are paid into the Treasury, or the lords of the Treasury may, if they think fit, previously to the issuing of the process, stay the execution and remit the fine.

The barons of the Exchequer were also empowered by a standing writ of privy seal to discharge, mitigate, or compound forfeitures estreated into the Exchequer from other courts; and by the 4th Geo. III., cap. 10, they were also authorized, upon affidavit and petition, to discharge estreated recognizances and forfeitures except those incurred before justices of the peace. (*Term Report*; Burn, *Justice*.)

The various acts of parliament which now regulate the mode in which fines are to be levied upon estreated recognizances, &c., are the 4th Geo. IV., cap. 37, with regard to those before justices of the peace, the 7th Geo. IV., cap. 64, before judges of assize, recorders, &c., and the 3rd and 4th Wm. IV., cap. 99, which relates to such only as are forfeited in the Houses of Lords and Commons.

ESTRELLA. [Portugal.]

ESTREMADURA, a province of Spain, bounded on the north by the province of Salamanca, on the east by New Castile, on the south by Andalusia, and on the west by

Portugal. Its length from [illegible] is about 180 English miles, and its average [illegible] miles from east to west. Its area is reckoned at about 14,600 English square miles. Two large rivers, the Tagus and the Guadiana, both coming [illegible] across the province from east to west, and their [illegible] form the two natural divisions of the prov[illegible] Tagus being Northern Estremadura, called al[illegible] Estremadura, and that of the Guad[illegible] forming the [illegible] part, which is called Baja, or [illegible] Estremadura. A range of mountains, which is a conti[illegible] of the montañas de Toledo, in New Castile, and which, under the various names of Sierra de Guadelupe (5000 feet), Sierra Marchal, and Sierra de San Pedro, crosses Estremadura in a south-west and west direction, and then joins itself to the Sierra del Portalegre, on the frontiers of Portugal, forms the division between the waters which flow into the Guadiana and those which run into the Tagus. To the north the basin of the Tagus is bounded by another and still loftier ridge, the Sierra de Gredos, a continuation of the mountains of Avila, in Old Castile, which runs westward under the names of Sierra de Francia and Sierra da Gata, along the boundaries between Estremadura and Salamanca, and afterwards entering Portugal joins the Sierra d'Estrella in the neighbourhood of Alfaiates and Penamacor. From this northern ridge several considerable streams, such as the Alagon and the Tietar, flow southwards into the Tagus. The Alagon rises in the mountains of Las Batuecas, waters the fine plain of Plasencia, passes by Coria, and enters the Tagus above Alcantara. Its whole course is about 70 miles. Of the streams which enter the Tagus, on the opposite or southern bank, the principal one is the Salor, which rises in the Sierra de San Pedro, and enters the Tagus below Alcantara. The principal towns of the northern division of Estremadura are: Plasencia, a bishop's see, with 6760 inhabitants, and a fine aqueduct: it lies in the midst of one of the finest and best cultivated territories in all Estremadura: the convent of S. Justo, in which Charles V. ended his days, lies at the foot of the Sierra de Gredos, to the east of Plasencia: Caceres, south of the Tagus, with 10,000 inhabitants, the residence of the audiencia, or upper judicial court of the province: Alcantara on the Tagus, with 3300; its handsome bridge built by Trajan was partly destroyed during the Peninsular war: Valencia de Alcantara, near the frontiers of Portugal and at the foot of the Sierra Fria, with 4700 inhabitants: Truxillo, near the borders of Castile, the birth-place of the Pizarros, with 4600 inhabitants: Coria, north of the Tagus and west of Plasencia, with 2500.

The basin of the Guadiana, or southern division of Estremadura, is bounded to the south by a continuation of the Sierra Morena, which, under the name of Sierra de Guadalcanal and Sierra de Monasterio, divides the waters of the Guadiana from those of the Guadalquivir, running westwards along the borders of the provinces of Estremadura and Seville, and then entering that part of Alentejo which is east of the Guadiana. This branch of the Sierra Morena is comparatively low, few if any summits reaching 2000 feet above the sea. The banks of the Guadiana, especially below Badajoz, are low, flat, and unhealthy. The finest districts of this part of Estremadura are those of Llerena, near the foot of the Sierra Morena, of Xeres, and la Serena. Badajoz is the capital of all Estremadura, and the residence of the captain-general. [BADAJOZ.] The other towns of the southern division are: Merida, the antient Emerita Augusta, with about 5000 inhabitants, a handsome Roman [illegible] the Guadiana, restored by Philip II., a triumphal [illegible] remains of a theatre, of a naumachia, and circus, and numerous other traces of its former splendour; Xeres de los Caballeros, south of Badajoz, with 9300 inhabitants; Alburquerque, north of Badajoz, and near the frontiers of Portugal, with 6700 inhabitants; Olivenza, a fortified place formerly belonging to Portugal, with 2000 inhabitants; Llerena, near the foot of the Sierra Morena, with 6500; Zafra, an industrious place, with tanneries, and manufactures of hats, &c., 7500 inhabitants; Medellin, on the south bank of the Guadiana, the birth-place of Cortes, with 1700 inhabitants.

[illegible] whole population of Estremadura is vaguely reckoned at [illegible]50,000 inhabitants, divided among seven towns, 212 villas or boroughs, and 121 aldeas or villages, mostly thinly inhabited. The ecclesiastical division consists of three bishoprics, namely, Badajoz, Plasencia, and Coria, and 415 parishes. There were also 170 convents previous to the late suppression. Estremadura is one of the least populous provinces of Spain; its depopulation dates from the expulsion of the Moors, and the subsequent establishment of the Mesta, or administration of the flocks of migrating sheep which took possession of the vast tracts which had remained abandoned. About four millions of sheep come to graze, during winter, from the other provinces on the open spontaneous pastures of Estremadura. Other tracts are covered with underwood and wild odoriferous herbs. There are also forests of oak, beech, chestnut, and pine trees, where numerous herds of swine feed: the flesh of these animals forms a considerable article of commerce with other provinces of Spain. Game of every sort is plentiful. The cultivated parts produce some wheat, oats, Indian corn, flax, hemp, and the vine, olive, mulberry, and lemon trees. Excellent honey and wax are also gathered. Many ruined and deserted villages are met with over the country, with traces of former cultivation and of a population which has disappeared.

The Estremeños, or inhabitants of Estremadura, are reckoned the most grave and taciturn of all the people of Spain. Living in a remote inland province, with few means of communication with the rest of the world, they have, generally speaking, no notion of the luxuries or even comforts of other countries, and therefore do not exert themselves to acquire them. When they have an object in view, they are capable of great exertion and perseverance: they are frank, sincere, and honourable, and robust of body, and disposed to military service, especially in the cavalry. Some of the boldest adventurers who discovered and conquered America were natives of Estremadura. The great number of emigrants who left this province for the New World during the sixteenth century has been considered, but with little reason, as one of the causes of the depopulation of the country. The name of Estremadura is said to be derived from the Latin 'extrema ora,' it being the furthest and latest conquest of Alonso IX. over the Moors in 1228.

The high post-road from Madrid to Lisbon crosses Estremadura, and is kept in good repair. The other roads are bad, and impassable for carriages in the rainy season. The posadas or inns on the roads are among the worst in Spain; provisions are scarce, and the markets few and ill supplied. On the side of Portugal, the frontier north of the Tagus between Estremadura and Beira is marked by a ridge of hills, an offset of the Sierra de Gata, which extends from Penamacor, a town within the Portuguese frontier, southwards to the Tagus, a few miles west of the bridge of Alcantara. A road leads from Plasencia across these hills by Zarza and Zibreira to Castello Branco in Portugal. South of the Tagus, the western boundary of Estremadura is much further advanced towards the west; beginning near Montalvaõ, about 35 miles west of Alcantara, it continues southwards, passing a little to the east of Castello de Vide and Campo Mayor, which are in Alentejo, down to the Guadiana, a few miles below Badajoz. From thence, for about 30 miles southwards, the Guadiana serves as a boundary, after which an ill-defined tortuous line, of about 50 miles more, first south and then south-east, marks the limits between Estremadura and Alentejo, to the foot of the Sierra Morena, which forms the north boundary of Andalusia.

Estremadura has mines of copper, lead, and iron; and one of silver at Lagrosan, near Alcocer. The manufactures are few, consisting chiefly of leather and hats at Badajoz, Zafra, and Caceres. The annual net income derived from the land belonging to lay proprietors is estimated by Miñano at 55 millions of reales vellon, or little more than half a million sterling, and that belonging to the clergy both regular and secular, before the late suppression, at 21 millions and a half, or about 210,000*l.* sterling. (Miñano, *Diccionario Geografico*, article 'Estremadura;' and also 'Statistical Tables' annexed to the art. 'España;' Ancillon: Bowles.)

ESTREMADURA, a province of Portugal, is bounded on the north by Beira, on the east partly by Beira and partly by Alentejo, on the south by Alentejo, and on the west by the Atlantic Ocean. The length of the province from north to south, from the village of Lavaos, which lies on the sea-coast south of the mouth of the Mondego, to the borders of Alentejo near Melides, south of the lagoon of Setubal, is about 140 miles, and its greatest breadth from east to west is about 85 miles. The ridge of the Estrella, which crosses part of Beira from east

to west, sends off a branch to the south-west, which enters Estremadura west of Pombal, and runs obliquely through the length of the province under the various names of Serra de Louzaõ, Serra de Alberdos, Monte Junto, and Serra de Baragueda. The Serra de Baragueda stretches to near Torres Vedras, and there meets at an oblique angle the ridge which spreads from east to west from the Tagus to the sea across the peninsula in which Lisbon is situated. This latter ridge, which is separated from the former by a narrow but deep ravine extending from Torres Vedras towards Sobral, furnished Lord Wellington in 1810 with a valuable position of defence against the French invading army under Marshal Massena. The line of hills extends from the mouth of the Zizandre, west of Torres Vedras, to the town of Alhandra on the Tagus, a distance of about thirty miles. The village of Sobral lies in front of the centre of the line.

The central ridge or continuation of the Estrella chain already mentioned divides the waters which flow into the Tagus from those streams which run direct into the ocean. Among the tributaries to the Tagus, the most considerable are—1 The Zezere, a rapid stream which has its source in the mountains of Guarda in Upper Beira, enters Estremadura near Pedrogaõ, and running southwards receives the Narvaõ from Thomar, and then enters the Tagus at Punhete below Abrantes. 2. The Azembuja, called also Rio Mayor, which rises north of the town of Rio Mayor, and flows in a tortuous course, passing near Cartaxo, and at the foot of the hill of Santarem, and enters the Tagus above Villa Franca. The streams which flow from the north-west slope of the ridge into the ocean are—1. The Lis, which rises near Alcanhede, flows by Batalha, receives the Lena near Leiria, and enters the sea south of Cape Paredes. 2. The Alcoa, which rises south of the Lis, is joined by the Baça (the two together giving the name to the town of Alcobaça), and after a short course enters the sea. 3. The Arnoya, a small stream which rises in the group of Monte Junto, passes by Obidos and Rolixa, where the first engagement between the English and the French in the Peninsula took place on the 17th of August, 1808, and then enters the lake or lagoon of Obidos which communicates with the sea. 4 Farther south towards Torres Vedras is the river Marceira, which passes by Vimieiro, and after a short course enters the sea south of Peniche Point. 5. The stream Zizandre rises below Sobral, flows through the ravine above mentioned between the Serra de Baragueda and the ridge of Torres Vedras, and enters the sea at the west extremity of the lines.

That part of Estremadura which lies north-west of the central ridge and between it and the sea is mostly flat and sandy towards the coast, and either barren or covered with forests of pines. Leiria lies in a fine valley on the Lis, at the foot of the hills which are covered with olive plantations. The country which lies to the south-east of the ridge sloping towards the Tagus is finer and better cultivated, especially the plains about Thomar and Santarem, which are very fertile, and abound with olive and other fruit-trees, and fine pasture grounds. The country about Cartaxo produces much wine. But the finest part of the whole province is that which lies to the south of the lines of Torres Vedras towards Lisbon. A second range of hills rises behind the first, extending from Mafra and Ericeira on the sea, to near Povoa on the Tagus, the high summit called Cabeça de Montachique standing in the centre; and south of these are the hills of Cintra, Queluz, Bellas, &c., which command the city of Lisbon and the banks of the Tagus down to Fort St. Julian. Between these various ranges are delightful valleys, covered with villages, convents, and quintas or country seats, and with gardens, orchards, and vineyards, remarkably well cultivated. This pleasing exception to the generally slovenly state of agriculture over the greater part of Portugal was attributed, in the last century, and by authorities not liable to a suspicion of partiality, to the example of the English residents at Lisbon, who being partial to rural life, took pains to embellish their country-houses and gardens according to the fashion of their native country, and thus inspired the Portuguese with a taste for imitating them by availing themselves of the abundant resources which a fine soil, a favourable site, and a genial clime afford. (Du Chatelet and Bourgoing, *Voyages en Portugal*.) The vineyards of Bucellas, Carcavellas, and Collares, produce excellent wine. The neighbourhoods of Mafra, Cintra, Cascaes, Queluz, Caneças, are justly celebrated for their romantic position. A pleasing sketch of these delightful spots is given in Baillie's *Recollections of Portugal*, 1835.

The south-eastern part of Estremadura, which lies on the left or south bank of the Tagus, is not so fine as that on the right bank, being mostly sandy, and unhealthy in several places. A range of hills which is a continuation of the Serra de Portel in Alentejo, which is itself joined to the mountains of Spanish Estremadura, runs from east to west at a short distance south of the Tagus, enters Portuguese Estremadura north of Setubal, and terminates on the peninsula of Almada opposite to Lisbon. But the limits between Estremadura and Alentejo are not marked by this range, the line of demarcation being a tortuous and capricious one, beginning from the sea north of Cape Sines, then taking a semicircular sweep to the eastward, crossing the river Sadaõ and the range above mentioned east of Alcacer do Sal, and then turning northwards and following the course of the river Canha to the Tagus. The country inclosed within this line, the sea and the Tagus, forms the comarca or district of Setubal which is included in the province of Estremadura. But farther to the east Estremadura again encroaches upon Alentejo, extending along the left bank of the Tagus from Salvaterra up to Perales, which lies nearly opposite Abrantes and the hills called Cimes de Ourem: the limits between Estremadura and Alentejo are marked on this side by the course of the rivers Soro and Zatas, the latter of which falls into the Tagus. This part of Estremadura contains the territories of Chamusca, Almeirim, and Salvaterra, which are included in the administrative districts of Santarem and Alemquer beyond the Tagus. According to a new territorial division planned by the Cortes of 1822, the Tagus was to form the southern boundary of Estremadura, the whole left bank being considered as belonging to Alentejo. But the political convulsions that followed prevented the new plan from being put into execution.

Estremadura is divided into the following comarcas or districts:—1. Lisbon, which includes the capital and its suburbs; Belem, with its splendid monastery; Bemfica, near the fine aqueduct of Agoas Livres, which carries the water to Lisbon; Campo Grande, with an important manufactory of silks; Bellas, with 3400 inhabitants; Oeiras on the Tagus below Belem, once the residence of the marquis de Pombal. The population of the comarca of Lisbon is estimated at 360,000. 2. Torres Vedras, with the town of that name, 3400 inhabitants; and also Mafra, with 3000, and its splendid palace, church, and convent, called the Escurial of Portugal, and a vast royal park; Ericeira, near Mafra, a small fishing harbour; and the port of Cascaes, near the entrance of the Tagus. 3. Villa Franca, with the pretty town of that name on the Tagus above Lisbon, with 4000 inhabitants; and Alhandra, with 2000, a manufactory of lime, and brick kilns, which supply Lisbon with bricks. 4. Alemquer, with the town of that name, 2600 inhabitants, and a paper manufactory; and the town of Chamusca beyond the Tagus, with 3000. 5. Santarem: the town of that name stands on a steep hill rising above the Tagus, with several massive convents and other extensive buildings, and an old castle, and 7300 inhabitants. The other towns of this district are: Torres Novas, a lively place in a fine country, with about 4000 inhabitants; Golegaõ on the Tagus, where one of the principal fairs of Portugal is held; Salvaterra de Magos, on the left bank of the river, with a royal villa and hunting park, which contains wild boars. 6. Thomar, containing the town of Thomar, east of Santarem, with 4000 inhabitants, a large manufactory for spinning cotton, manufactories of hats and printed stuffs, and a vast convent belonging to the military order of Christ. The other towns are: Abrantes, on the slope of a hill above the Tagus, with 5000 inhabitants, the fine church of St. Vincent, and a bridge of boats over the Tagus. The navigation of the river does not extend much above Abrantes, which is about 90 miles above Lisbon by the course of the river. Punhete, at the confluence of the Zezere with the Tagus, Sardoal, with 3000 inhabitants, and Pedrogaõ, at the foot of the Estrella, belong also to the district of Thomar. 7. Ourem, north-west of Thomar; the town of that name has 3000 inhabitants. 8. Leiria, containing the town of the same name, with 2000 inhabitants, with a bishop's see and a castle, on a steep hill. Near it is the village of Marinhagrande, with a glass manufactory, established by an English speculator. The other towns of this district are: Pombal, near the

ders of Beira, with 4000 inhabitants. Batalha, near Leiria, with its splendid convent and church, one of the finest specimens of Norman-Gothic architecture, it was built by King John I. after the victory which he gained over the Spaniards at Aljubarrota, in the neighbourhood. The church contains the tombs of the kings of Portugal. 9. Alcobaça, containing the town of Alcobaça, south-west of Leiria, with about 1500 inhabitants and a magnificent convent. The harbour of Peniche, who is near Alcobaça, and further south is the strong castle of Peniche, on a promontory facing the Berlengas Islands. 10. The district of Setubal. The town of that name, often by corruption called St. Ubes, is at the mouth of the river Sadaõ, has a good harbour and 15,000 inhabitants, and exports large quantities of salt, which is made from sea-water in the neighbourhood, and also wine and fruits, especially oranges. It is, next to Lisbon and Oporto, the most commercial place in the kingdom. The river Sadaõ rises in the Serra de Monchique, on the borders of Algarves, and is navigable for about 30 miles above Setubal. The other towns of this district are Almada, opposite to Lisbon, with 4000 inhabitants. Aldea Gallega, higher up the river, which is the common landing place from Lisbon to the southern provinces, it has about 4000 inhabitants, chiefly boatmen and fishermen. Cezimbra, west of Setubal, near Cape Espichel, with a small harbour and 4000 inhabitants, chiefly fishermen. Alcacer do Sal and Azeitaõ are small towns in the interior.

The whole population of Estremadura is reckoned by Miñano at 800 000 inhabitants. Its area has been variously stated, according to Antillon and Miñano it is 7?0 square Spanish leagues of 20 to a lineal degree of latitude. The climate is generally healthy being free from the excessive heats of Alentejo and from the cold winters of Beira. The westerly winds, which find an opening along the wide valley of the Tagus, refresh the air. The rivers, as well as the sea coast, abound with fish. The principal products of the country are wine, oil, maize, fruits of every sort, and cattle. Wheat and oats are rather scarce, but Lisbon imports corn and flour from other countries.

ESTREMOS, one of the strongest fortresses in Portugal, agreeably situated on the Tarra in Alentejo. It consists of the upper and the lower towns, the former with the citadel standing on an eminence, the latter in the valley below. Population 6500. Here Schomberg gained a victory over the Spaniards in 1663, 38° 46′ N. lat., 7° 23′ W. long.

ESTUARY. [ÆSTUARY.]

ETÆ'RIO is a kind of fruit consisting of achenia, or small closed up seed-like seed vessels placed upon a succulent receptacle. The strawberry and the raspberry are of this nature, and are very incorrectly called *berries*, in the botanical sense of the word berry. [BACCA.]

ÉTAMPES, a town in France, in the department of Seine and Oise, on the road from Paris to Orléans, 28 miles in a direct line south by west of Paris, or 31 miles by the road. Etampes is on the bank of two little streams that unite just below the town with the river Juine (or as it is sometimes called, the river Etampes), which flows into the Essone, a feeder of the Seine.

In the year 911 Etampes was burnt by the Northmen or Normans under Rollo. In the latter part of the same century, or the beginning of the next, Constance, wife of Robert, King of France, built here a castle and Robert himself converted the Oratory of the castle into a collegiate church. The castle was held for the king in the eleventh and twelfth centuries by officers who had the titles of Prévôt, [illegible], or Vicomte. There was a Jews' synagogue at Etampes, which upon the expulsion of that people from France by Philippe Auguste, A.D. 1182, was converted into a church, that of Notre Dame, yet standing. In the fourteenth century Etampes which had previously been a royal domain, was given by Philippe le Bel to his brother Louis Count of Evreux. It afterwards came successively into the hands of the Dukes of Berri, Bourgogne, Bretagne, and again of Bourgogne. In the sixteenth century Etampes, with its territory or county was erected into a duchy in favour of Jean de Brosses, whose wife was mistress of François I. In the religious wars of France, A.D. 1562, the town was taken by the Germans brought into France by the Prince of Condé. In A.D. 1567 it was taken by assault by the Huguenots; in A.D. 1589 it was the rendezvous of the troops of the League, from whom it was taken by Henri III. In A.D. 1590 it was taken from the party of the League, into whose hands it had again fallen, by Henri IV., who caused the fortifications of the castle to be razed. The town suffered much from the exactions of the contending parties in the civil war of the Fronde.

The town is in a tolerably fertile valley, and consists principally of one street. The tower of Guinette is the only remain of the antient castle. There are at present four churches. That of Notre Dame has a lofty tower and spire, the semicircular arch may be observed in it. The church of St. Giles is also very antient, it has the semicircular arch, with zig zag mouldings. There are in the town several houses built about the time of the revival of the arts, especially that of the Duchess of Etampes, mistress of François I. The town hall is an antient turreted building. There is a large public granary erected recently. Etampes is surrounded by promenades planted with trees. Near the town is an antient building, probably of Roman origin, but popularly called 'the tower of Brunehaut.' A modern castle has been erected upon these ruins.

The population of Etampes in 1832 was 8109. They manufacture soap, leather, woollen yarn, cotton counterpanes, and hosiery, and trade in wool, corn, flour, and honey. There are more than forty mills of different kinds on the two brooks which water Etampes. Sandstone is quarried in the neighbourhood, and much garden stuff raised for the supply of Paris. Etampes is the capital of an arrondissement (which had in 1832 a population of 41,208), and has a subordinate court of justice (tribunal de première instance), a high school, and an agricultural society. Guittard and Geoffroy de St. Hilaire were natives of this town.

ETAWEH, a district in the province of Agra, bounded on the north by Furruckabad and Alighur, on the east by the kingdom of Oude, on the south by Cawnpore, and on the west by the district of Agra. The district of Etaweh forms part of the Doab and was acquired by the English from the king of Oude in 1801. The principal towns are Etaweh the antient capital and Minpooree, the modern capital, Kanoje, Belah, and Shekoabad. The town of Etaweh stands on the east bank of the Jumna, in 26° 47′ N. lat. and 78° 53′ E. long., about 70 miles south-east from Agra. Minpooree is a large town on the banks of the Issa, in 27° 14′ N. lat. and 78° 54′ E. long., about 62 miles east from Agra. It stands in a fertile country, and is a populous place. Kanoje stands on the west side of the Ganges, in 2?° ?4′ N. lat. and 79° 47′ E. long., about 6? miles west north west from Lucknow. This is a very antient place, it was formerly of considerable extent, and at the period of the Mohammedan invasion was the capital of a powerful empire but at present consists of only one street. It is two miles distant from the Ganges, but is connected with that river by means of a canal. Belah is about 21 miles south south-west from Kanoje, in 26° 49′ N. lat. and 79° 27′ E. long. Shekoabad is situated in 27° 6′ N. lat. and 78° 27′ E. long., about 37 miles east-south-east from the city of Agra. The soil, productions, and climate of this district have already been described. [AGRA; DOAB.]

ETCHING. [ENGRAVING.]

ETHAL. [EDFU.]

ETHAL, a substance separated from spermaceti by Chevreul. It is a solid, fusible at nearly the same point as spermaceti, and on cooling crystallizes in plates. It is insoluble in water, but in alcohol at 150° Fahr. is much more soluble than spermaceti. It is susceptible of union with various bases, with which it forms salts or soaps.

ETHELBALD, king of Wessex, was the eldest surviving son of Ethelwulf, who resigned to him the throne of that state in 855 or 856. [ETHELWULF.] On the death of Ethelwulf in 857 or 858 Ethelbald married his young step-mother Judith of France, but the vehement remonstrances of Swithin, bishop of Winchester, prevailed upon him, after some time, to abandon the incestuous connexion. Judith afterwards became the wife of Baldwin, count of Flanders, and the ancestress of Matilda, the wife of William the Conqueror, and, through her, of all the succeeding kings of England. The chroniclers speak in very favourable terms of the subsequent conduct of Ethelbald, but although he had greatly distinguished himself in the wars with the Danes in his father's time, his own reign is not marked by any military events. He died in 860, and was succeeded by his next brother, Ethelbert.

ETHELBERT, or, as the name is written by Bede,

ETHELBERT, was the fourth king of Kent in lineal descent from Hengist, through Eric or Aesc, Octa or Ochta, and Ermenric, whom he succeeded while yet a child in the year 560. As the representative of the first leader of the Anglo Saxons and the founder of the oldest kingdom of the Heptarchy Ethelbert, as soon as he attained manhood engaged in a contest for the title of Bretwalda with Ceawlin king of Wessex, who claimed that supreme dignity as the grandson of Cerdic [ENGLAND]. He invaded Wessex in 568, but the war was speedily ended by his defeat in a great battle fought at Wibbandune, now Wimbledon, in Surrey. This was the first instance of one of the states of the Heptarchy drawing the sword against another. Ethelbert, however, according to Bede, came to be acknowledged as bretwalda about the year 593, after the decline of the fortunes of Ceawlin who was deposed about this time by his subjects and ended his days a few years after. Ethelbert retained the supremacy during all the remainder of his reign, though it would seem that his title never was acknowledged by the kings of Northumbria.

The most memorable event in the reign of Ethelbert was his conversion to Christianity and the establishment of that religion in his dominions by the ministration of St. Augustine [AUGUSTINE, ST.]. Ethelbert professed himself a Christian and was baptized on the feast of Pentecost A.D. 597. The Christian worship however must have been familiar to him long before this time, for he had been married to a Christian wife, Bertha, the daughter of Charibert, king of Paris, in the year 570, and she and her attendants had ever since practised their own faith under the guidance of Luidhard, a bishop who had accompanied her from France. After his conversion Ethelbert exerted himself with zeal in the diffusion of his new faith. He founded the bishopric of Rochester about the year 604 in his own dominions, in addition to the archbishopric of Canterbury, the establishment of which is dated from the arrival of Augustine. To him also must be principally attributed the foundation, about the same time with that of Rochester, of the bishopric of London in the state of Essex, which was at this time governed in subordination to Kent by Sebert, Sebercht, Sabert, Saebryht, or Saba, a nephew of Ethelbert. Bede says that the cathedral of London, which was dedicated, like the others that have since been built on the same site, to St. Paul, was erected at the joint expense of Ethelbert and Sebert. The conversion of the king and people of Essex had previously been effected through the influence of the king of Kent. It was also through his daughter Edilberga, who married Edwin, king of Northumbria, that Christianity was introduced into that state. [EDWIN.]

Ethelbert deserves especial remembrance in English history on another account. He is the author of the earliest of our written laws, the collection of 'Dooms,' as Bede calls them, 'which he established with the consent of his witan in the days of St. Augustine.' They are written in Saxon, or English as it is termed by Bede, although all the other Teutonic nations employed the Latin language in their codes, and they are the earliest laws that exist in any barbarous or modern tongue. There is no reason however to suppose that the regulations which they established were in general new. They relate, to quote the words of Sir F. Palgrave (*Eng. Com.* p. 44), 'only to the amount of the pecuniary fines payable for various transgressions, the offences against the church being first enumerated. These were of new introduction, but every other mulct was known before; and it is probable that the principal benefit of the law consisted in a fairer apportionment of the compensation to the crime than could be obtained according to the older customs.' The collection consists altogether of eighty-nine enactments or clauses, at least as it has come down to modern times. But the only copy of it which we possess is that contained in the volume called the 'Textus Roffensis,' which was compiled by Ernulphus, bishop of Rochester, in the early part of the twelfth century; and 'it is difficult to believe,' as Sir F. Palgrave has observed, 'that the text of an Anglo-Norman manuscript of the twelfth century exhibits an unaltered specimen of the Anglo-Saxon of the reign of Ethelbert. The language has evidently been modernized and corrupted by successive transcriptions. Some passages are quite unintelligible. Neither is there any proof whatever of the integrity of the text. It cannot be asserted with any degree of confidence that we have the whole of the law. Destitute of any statutory clause of enactment, it is from the title or rubric alone that we learn the name of the legislator.' The next oldest Anglo-Saxon laws that have been preserved (those of Hlothaire and Eadric, also kings of Kent) are more than a century and a half later than Ethelbert.

Ethelbert died in 616. He appears in his old age to have married a second wife, whose name has not been recorded. All that we know of her is that after the death of Ethelbert, her youth and beauty were sufficient to tempt his son and successor Eadbald, to take her to his bed, and of course to renounce at the same time the profession of Christianity. After a short time however Eadbald dismissed his stepmother, and returned to the faith he had abandoned, of which he ever after continued a firm supporter. The dignity of Bretwalda went on the death of Ethelbert, to Redwald, king of the East Angles.

ETHELBERT, king of Wessex, was the second surviving son of Ethelwulf, by whom he was made king of the subordinate state composed of Kent, Essex, Sussex, and Surrey in 852, on the death of Athelstan [ETHELWULF.] On the death of his elder brother Ethelbald, in 860, although excluded by his father's will from the succession to the supreme crown of Wessex, he was preferred by the Witan to his younger brother Ethelred, who claimed under the will. The chronicles celebrate the courage and military talents of Ethelbert, but no events of his short reign are distinctly recorded. It appears however that the Northmen continued to make occasional descents both on the coasts of Wessex and on those of other parts of the island. All that we are told of Ethelbert is, that he died in 865 or 866. He appears to have left a son, Ethelwald, and other children, but he was succeeded on the throne of Wessex by his younger brother Ethelred.

ETHELRED I. (called also Edelred and Ethered), king of Wessex and head of the Heptarchy, was the third surviving son of King Ethelwulf, who in his will (ratified by the Witan) appointed Ethelred to succeed to the throne immediately after his eldest brother Ethelbald; he did not however succeed till after the death of his elder brother Ethelbert in 866. (ETHELWULF and ETHELBERT of Wessex.) The reign of Ethelred was one of the deepest gloom both for Wessex and for the other states of England. In the last year of the preceding king, the great Danish chief Ragnar Lodbrog, had been taken prisoner while making an attack on Northumbria, and put to death with cruel tortures. It appears to have been with the purpose of avenging this loss that the various Scandinavian nations immediately united their strength in that great expedition against England which terminated in the conquest of half the country. The invaders, to the number of several thousands, under the command of Inguar (or Ivar) and Ubbo (or Hubba) landed on the coast of East Anglia, immediately after the accession of Ethelred to the throne of Wessex. Having encamped and passed the winter on shore, they marched into Yorkshire in the spring of 867, took possession (1st March) of the city of York, and having there (12th April) repulsed with great slaughter an attack of the Northumbrians under Osbert and Ella, made themselves masters of all the kingdom of Northumbria to the south of the Tyne, and placed Inguar over it as king. They then marched into the kingdom of Mercia, and passed the winter of 867-8 in the town of Nottingham. Beorhred, the Mercian king, now solicited the aid of Ethelred, and the king of Wessex, accompanied by his younger brother Alfred, whom he appears to have admitted to a share of the royal power, advanced with an army against the foreigner. The Danes however did not venture to engage the allied forces of Wessex and Mercia, and a treaty was made by which they agreed to evacuate Nottingham and to retire to York. In that city they remained quiet for the remainder of this year, and all the next, during which England was afflicted by a severe famine, followed by a terrible mortality both of human beings and cattle. But, in the spring of 870, disregarding the late pacification, they resumed hostilities, carrying their arms across the Humber into Lincolnshire, which was included in the dominions of Mercia. Notwithstanding some attempts to check their progress, which were made by Earl Algar, the governor of the district, they speedily overran all Lincoln and pushed their way into the adjoining territory of East Anglia, sacking and destroying in their course the abbeys of Croyland and Medehamstead (or Peterborough), the town of Huntingdon, and the nunnery of Ely, and massacring and laying waste wherever they appeared

with unheard of ferocity. At a village called Hoxton, in Norfolk, they seized Edmund, the East Anglian king, and put him to death. He sustained the torments they inflicted upon him with such constancy that he was afterwards revered as a martyr, and the 20th November, the day on which he met his fate, was assigned to him in the calendar. His death made the Danes masters of East Anglia, over which they placed Godrun, one of their chiefs, as king. They now resolved to invade Wessex, the only state which they had not either conquered or rendered powerless. They entered Berkshire under the command of Halden and Bacseg, and took the town of Reading without encountering any resistance, but they were soon after attacked by Earl Ethelwulf at the neighbouring village of Englefield, and driven from their ground with the loss of Sidrac, one of their most renowned captains. Four days after they were fallen upon at Reading by King Ethelred and his brother Alfred, but on this occasion the Saxons were repulsed with great loss, the brave Earl Ethelwulf being among the slain. The battle of Reading, however, was followed in four days more by another more important encounter at a place which the old writers call Aescesdun, or the Ash-tree Hill, and which has been supposed by some to be Aylesbury in the west, by others Ashton in the east of Berkshire. The Danes were here attacked with great impetuosity and valour by Alfred, and, notwithstanding their advantageous position, were, after a struggle of some length, completely defeated and put to flight. It is said that the English chased them for the whole of the night and next day over the country till they reached the town of Reading, in which they again shut themselves up. But a fortnight after the battle of Ash-tree Hill they again met the two kings of Wessex at Basing, in the north of Hampshire, and this time the English were worsted. A similar result attended the next battle, fought about two months after at a place called Merton, which has been variously conjectured to be Merton in Surrey, Merton in Oxfordshire, Morden in Wiltshire, and Martin in Berkshire. In this engagement, which must have taken place early in 871, Ethelred received a wound, of which he died soon after Easter, leaving the new dominions in the inheritance of the crown of Wessex, and what would at a later period have been called the suzerainty of England, to his younger brother Alfred.

ETHELRED II., surnamed the Unready, king of the Anglo-Saxons, was the youngest son of King Edgar, by his second wife, the infamous Elfrida. On the murder by Elfrida of his elder brother Edward the Martyr, in 978, he was reluctantly acknowledged as king by the Witan, in the absence of any other individual having a pretension to the crown; even Dunstan, who had steadily opposed the party of Elfrida throughout the late reign, finding himself now obliged to acquiesce in the accession of her son. He was crowned by Dunstan, at Kingston on the Thames, on the 14th of April, being at this time only about ten years old. The reign of Ethelred the Unready is one of the most calamitous and disgraceful in English history. The feeble and distracted government that arose out of his minority and the circumstances of his accession immediately drew once more upon England the attention of the northern piratical powers, who had now remitted their attacks for nearly a century. A small body of Danes landed at Southampton in 980, and scarcely a year passed afterwards in which one part or other of the country was not in like manner visited and ravaged, usually with impunity. At length, in 991, a much larger force than had before appeared arrived under two leaders named Justin and Guthmund, and after taking the town of Ipswich, proceeded to Maldon and there encountering the English army commanded by the alderman Brithnod, obtained a complete victory, Brithnod himself being slain. On this it was resolved by the English Witan on the advice, it is said, of Siric, who had succeeded Dunstan as the king's chief counsellor, to buy off the invaders with a sum of money. They agreed to accept 10,000 pounds of silver, which was accordingly paid to them, being raised by an impost on all the landed property in the kingdom, which from this time became a regular tax, under the name of the Danegeld, and was perhaps the first direct tax imposed in England. It was felt however that this was a very precarious expedient to trust to, and, as soon as the Danes were gone, the government proceeded to fit out a formidable fleet, which might perhaps have been of service if it had been ready to meet them when they arrived. As it was, it was no sooner afloat than it was rendered useless by treachery and mismanagement. A squadron of Danes having again appeared on the coast in 992, Alfric, the commander of the English fleet, when sent to surprise them, secretly gave them information of the intended attack, and then went over and joined them. The next year, when the Northmen made a descent upon the coast of Northumberland and took by storm the castle of Bamborough, the leaders of the force sent against them in like manner deserted to the enemy. In 994 a much more powerful armament than had yet appeared sailed up the Thames under the command of Sweyn or Svein, king of Denmark, and Olave, king of Norway. It consisted of ninety-four ships, and directed its first efforts against London, which however defended itself successfully against the assault. The invaders then overran and laid waste a great part of Essex, Kent, Sussex, and Hampshire. In the end they were again bought off by the payment of a sum of money, their demand this time rising to 16,000 pounds of silver. Olave now consented to embrace Christianity, and he faithfully kept his promise of never again molesting England. [illegible] the king of Denmark, his forces continued their [illegible] year after year, and at last, in 1001, Ethelred [illegible] [illegible] once more compelled to rid himself of them [illegible] [illegible] by his old expedient. He was now obliged to [illegible] them 24,000 pounds of silver.

[illegible] [illegible] the relief which he thus purchased [illegible] [illegible] it is impossible to say. [illegible] [illegible] [illegible] mode of dealing with the enemy which was of a very different character from that to which he had hitherto [illegible] combined the qualities of being [illegible] still more unjustifiable and still less likely to prove efficient. On the 13th November, the festival of St Brice, in the year 1002, the English inhabitants in [illegible] [illegible] it is said, to secret instructions received in every [illegible] from the government the evening before, [illegible] in all parts of the kingdom upon the Danes who were [illegible] [illegible] among them, and put them to death, men, women, and children. There has been some dispute as to the [illegible] [illegible] which this massacre was carried and its [illegible] [illegible] [illegible] have comprehended all the persons of Danish [illegible] [illegible] in the country [illegible] [illegible] [illegible] certain that the majority of the inhabitants [illegible] of this description; but there can be no doubt that a very large number of persons perished. This atrocious and [illegible] was unwise proceeding did not long remain without its punishment. The next year Sweyn, whose sister is said to have been among the butchered, again appeared on the south coast, and from this time it may be said the kingdom had no rest. After the devastations of the invaders had been continued for four years, they were once more bought off in 1007 by a payment of 36,000 pounds of silver. The next year by extraordinary efforts a numerous fleet was built and assembled at Sandwich, but a dispute arising among the captains, one of them deserted with twenty vessels and turned pirate, and nearly all the rest were soon after destroyed by a tempest. Meanwhile all the other forms of public calamity combined to afflict the nation. The king was an object of general hatred or contempt; the nobility were divided into hostile factions [illegible] [illegible] and contagious diseases vied with the swords of the invaders in destroying the miserable people. In 1009 a new Danish force arrived under a leader named Thurchil, who for the three following years spread devastation throughout the only part of the country that had hitherto afforded an asylum from the foreigner, that of East Anglia. At last, after he had sacked and burned the city of Canterbury, he was bought off in 1012 by a payment of [illegible] pounds of silver, and he and his followers agreed, on being allowed to settle in the country, to become the subjects of the English king. But the next year Sweyn himself again made his appearance, now avowing his determination not to depart till he had effected the conquest of the country. Entering the Humber, he received the submission both of the Northumbrians and of the people of Lincoln that were in like manner chiefly inhabited by a population of Danish descent. He then marched across the country to London, putting all the males to the sword as he advanced; but the capital, which was defended by Ethelred and Thurchil, resisting his assault, he turned to the west, and, compelling the nobles to make their submission to him wherever he passed, he proceeded to Bath, and there caused himself to be proclaimed king of England. Soon after this London submitted to his authority, and in

the middle of January, 1014, Ethelred fled to the court of Richard duke of Normandy, whose sister Emma he had married some years before. He had previously sent thither Emma and her two children.

On the 2nd of February however Sweyn died. His son Canute was immediately proclaimed king by the army; but the English determined to recall Ethelred. He was brought back accordingly, after entering into a solemn agreement with the Witan, that he would be a good lord to them, and amend all they wished to have amended, and that all things should be forgiven which had been done or said against him, they on their parts promising that they would all turn to him without fraud, and would never again permit the Danes to have dominion in England. Canute deemed it prudent to take flight before the national enthusiasm of the moment: and it is said that another general massacre of the Danes that were left behind in the country signalized the restoration of a national government. But Canute returned the following year with a powerful fleet: he was immediately joined by Thurchil, who, till now, had remained faithful to his English allegiance; other chiefs followed Thurchil's example, and a great part of the country appears to have again speedily submitted to the Danes. Ethelred was confined to his bed by illness when Canute arrived, and he died in London on the 23rd of April, 1016, at the moment when the enemy was preparing to attack that city. He was succeeded by Edmund, surnamed Ironside, his eldest son by a lady named Elfleda, who is said to have borne him six sons and four daughters, but to whom it is doubtful if he was ever married. Edward, one of his two sons by Emma of Normandy, whom he married in 1002, also afterwards ascended the throne. [EDMUND IRONSIDE, and EDWARD THE CONFESSOR.]

ETHELWULF was the son of Egbert the Great, whom he succeeded in the throne of Wessex and the supremacy over the other states of the Heptarchy, in 836. The provinces of Kent, Essex, and Sussex, which Egbert had conquered and annexed to his dominions, and also that of Surrey, which had hitherto been included in Wessex, were at the same time formed into a separate but subordinate kingdom, and put under the government of Athelstane, whom some of the chroniclers state to have been the eldest son, others a younger brother of Ethelwulf. There is no older authority than that of Malmesbury (whose account is indisputably incorrect in several particulars and improbable in others) for the story that Ethelwulf was a monk at the time of his father's death. His early education is recorded to have been conducted first by Helmstan, bishop of Winchester, and afterwards by Swithin, whom, on coming to the throne, he advanced to the same see; and he had also served with distinction in the field in the lifetime of his father. When he succeeded to the crown he retained as his chief counsellor the able Alstan, bishop of Sherborne, who had been in great favour with Egbert. What has been preserved of the history of the first fourteen or fifteen years of the reign of Ethelwulf consists almost exclusively of the detail of a series of contests with the Danes, who now continued with incessant perseverance those descents upon the English coasts which they had commenced in the preceding reign. In 837 three squadrons of them made attacks on different points nearly at the same time. The next year they landed again in great strength in Lincolnshire, and, after defeating the troops sent to oppose them, marched across and ravaged the country down to the Thames. In 839 three hard battles are recorded to have been fought at Rochester, Canterbury, and London, besides an action at sea, near Charmouth, in which the English fleet, commanded by Ethelwulf in person, sustained a defeat. For some years after this however the Northmen, abandoning Britain, directed all their efforts against the coasts of France. But in the latter part of the year 850 a body of them landed in the Isle of Thanet, when, so ill-prepared was Ethelwulf for the attack, that the foreigners were enabled for the first time to pass the winter in the country. In the spring of 851 they were joined by great numbers of their countrymen, and the whole multitude ascending the Thames in a fleet of 350 vessels, plundered Canterbury and London. They then penetrated into Surrey; but here they were met by Ethelwulf at Okeley, and after a long and obstinate battle, were defeated with immense loss. They were soon after worsted in another battle at Wenbury, in Devonshire, and also in a sea-fight near Sandwich by Athelstane, the king of Kent. The consequence was that the Danes did not again make any attempt on England during the reign of [illegible].

In 852, on the death of Athelstane, the kingdom of Kent was [illegible] by Ethelwulf to his second son, Ethelbert, he himself retaining the chief sovereignty as before. The following year, at the request of Beohred, or Burhred, king of Mercia, he [illegible] against the Welsh, and marched through their [illegible] as far as the Isle of Anglesey, compelling them to acknowledge themselves the subjects of [illegible]. On the termination of this expedition he gave his daughter [illegible]lswitha in marriage to the king of Mercia. In [illegible] he undertook a journey to Rome, accompanied by his youngest son Alfred, who had been also carried to that city in the preceding year by bishop Swithin. Ethelwulf had by this time lost his first wife Osberga, a daughter of Oslac, designated the king's cup-bearer; and now, on his return through France, he fell in love with Judith, daughter of Charles the Bald, king of that country, and married her, although she had not yet reached her twelfth year. Meanwhile however his eldest son Ethelbald, taking advantage of his father's absence (whom perhaps he represented as being in his dotage), had entered into a scheme for seizing the throne. It is said that among his accomplices was the prime minister Alstan, and that he was also supported by the chief nobility, from which we may conjecture that the attempted revolution was not without some strong reasons in its favour. And although the return of Ethelwulf is said to have prevented the full success of the design, it was substantially carried into effect. It was agreed at a solemn meeting of the Witan that Ethelbald should become king of Wessex, and that Ethelwulf should reign as sovereign, with Ethelbert under him, in Kent and the other eastern provinces. It may be supposed that in his new position Ethelwulf enjoyed little more than a nominal authority. He spent the remainder of his days mostly in exercises of devotion, and died in 857 or 858. By his will, which was confirmed by the Witan, he left the kingdom of Kent to his second son Ethelbert, and that of Wessex in succession to his other sons, Ethelbald, Ethelred, and Alfred.

One of the legislative acts of the reign of Ethelwulf has given rise to much discussion, namely, the grant which he made in 854 or 855, with the consent of the Witan, in favour of the church, and which was wont to be considered as the original foundation of the right of the clergy to the tithes. The grant is recited by Ingulfus, Malmesbury, and Matthew of Westminster, but not in the same terms. Lingard observes that 'the copies are so different, and the language is so obscure, that it is difficult to ascertain its real object; whether it were to exempt from all secular services the tenth part of each manor, whoever might be the possessor, or to annex that portion of land to the possessions which had already been settled on the church.' It cannot, Turner thinks, have been the original grant of the tithes of all England. The 'words,' he observes, 'imply either that it was a liberation of the land which the clergy had before been in possession of from all the services and payments to which the Anglo-Saxon lands were generally liable, or that it was an additional gift of land, not of tithes, either of the king's private patrimony, or of some other which is not explained.' Palgrave contends that it was not a grant of tithes, but a grant of the tenth part of the land by metes and bounds, to be held free from all secular services; yet he admits that the interpretation which construes the grant into an enfranchisement of all the lands which the church then possessed, is 'not altogether void of probability.' (*Eng. Com.* p. 159.) There is a dispute also about the date of the grant. Palgrave conceives that [illegible] made it on his return from Rome; Turner and Lingard both place it before his journey thither. The latter adds: 'This charter was at first confined to the kingdom of Wessex; but in a council of the tributary states, held at Winchester in 855, it was extended to all the nations of the Saxons.'

ETHER. [ÆTHER.]

ETHEREGE, sometimes written ETHERIDGE, SIR GEORGE, born [illegible], was a distinguished wit and dramatic writer of the reign of Charles II. According to the usual routine of a gentleman's education at that time, he studied law at an inn of court and travelled. In [illegible] he made his first public appearance as author of the comedy called 'Love in a Tub.' 'She Would if she Could' followed in 1668, and 'The Man of Mode, or Sir Fopling Flutter,' in [illegible]. All these were received with much favour by the

public, but 'Sir Fopling Flutter' has been the most esteemed. They placed him, with Buckingham, Rochester, Sedley, &c., in the first rank of the wits of the day. Ease and brilliance of dialogue are their characteristic excellence; but they have an ingrained taint of licentiousness running through the whole conception as well as the language, which has long excluded them from the stage. If the characters are supposed (which is the author's best excuse) to be but highly coloured copies of the fine gentlemen and ladies of the day, we shall marvel that the name and estimation of gentlemen should ever have been sullied by such a total want of truth and honour. Sir George Etherege's verses are not numerous, and consist of occasional pieces, lampoons, songs, and short amatory poems, some of which are of a very licentious character. Their style may be guessed from his appellations of *easy Etherege* and *gentle George*. Rochester, in his 'Session of the Poets,' gives high praise to our author, in saying that

> Of all men that writ,
> There's none had more fancy, taste, judgment, and wit.

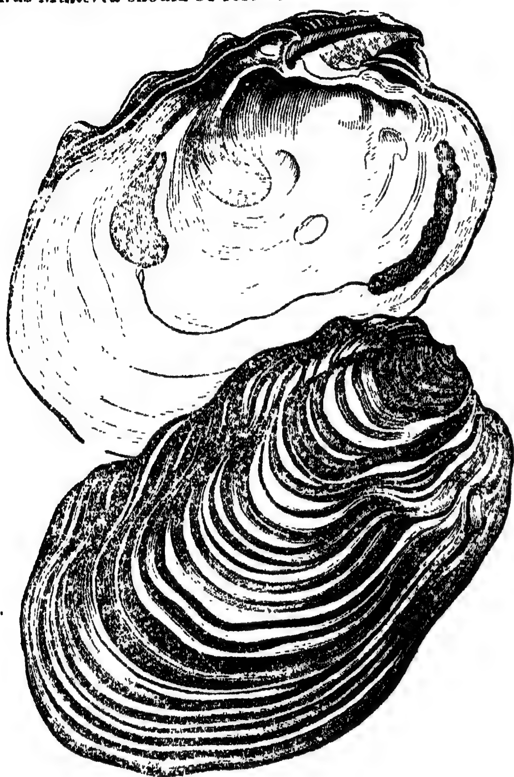
Fancy and wit may be allowed him: the taste and judgment stated Rochester's own. Etherege's private life may be guessed from his writings: play injured his fortune, debauchery his constitution. He repaired the former by marrying a rich widow, whose price was a title; and to win her he purchased his knighthood. He was in James II.'s household, and was afterwards employed by that king as minister to Ratisbon, where, by some accounts, he died from a fall down stairs after a convivial entertainment; but this appears uncertain. The time of his death seems to have been about the Revolution.

There is an edition of his Plays and Poems in 8vo., London, 1704, and one in 12mo., London, 1715.

ETHE'REUM, a theoretic carburetted hydrogen, consisting of 4 equivalents of carbon = 24, and 5 equivalents of hydrogen = 5: its equivalent is therefore 29. Among the various theories which have been proposed respecting the constitution of æthers, that which supposes it to contain ethereum (as it is termed by Dr. Kane, and *ethule* by Berzelius), as a base combined with oxygen, is perhaps to be preferred to all others. It is indeed true that ethereum has never been obtained in a separate state, but allowing its existence, æther may be regarded as an oxide of ethereum, alcohol a hydrated oxide of ethereum or a hydrate of æther, and sulphovinic acid may be viewed either as a hydrated bisulphate of oxide of ethereum, or a hydrated bisulphate of æther.

ETHE'RIA, Lamarck's name for a genus of Conchifers, placed by many authors among the *Chamidæ*, but separated by Deshayes and others from that family for the reasons assigned under the article CHAMACEA.

Animal closely approximating to that of *Unio*. Lobes of the mantle disunited throughout their length, and, consequently, without either tubes or syphons. Below the foot, the branchiæ of the right side unite themselves to those of the left side in the medial line, and leave below them a rather large canal, in which the vent terminates. The branchial leaflets are unequal, strongly striated and festooned on their free border. The mouth is rather large, and furnished on each side with a pair of palps like those of the *Uniones*. Finally, (and, as Deshayes observes, it is a great singularity in an animal that lives attached to foreign substances,) it is provided with a very large foot, which may be compared in regard of its form and position with that of *Unio*.



Shell adherent, thick, nacreous, very irregular, inequivalve, inequilateral; *umbones* short, thick, indistinct; *hinge* toothless, irregular, undulated, callous; *ligament* longitudinal, tortuous, external, penetrating pointedly into the interior of the shell; *muscular impressions* oval, irregular, one superior and posterior, the other inferior and anterior: pallial impression narrow and small.

Obs.—M. Deshayes observes that on examining the shells of this genus, in which the ligament is not ruptured, it appears that the ligament is not entirely internal or subinternal, like that of the oysters, but that it has completely the structure of external ligaments. It is when the shells are young that the structure of the ligament is most easily recognized. There are two muscular impressions, always very distinct in old individuals; but, in the young ones, it sometimes happens that one only can be distinguished, and it was upon an individual in this state of growth that M. de Férussac established his genus *Mulleria*, which, in the opinion of M. Deshayes, cannot be retained. With regard to the crenulations on the hinge adverted to by M. de Férussac, M. Deshayes states that he had seen on the very individual which M. de Férussac had in his hands some small fractures resulting, as it appeared to M. Deshayes, from this cause, namely, that the shell having been taken with the animal, the valves had been separated by attacking the ligament with a sharp instrument.

Geographical Distribution, Habits, &c.—Lamarck considered the genus *Etheria* to be marine, and accounted for its having escaped the notice of zoologists because it was attached to rocks at great depths in the sea. Mr. G. B. Sowerby, after noticing the locality attributed to the genus by Lamarck, remarks that two circumstances observable in the *Etheria* (*E. semilunata*), figured in his place, would have induced him to suspect that this was a fresh-water shell, or at least an inhabitant of æstuaries at the mouths of rivers: 1st, its having an epidermis, which remains only in those parts least exposed to the action of the water, the greater part especially of the upper valve being eroded in a very irregular manner; and 2ndly, its being partly covered with the remains of those ovate vesicular bodies, supposed to be the eggs of some molluscous animals so frequently seen on fresh-water shells. M. Cailliaud was the first to make known the fact that the genus is an inhabitant of the fresh waters, and M. de Férussac (*Mémoires de la Société d'Histoire Naturelle*, vol. i.) published a paper on the subject from M. Cailliaud's materials, in which the former also made a revision of the species. M. Deshayes, in his treatise on the genus (*Encyclopédie Méthodique*), states that individuals of the same species adhere by the one or the other valve indifferently, which, he remarks, is not the case with the oysters or the *Chamæ*. That *Etheria* may be attached indifferently by either valve there is no reason to doubt after the assertion of M. Deshayes; but Mr. Broderip (*Zool. Trans.*, vol. i.) observes that the same species of *Chama* is sometimes attached by the right, sometimes by the left valve. [CHAMACEA, vol. vi., p. 470.] M. Rang, during a voyage to Senegal, made some interesting observations on *Etheriæ* which live 200 leagues from the mouth of the river in the Senegal, and, together with M. Cailliaud, who received the animal from the Nile, published a memoir (*Mémoires du Muséum d'Histoire Naturelle*) full of interest, in which the animal was described for the first time. The rivers of Africa and Madagascar appear to have afforded the specimens (which are still rather scarce in cabinets) hitherto collected. M. de Férussac, in his memoirs, gives the following information from M. Cailliaud. 'We first meet with *Etheriæ*,' says that zealous traveller, 'after passing the first cataract; and they do not appear to exist below; they become very abundant in the province of Rebatat, beyond the peninsula of Meröe. The inhabitants collect them on the banks of the river, to ornament their tombs with them, and they say that they come from the more elevated parts of the Nile, from Saïda, where they are eaten.' M. Cailliaud found them as far as Fazoql, the most distant country into which he penetrated from the Blue River. In Sennaar, the inhabitants informed M. Cailliaud, that during the summer season, when the river was low, they took them with the animal; but notwithstanding all his endeavours, M. Cailliaud could not obtain any living specimens, the river being then always too high. They are said to be very common in the Jaboussi, a river which runs into the Blue River, and in all appearance the numerous confluent streams of this great arm of the Nile produce them also. The number found upon the tombs throughout Ethiopia is so great, that it is astonishing that Bruce and Burckhardt should not have mentioned them. (*Zool. Journ.*, vol. i.)

Lamarck recorded four species of *Etheria*, which he divided into two sections, each containing two species. The first of these consists of species which have an oblong callosity in the base of the shell; the second, of those which have no encrusted callosity at the base of the shell. These four species M. de Férussac (with justice in the opinion of M. Deshayes) reduces to two: so that the sections, as left by Lamarck, would each, in that case, consist but of one species, viz., the first of *Etheria elliptica*, and the second of *Etheria semilunata*. M. Deshayes remarks that Lamarck saw but a very small number of individuals, and not being aware of their extreme variation, established species from the form of the shell; and it is certain, he adds, that if we were to follow the same indication at the present day, we

might establish a species for each individual. He notices M. Rang's judicious observation, that in the same species there are individuals armed with spines, and others devoid of those appendages, and that the shades of this character are so gradual that it is impossible to regard it as of the smallest importance. In following out this principle, M. Rang considers *Etheria tubifera* of Sowerby and *Etheria Cailliaudi* of Férussac as identical, and *E. Carteroni* of Michelin to be the same as *E. plumbea* of Férussac. It is to the last-named species that M. Deshayes thinks that the genus *Mulleria* should be referred.

Etheria semilunata.

Etheria, or, as some write it, *Ætheria*, has not yet been discovered in a fossil state. It should be remembered that Rafinesque uses the term for a genus of Macrourous Crustaceans belonging to the *Palæmonidæ*.

ETHERINE, a peculiar carburetted hydrogen, which has also been regarded as the basis of æther. It is supposed to consist of 4 equivalents each of hydrogen and carbon.

ETHERO-SULPHURIC ACID—ETHIONIC ACID. This acid is prepared by passing the vapour of anhydrous sulphuric acid slowly into absolute alcohol kept cold; by their mutual action an oleaginous fluid is formed, without the evolution of any gaseous matter. This fluid is to be mixed with water and saturated with barytes, by which a portion of sulphate is separated, and ethero-sulphate of barytes is obtained by evaporation in vacuo.

The acid in this salt is stated to consist of—

Two equiv. of sulphuric acid . . .	80
One equiv. of etherine	28
One equiv. of water	9
Equiv. of ethero-sulphuric or ethionic acid	117

It may be considered either as a hydrated bisulphate of etherine, or as an anhydrous bisulphate of æther, or of oxide of ethereum.

ETHICS is the science which relates to our mental affections, not simply as phenomena, but as they are virtuous or vicious, right or wrong. (Dr. Thomas Brown's *Lectures*, p. 486, Edinb., 1830.) The term is derived from the Greek ἠθική, which, in signification, is equivalent with the Latin *mos*, *mores*, whence the adjective *moralis*, and the English word *morals*. Aristotle, in the second book of his Ethics, addressed to his son Nicomachus, says that moral science received the name of ethics from the word *éthos* (ἔθος), 'habit, use, or custom,' (ἠθικὴν, ἀπὸ τοῦ ἔθους, or ἀπὸ τῶν ἠθῶν), since it is from habitual experience, and the routine of customary conduct that moral dispositions and principles are gradually formed and changed. Cicero, in his work on moral ends (*De Finibus*, l. 1 and 5) briefly defines ethics, or morality, as the 'ars vivendi,' or 'doctrina bene vivendi,' that is, the art of living wisely. The scholastic treatises on ethics divide the practical part of the science into three departments *éthike* (ἠθική), which shows by appropriate precepts what is the duty of a good man; *œconómike* (οἰκονομική), which shows what is the duty of a good father of a family; and *politike* (πολιτική), which exhibits the duty of a good citizen, and of a good magistrate. [MORALS.]

E'THICUS, or Æ'THICUS, is conjectured to have lived about the fourth century of our æra, and is the reputed author of a Cosmography or short description of the world, being an enumeration of the seas, islands, provinces, mountains, rivers, and towns of the then known world, with a short account of the sources and course of the principal rivers. In speaking of the Tiber's course through Rome, he mentions the gate of St. Peter, that of St. Paul, and the Via Portuensis, or of 'the martyr St. Felix.' He also speaks of Rome as the mistress of the world, of the games held by the Romans, of the præfectus urbis, &c. These circumstances may serve to fix the time of the compilation of the work towards the end of the fourth century, when Rome had become completely Christian, but yet before Alaric's invasion. Æthicus and his Cosmography are mentioned by several writers of the following ages, and among others by Isidorus of Seville, who lived in the early part of the seventh century. Rabanus Maurus (*de Inventione Linguarum*), a writer of the ninth century, calls Æthicus 'a Scythian;' and Flodoardus, a writer of the following century, calls him 'Ister' from 'Istria.' (Vossius, *de Historicis Latinis*, b. iii.) At the beginning of his Cosmography Æthicus states that Julius Cæsar, during his consulship with M. Antony, by virtue of a senatus consultum, ordered a survey of the Roman world to be taken, and that the work was entrusted to three geometers, Zenodoxus for the eastern part, Polycleitus for the south, and Theodotus for the north, who completed their work under Augustus. This survey was probably the source from which the Antonine Itinerary was derived, which Itinerary in its present shape has also been attributed by some to Æthicus. [ANTONINUS, ITINERARY OF.] The Cosmography in most publications is followed by another and somewhat fuller description of the various parts and provinces of the world, apparently of the same period, entitled 'Alia totius Orbis Descriptio,' and generally attributed to Æthicus also, though there are doubts concerning his authorship. This second work is also found almost literally in Orosius, forming the second chapter of his history. It has been suggested that Orosius may have copied it from Æthicus, and the text of Orosius has certainly the appearance of a copy, as he has shortened the beginning or introductory part, and also left out the concluding sentence, in which the author of the description, as we have it separately, promises to give a continuation of his work, or an ampler description of the towns, &c., beginning from Rome, which he styles 'Caput Mundi et Domina Senatus.' (Simler's edition of Æthicus, Basil, 1575.) This last sentence promising a fuller account, which the author did not fulfil or which has been lost, would not have fitted Orosius's historical narrative, and therefore he left it out. But it is also worthy of remark that in two MSS. of Orosius in the national library at Paris, Nos. 4878 and 4882, the second chapter ends with these words, which are not found in the other MSS. and printed editions of Orosius: 'Percensui breviter ut potui provincias et insulas Orbis Universi, *quas Solinus ita descripsit*.' This would seem to attribute the work to Solinus.

To the two Cosmographies attributed to Æthicus is added, in some editions, another extract, which is styled 'Julii Honorii Oratoris Excerpta quæ ad Cosmographiam pertinent.' It is in its plan similar to the first Cosmography of Æthicus, only perhaps still dryer and more incorrect. The three have been published, together with Pomponius Mela, by Gronovius, Leyden, 1635.

ETHIO'PIA (Αἰθιοπία) was the name given by the antient geographers to the countries south of Egypt. In a more general and vague sense they called Ethiopians all the inhabitants of the south part of Africa, from the Red Sea to the Atlantic. Herodotus (iv. 197) speaks of the Ethiopians as inhabiting the whole of South Libya (Libya is with

him synonymous with our Africa), as distinguished from the Libyans who inhabited the Mediterranean coast and the interior adjoining it. He also speaks of the Ethiopian Troglodytes (iv. 183) who lived to the south of the Garamantes, and tells strange stories of them; but these particular Ethiopians must be considered included under the general name. Strabo places the Hesperian Ethiopians near the Atlantic Sea, and south of the Pharusii and Negretes, who were themselves south of the Mauri. In this general sense, Ethiopians corresponded with the inhabitants of the countries south of the great desert, of which the antients knew very little. Herodotus (vii. 70) also speaks of Asiatic Ethiopians, who formed part of the great army of Xerxes; but their locality is not easily determined. The historian however observes that the Asiatic Ethiopians were black, like those of Libya, but differed from them in language, and had straight hair; whereas those of Libya had very *curly* hair, by which term some modern writers have perhaps too hastily concluded that the woolly hair of the negro is intended. But Eastern Ethiopia, properly called Ethiopia above Egypt (Herod., vii. 69), and also Ethiopia Orientalis, was a distinct and better-defined country. It included those regions which we now call by the name of Nubia and Sennaar, and perhaps part of Abyssinia, but to the south its limits were not known. Herodotus, however, it should be observed, clearly distinguishes the Ethiopians immediately south of Egypt from those whom he calls long-lived Ethiopians (iii. 17), whom he places on the shores of the southern sea. But what country we must consider as inhabited by these long lived Ethiopians, it seems impossible to say.

Meroe, which lay above the confluence of the Astaboras (Tacazze) and the Nile, was the antient capital of Ethiopia, in the limited and more definite sense of Ethiopia above Egypt, in which sense we shall now consider the term. The Troglodytæ bordered upon Ethiopia to the east, extending along the coast of the Red Sea. To the west of Ethiopia were the Blemmyes, a barbarian tribe, of whom wonderful stories were told as having no heads, but eyes and a mouth fixed in the breast. Ethiopia was a country early reduced to a fixed social state, and was held traditionally to have been the parent of Egyptian civilization and religion. Its government was monarchical, but the monarch was subordinate to an all-powerful hierarchy, more absolute than that of Egypt. Diodorus (iii. 6) says, 'in Ethiopia, when the priests think proper, they send a message to the king with orders for him to die, the gods having so communicated their pleasure, which no mortal should dispute.'

It has been long a subject of discussion among the investigators of antiquity whether the arts of civilized life descended from Ethiopia to Egypt, or ascended from Egypt into Ethiopia. Here, as in many other contested historical points, much discrimination is required. It would appear, from tradition, that at a very remote period religious colonies came down from Meroe into Egypt. Herodotus (ii. 29) says, 'at Meroe, the great city of the Ethiopians, the people worship only Zeus and Dionysus (Ammon and Osiris), and them they honour greatly. They have an oracle of Zeus, and they make their expeditions whenever and wherever the Deity, by his oracular answers, orders them.' This shows that the priests of Meroe sent colonies into other countries, and Egypt was naturally one of the first lands to which they would resort. The worship of Ammon (the Zeus or Jupiter of the Greeks and Romans), which was carried by them down the Nile, was a simpler and purer form of worship than the absurd assemblage of deities which afterwards gained ground in Egypt. The procession of the Holy Ship, with the shrine of the ram-headed Ammon, which took place annually at Thebes, and which was carried across the Nile to the Libyan side and brought back after a few days, was in commemoration of the first advent of the god from Ethiopia by the river. This ceremony is sculptured on several Egyptian and Nubian temples, and especially on the great temple of Carnak. Homer probably alludes to it when he speaks of Jupiter's visit to the Ethiopians and his twelve days' absence. It appears also that the worship of Isis descended the Nile from the farthest regions of Ethiopia. Diodorus (iii. 3) says that 'the people above Meroe worship Isis and Pan, and besides them Hercules and Zeus, considering these deities as the chief benefactors of the human race.' Isis' heads have been found by Cailliaud at Naga, near Shendy, (about 17° N. lat.) in Upper Nubia, the sculptures bearing all the marks of an original style, though of a coarser art than that displayed in the same figures in the Egyptian temples. The head of Isis is placed above that of Typhon, as in some of the temples of Egypt. These temples of Naga however may be supposed, from their style and sculptures, to be of a later date than those at El Mecaourah, which are also in the district of Shendy, in a valley in the desert, at some distance from the Nile, and about twelve miles nearly north of Naga: they consist of eight temples, of small dimensions, the largest being only thirty-four feet long, connected by galleries and terraces, with a great number of small chambers, the whole being surrounded by a double enclosure. There are no tombs nor remains of private habitations in the neighbourhood. Traces of a large tank are seen, protected from the sand by mounds of earth all round it, the water of which served probably for religious and other purposes. The materials of the buildings are on a small scale, as well as the buildings themselves, the stones seldom exceeding one foot in length and half that in height. No sculptures or hieroglyphics adorn the walls; only on the six pillars which form the portico of the larger temple are there hieroglyphics and figures in the Egyptian style. This temple seems to be of a much later date than the rest (Cailliaud, *Voyage à Meroe*, and *plates*, and an article on the same in the Foreign Quarterly Review, No. 4, June, 1828.) It is supposed that this secluded enclosure may have been the sacred city of Meroe, the college of its priests, and the original seat of the oracle of Jupiter Ammon, whence issued those religious colonies which carried religion and civilization from Ethiopia as far as the Delta and the Oasis of the Libyan desert. According to the tradition of the country, the name of El Mecaourah was that of the antient fakirs or recluses who inhabited these edifices.

The ruins of Meroe itself are now believed to be those discovered by Cailliaud at Assour, above the confluence of the Atbara or Tacazze and the Nile, and its situation between the two rivers probably gave rise to the appellation of the Island of Meroe. The extent of the ruins is said to be more considerable than that of Napata, near Barkal, or of any other place yet examined in Nubia; they are also in general more dilapidated, and vast mounds of rubbish appear heaped up everywhere, as if formed by the ruins of private as well as public buildings. The latter consist, as at Napata, of temples and pyramids. Of the temples there is not one the remains of which can be traced with any certainty; the front wall of the largest appears to have been twenty-five feet thick. The pyramids stand in groups on the borders of the desert. The largest is about sixty feet at the base, but most of them are much smaller, and generally in a ruinous state. Most of the pyramids have little exterior sanctuaries attached to them, and in one of them Cailliaud found the roof arched with a key-stone, as in those of Mount Barkal.

The connection between Egypt and Ethiopia was renewed at various periods remote from each other, and under various circumstances. Herodotus says that he saw in the records of the priests of Memphis (ii. 100), 18 Ethiopian kings registered among the 330 successors of Menes, who preceded Sesostris. Whatever we may think of this scroll of kings, still it shows that a tradition existed of a very remote influence of Ethiopia over Egypt. This perhaps was the epoch when the worship of Ammon and Osiris was introduced into the latter country. Osiris, according to tradition, led a colony from Ethiopia into Egypt, which received also from the parent state the practice of deifying kings, together with hieroglyphical writing, the usage of embalming, the whole sacred ritual, and the forms of their sculptures. (Diodorus, iii. 3.) Afterwards Sesostris is said to have conquered Ethiopia; but this was probably a partial incursion, for Herodotus (ii.) says that Ethiopia was never conquered by any foreign power. We hear nothing of the intercourse between Ethiopia and Egypt for many centuries afterwards, during which the latter country made great progress in civilization and the arts, and built its stupendous monuments. In the eighth century B.C. the Ethiopian invasion of Egypt took place, and Sabakos, an Ethiopian king, reigned over both countries. Herodotus, who lived between two and three centuries later, says that Sabakos evacuated Egypt in obedience to an oracle, a fact which shows that the power of the Ethiopian hierarchy still continued in full vigour. Still we find other Ethiopian kings ruling successively over at least part of Egypt; among others, Tir-

hakah, mentioned in the Scriptures as having fought against Sennacherib. The commentators on the book of *Kings* (ii. 19) have considered Tirhakah to be an Arab chieftain; an error disproved, as it is considered, by the existence of his name on one of the buildings of Thebes. This period of renewed intercourse between Egypt and Ethiopia, under circumstances highly favourable to the latter, was probably the time when the improved arts of Egypt were introduced into Ethiopia, and it was probably then that the splendid structures of Mount Barkal were executed; a supposition which would be confirmed, if it be true that the name of Tirhakah is found in the hieroglyphical cartouches in the Typhonium of Barkal, according to Champollion's system. Again, under the Ptolemies there is evidence to show that Græco-Egyptian colonies found their way into the regions of the Upper Nile, and along the shores of the Red Sea, and even as far as Axum and Adule in Abyssinia [ADULE; AXUM]: these colonies or adventurers probably spread the Egyptian arts as improved by the Greeks into Ethiopia. All these vicissitudes may account for the various styles of building and sculpture found along the banks of the Upper Nile. The monuments of Assour and el Meçaourah are probably older than those of Naga, and these much older than those of Barkal, which are probably anterior to the temple of Soleb. We know from a passage of Diodorus that after the Ptolemies came to reign in Egypt a great change took place in Ethiopian politics. In the time of the second Ptolemy the Ethiopians had a king Ergamenes who had a knowledge of Greek manners and philosophy. Being weary of the yoke of the hierarchy, he went with a band of soldiers to the inaccessible place (Barkal?) which contained the golden temple of the Ethiopians, and massacred all the priests. (Heeren's work on Egypt, and the *Egyptian Antiquities in the British Museum* in the *Library of Entertaining Knowledge*.)

Of the manners of the Ethiopians we know little, except what we may infer from their monuments and the scanty records we have of their religion and institutions, as above stated. Their sacred language appears to have been the same as that of the Egyptian priests. From some sculptures at Barkal, it would seem that human sacrifices were occasionally in practice. [BARKAL.] A peculiarity in the Ethiopian institutions is, that their women sometimes went to battle, and were not excluded from the throne. Strabo (Casaub., p. 820) speaks of the Ethiopian warrior queen named Candace. (See also *Acts of the Apostles*, viii. 27.) On the propyla of one of the temples of Naga, besides the hero or king, is a female figure likewise of regal dignity, with a large knife in each hand, going to cut off the heads of a number of captives; the vulture is hovering over her head. The figures of both king and queen are remarkable for the magnificence of their dress, and though they have many characteristics of Egyptian style, they are much thicker than the Egyptian form, especially the female, which is remarkably large from the vest downwards. (See Cailliaud's Plates, 14. 16.)

After the Romans became possessed of Egypt, we read of several expeditions into Ethiopia, but of no permanent impression made by them upon that region. Caius Petronius, prefect of Egypt under Augustus, is said to have advanced as far as Napata, called Tenape by Dion, the first town of Ethiopia after Meroe He defeated Queen Candace, who was obliged to sue for peace But the Romans ultimately kept none of their conquests in that quarter. In subsequent times it appears that they conquered again, and retained a strip of territory along the banks of the Nile of seven days' march above the first cataract, but this was given up by Diocletian to the Nubæ or Nabatæ, on condition that they should prevent the Ethiopians and the Blemmyes from attacking Egypt. Of the vicissitudes and ultimate dismemberment of the antient kingdom of Meroe we have no information.

The early Christian historians seem to restrict the name of Ethiopians to a people occupying part of the country now called Abyssinia. Procopius and Cedrenus call the Axumites Ethiopians. [See the articles ADULE and AXUM.] From those times the name of Ethiopia has been given more particularly to Abyssinia, and the Geez or sacred language of that country has been called Ethiopian. [ABYSSINIA.]

The origin of the name 'Ethiopia' is uncertain. Salt says that Itiopjawan is the favourite term by which the Abyssinians designate themselves; but this name was probably introduced among the Abyssinians by the half Greeks of the kingdom of Axum. The word in Greek has the appearance of being significant, and is sometimes interpreted 'dark-coloured;' but like many other Greek names of nations, it is probably a native Asiatic or African term corrupted into the semblance of a genuine Greek word.

ETHIOPIAN LANGUAGES. Under the general designation of the Ethiopian languages, three different dialects are usually comprised, viz., the antient Ethiopian, or Geez, the Tigré, and the Amharic. The antient language properly called the Ethiopian is now extinct, or at least survives only as the language of books and of learned men (whence it is also called *lesana mas'haf*, or book-language); and its place is now supplied by the two other dialects, of which the Tigré approaches nearest to the Ethiopic, whilst the Amharic has more widely departed from it. [AMHARIC LANGUAGE.]

The Ethiopian belongs to the family of languages usually called the Semitic, and among them it shows the closest affinity to the Arabic. It is written from the left to the right, in a peculiar alphabet, which however appears to be of Semitic origin. (Compare the Ethiopian letters *kaf*, *nahar*, *ain*, and *geml*, with the corresponding Phœnician and Punic characters in Pl. v. and vi. of Gesenius' *Palæographische Studien*, Leipzig, 1835, 4to., and Pl. i. of the same author's *Scripturæ Linguæque Phœniciæ Monumenta*, Leipzig, 1837, 4to.) The alphabet consists of twenty-six consonants and seven vowel sounds; but the latter are not expressed by distinct characters, nor by points or accents, but by slight changes in the shape of the consonants, so that each character represents an entire syllable. It is well known that the antient Devanagari alphabet of the Hindus, and the system of orthography of many of the modern languages of India, are modelled on a similar principle. Several of the Ethiopian letters are now no longer distinguished in pronunciation; there are, for instance, three *h*'s, two *s*'s, two *f*'s, and *aleph*, and *aïn*, which are sounded alike, though still kept distinct in writing.

Gesenius calculates that about one-third of the roots and primitive words of the Ethiopian language exists also in Arabic; and a considerable portion of the remainder is found in Hebrew, or in the Chaldee and Syriac dialects. In the inflection of the Ethiopian verb ten conjugations are distinguished, consisting, like those of the Hebrew, Syriac, or Arabic verb, of certain modifications of the original import of the simple root, expressed according to strict analogy by modifications of the form of that root. We subjoin a paradigm showing the third person of the preterite in each of the ten conjugations with the corresponding inflections of an Arabic root. The Ethiopic verb *gabera* is used in those conjugations only to which we have added a Latin interpretation.

	Ethiopic.	Arabic.
Conj. i.	*gabera*, fecit	i. *Kabala*
ii.	*gabbára*, fieri curavit	ii. *Kabbala*
iii.	*gâbara*	iii. *Kâbala*
iv.	*agbara*, coegit	iv. *akbala*
v.	*agabara*	
vi.	*tagabera*, factus est	
vii.	*tagabbara*, opus fecit	v. *takabbala*
viii.	*tagâbara*	vi. *takâbala*
ix.	*angabara*	vii. *inkabala*
x.	*astagbara*, exegit (pecuniam)	x. *istakbala*

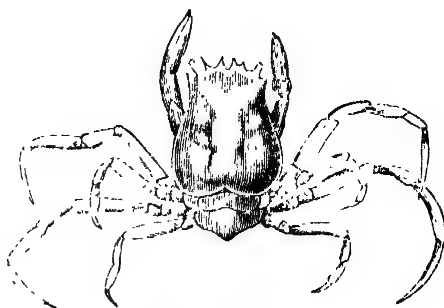
From any of those conjugations a passive voice may be derived by prefixing *ta*-. Each conjugation has, as in the other Semitic dialects, a preterite and a future tense, with a distinct subjunctive or optative form, similar to the apocopate future (*aoriste conditionnel* of De Sacy) in Arabic; an imperative and infinitive, but no participle. There is no separate inflection for the dual number either in the verb or noun. In the declension of nouns, cases are sometimes characterized by terminations analogous to those of the Arabic language. From masculine adjectives feminines are derived, nearly as in Arabic, by subjoining *-t*. The gender of substantives is twofold, masculine and feminine; yet the distinction of the two is but little attended to in Ethiopian writings. The plural is expressed as in Arabic, either by terminations (*-ân* in masculines, *-ât* in feminines), or by certain modifications of the vowels within the limits of the word.

The literature extant in the Ethiopian language is almost

exclusively biblical and ecclesiastical. The Ethiopians possess a complete translation of the Old and New Testament, made by an unknown author from the Alexandrian text of the Greek version, probably not anterior to the fourth century; besides an apocryphal writing, peculiar to themselves, called the book of Henoch, which is supposed by De Sacy to have been written during the reign of Herod the Great, and to be the book quoted in the Epistle of St. Jude (v. 14). (See *The Book of Enoch the Prophet*, &c., translated by Richard Lawrence, Oxford, 2nd edit. 1833.) There exists moreover a translation of the Didascalia, together with 56 *canones* and 81 *constitutiones* or rules of the early Christian church, considered by the Ethiopians as apostolical; besides a collection of the decrees of the councils, extracts from the writings of the early fathers, liturgies, martyrologies, and histories of saints. Hymns are not unfrequent: they are not written in any regular metre, but sometimes show a rude sort of rhythm, and often every three or five lines end in the same consonant, which constitutes a kind of rhyme. The profane literature of the Ethiopians comprises several chronicles, which appear to be of considerable interest, but have not yet been made generally accessible. Among these the Chronicle of Axum deserves to be particularly noticed, a copy of which was brought to Europe by Bruce, and is now preserved at Chelsea College, in the possession of the family of that traveller, along with numerous other oriental manuscripts left by him.

The Ethiopians have no grammars nor a dictionary, properly so called, of their antient language, and only possess vocabularies, in which words are classed according to the subjects to which they refer. In Europe the Ethiopian language was almost unknown till Job Ludolf (or Leutholf), assisted by a native of the country, made himself master of it. His first attempt at an Ethiopic dictionary and grammar was published at London, in 1661, in 4to; a much improved and enlarged edition of both works appeared at Frankfort in 1702. Since the publication of these works, little progress has been made in our knowledge of the Ethiopian language; to them therefore we refer such of our readers as may wish for further information on the subject.

ETHIOPS, a term now obsolete, but formerly used by the old chemists to denote various dark coloured metallic preparations; as *Ethiops Martialis*, which is black oxide of iron; *Ethiops Mineralis*, which is a black mixture of mercury and sulphur, &c.



ETHULE. [ETHEREUM.]

ETHU'SA, a genus of brachyurous crustaceans (Tribe *Dorippians*), established by M. Roux at the expense of the genus *Dorippe* of Fabricius and other naturalists.

M. Milne Edwards observes that this genus is easily distinguished from *Dorippe* by the conformation of the apertures leading to the respiratory cavity, which here present the normal disposition.

Carapace, nearly quadrilateral, but rather longer than it is wide, and very much flattened; *front* large, *orbits* directed forwards, very incomplete; *eyes* carried on a rather long and very projecting peduncle; they pass beyond the external angle of the carapace, and are not retractile. The *internal antennæ* are bent back (se reploient) forwards, in fossettes placed under the front; the *external antennæ* are rather long; their first joint is cylindrical, and separates the antennary fossette from the orbit; the third is longer than the second. The buccal frame (*cadre buccal*) is triangular, and reaches to the border of the antennary fossettes; the *jaw-feet* are much shorter, and leave naked the anterior portion of the jaw-feet of the first pair, which complete forwards the canal of the respiratory cavity; the third joint of the external jaw feet is shorter than the second, nearly oval, sharply truncated forwards, and articulated with the following joint by the middle of its anterior border. The *Pterygostomian regions* are nearly quadrilateral, and are not prolonged between the base of the external jaw-foot and of the first thoracic foot, as in the Dorippes. The *Sternal Plastron* is oval. The anterior feet are short and slender in both sexes; in bending they form a double elbow, as in *Homola*. The succeeding feet are long, especially those of the third pair; those of the fourth pair are, on the contrary, extremely short, and inserted below the preceding; finally, the posterior feet, longer than the fourth pair, are inserted above and in front of them, and, like them, are terminated by a very short, hooked, and subcheliform tarsus. The *abdomen* in the male has seven distinct joints; in the female it has only five: the two first rings are directed backwards and on the same plane with the carapace.

Example, *Ethusa Mascarone* (Roux), *Cancer Mascarone*, Herbst.

Ethusa Mascarone.

ETIENNE. [STEPHENS.]

ETIENNE, ST., a town in France, in the department of Loire. It is on the left or south-west bank of the Furand, a tributary of the Loire, 255 miles south-south-east of Paris in a straight line, or 317 miles by the road through Fontainebleau, Nemours, Montargis, Briare, Nevers, Moulins, Roanne, and Montbrison; or 318 miles by the road through Melun, Sens, Joigny, Auxerre, Avallon, Autun, Châlons sur Saône, Macon, and Lyon; from which last town it is distant 33 miles. It is in 45° 26′ N. lat., and 4° 23′ E. long.

St. Etienne is of comparatively modern origin. In the troubled reign of Charles VII. the townspeople obtained permission to inclose their town with walls: this was granted A.D. 1444, but the space inclosed is said to be only a tenth of that which St. Etienne now covers. The town was then called Furania: it takes its modern name from St. Etienne, a bishop of Lyon, at the beginning of the sixteenth century. The particulars which follow are chiefly from the 'Itinéraire Descriptif' of Vaysse de Villiers, Paris, A.D. 1816, corrected by some later though less ample authorities.

The site of the town may be distinguished at a distance by a dense cloud of coal smoke. It is situated in the midst of a coal-field, and coal is the only fuel employed in the various manufactories and workshops. The town is, especially the outskirts, very dirty; in summer the streets are dusty, in winter muddy, and when it rains the black dust, washed by the rain from the roofs, converts the streams that fall from the gutters into little better than ink. The houses, both in the centre and outskirts of the town, are built of a coarse-grained grey sandstone (un gres gris à gros grains), sometimes squared, at other times unhewn, the colour of which adds to the sombre character of the place, and deprives the town of that handsome appearance which its wide and tolerably straight streets and well-built houses would otherwise give to it. The centre of the town is occupied by a large and handsome though irregularly-shaped open space or 'place,' in the middle of which is a fountain adorned with a small obelisk. From this 'place' opens a new street running above half a mile in a straight line in the direction of Roanne, and terminating in the only promenade which the town possesses: the road continues in the same line for two or three miles to the village of St. Priest, where the ruins of a Gothic castle on a hill terminate the view. There are baths, a theatre, and a town-hall; the last building is handsome.

The population of St. Etienne, in 1832, was 33,064; including the neighbourhood it may be calculated at more than 50,000. Its increase of late years has been very great. The town owes its prosperity to its situation in the coal district, which not only furnishes the inhabitants of the neighbourhood with a considerable article of export (for much coal is sent to Paris), but enables the townspeople to carry on their various manufactures. The coal is abundant and of good quality; the colliers belong rather to the neighbourhood than to the town itself. The inhabitants of the town are employed either in the manufacture of firearms (which are made here to a far greater extent than in any town of France), knives, locks, and other hardwares, or in the weaving of ribands, in which it is also pre-eminent. Whole families devote themselves to each kind of manufacture: the women work in the same factory with the men, and sometimes share with them the most laborious parts of their task. There were, a very few years since, a royal

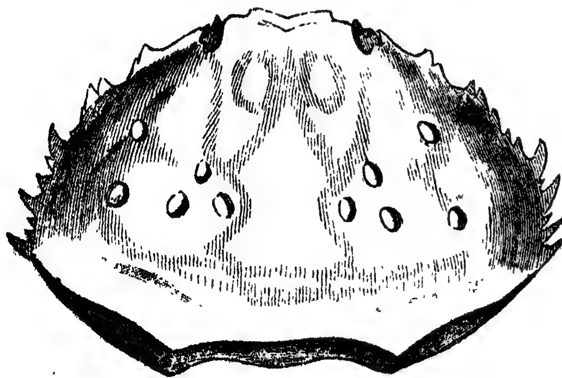
manufactory of fire-arms, forty manufactories of arms of all kinds, ten of cutlery, forty-five of hardwares, and one hundred and fifty of ribands and velvet. The waters of the Furand, which is but a small brook, are well calculated for tempering iron and steel, and also for dyeing. A railroad, more than 34 miles long, connects St. Etienne with Lyon: this work has been carried on in spite of great difficulties; hard rocks have been cut through and hollows filled up: there is a tunnel through a mountain near St. Etienne. As many as 1800 carriages are said to pass daily between the towns: stone is quarried near St. Etienne.

St. Etienne has a high school, a school for miners, a deaf and dumb school, a course of instruction in geometry and mechanics, applied to the arts, a society of agriculture and trade, and a public library.

It is the capital of an arrondissement, containing in 1832 a population of 149,189: the arrondissement is small, but there are in it several towns which are engaged in various branches of trade, similar to those carried on at St. Etienne; Chambon and Firmini, where nails and ribands are made; St. Chamond, where ribands are manufactured; and Rive de Gier, where coal is dug and iron cast. A late return assigned to the arrondissement 47,750 workmen of all kinds; of whom 3000 were colliers, 2400 engaged in iron and steel works, 3800 in manufacturing cutlery and hardwares, 2800 in making fire-arms or weapons for war or the sports of the field, 3000 in making nails, 1800 in glass works, 2900 in preparing silk, and 27,500 in the manufacture of ribands. The value of the raw materials on which these workmen were employed was estimated at 36,885,000 francs, or about 1,500,000*l.*; and it was considered that this value was doubled by the various processes of r[illegible] ture.

Before the Revolution, St. Etienne had se[illegible]gious houses.

ETI'SUS, a genus of brachyurous crustaceans (Cancerians of M. Milne Edwards).



Carapace less oval and wide than in most of the Arched Cancerians (Cancériens arqués). The front is large, lamellar, and divided on the mesial line by a fissure, as in the *Xanthi*; but the two large and truncated lobes which form the principal part are separated by a deep notch of the anterior and superior angle of the orbit, which is rounded and projecting; the latero-anterior borders of the carapace are strongly toothed. The *Internal Antennæ* are bent back nearly longitudinally, and the basilary joint of the *External Antennæ*, which is very large, unites with the front, and presents on the external side a prolongation which fills the hiatus of the internal orbital angle; finally, the moveable stem of these antennæ, which is very short, is inserted completely out of this hiatus, below the front and nearer to the antennary fossette than to the orbit. The external *jaw-feet* present nothing remarkable; the *feet* of the first pair are rather large, and the *chelæ*, which are much enlarged and rounded at the end, are deeply hollowed into a spoon-shape.

M. Milne Edwards, who gives the above description, divides this small group, which he considers as forming the passage between the *Xanthi* and *Platycarcini*, into the two following sections.

α.

Carapace scarcely knobbed above.

Example, *Etisus dentatus*. Length three or four inches; colour reddish. Locality, the Indian Archipelago.

Etisus dentatus.

β.

Carapace covered with knobs, separated by deep furrows

Example, *Etisus anaglyptus*; length about an inch and a half; colour whitish? Locality, Australasia.

ETNA. [Ætna.]

ETON. [Buckinghamshire.]

ETRU'RIA was the name given by the antient Romans to a region of Italy extending in their time from the river Macra to the Tiber, and from the Apennines to the Tyrrhenian Sea, the inhabitants of which they called Tusci, and at a later time Etrusci. The natives of Etruria however called themselves Rasena. The Greeks called them Tyrrheni, confounding them, according to the opinion of some critics, with the Tyrrhenian Pelasgi, who had occupied the western coast of Italy at a more remote date, and who being driven away by the Umbri, the Etruscans, and other Italian nations, wandered back to the Grecian islands and coasts, where they became known as pirates. But the traditions of these early migrations into and from the Italian peninsula are so extremely obscure, the statements of antient writers concerning them are so conflicting and perplexing, that the investigation is become a real labyrinth, and we can only refer inquisitive readers to Niebuhr's *History of Rome*, i., p. 1—145, and to the different systems maintained by several Italian writers, and especially by Micali in the last and much improved edition of his work, *Storia degli Antichi Popoli Italiani*, 3 vols., with an Atlas, 1832, in which he examines and combats several of Niebuhr's positions. Leaving aside the question of the origin of the Tusci or Etrusci, we find this people several centuries before the time assigned for the building of Rome settled in Italy, both north and south of the Apennines, in the plains of the Po, and on the banks of the Arno. They had conquered a great part of this vast tract of country from the Umbri, one of the oldest Italian people of which history has preserved the name. The Etruscans are said by Pliny the Elder (iii. 14) to have conquered 300 towns or villages belonging to the Umbri, who, after their subjugation, appear to have become in a great measure incorporated with the conquerors, who thus extended their dominions across the centre of the Peninsula from the Adriatic to the Mediterranean. Cupra maritima, now Grottamare, in the territory of Fermo, on the Adriatic coast, and Cupra montana, which stood near the banks of Æsis, not far from the present village of Masaccio, in the province of Ancona, were Etruscan colonies. Of the great plain of the Po, the Etrusci occupied the central part, from the left bank of the Ticinus and the right bank of the Trebbia, which separated them from the Ligurians on that side to the Athesis or Adige, which divided them from the Veneti, who remained in possession of the coast of the Adriatic as far as the mouths of the Po. (Livy, v. 33.) South of the Po the Ligurians retained possession of the highlands of the Apennines as far eastward as the sources of the Arno, which river formed at first the boundary between them and the Etruscans, who afterwards extended to the Macra, where they built Luna. The Etruscan towns in the plain of the Po are said to have been twelve, like those of Middle Etruria, south of the Apennines; but Mantua and Felsina (Bologna) were the only two remaining in the time of Pliny. The others had been destroyed by the Gauls long before. The Etruscan origin of Adria has been disputed. For the names of the other Etruscan towns north of the Apennines see Mazzocchi *Catalogo alfabetico de' Luoghi compresi nell' Etruria circumpadana*.

Towards the south, Etruria is known to have extended as far as the Tiber previous to the existence of Rome. But the Etruscans at one period went also far beyond that river. There was a tradition of their having conquered the Volsci, who afterwards recovered their independence. (Servius in *Æneid.* xi. 567.) Their regular settlement in Campania, where they are said to have also built twelve towns, was however of a later date, probably in the second or third century of Rome, when the Etruscan power, south of the Apennines, was at its height, and after they had lost by the Gallic irruption all that they possessed in the plains of the Po. The Etruscan colony founded at Capua would fall, according to Cato's statement, about the year 283 of Rome. The war of the Etruscans against Cumæ, in which they were defeated by the Syracusans in a naval fight, had happened some time before. According to this calculation the Tuscan dominion in Campania did not continue long, as the country was conquered by the Samnites about the year 330 of Rome. The extent of the Etruscan possessions in

Campania, and the number of towns which they built or colonized there, is a matter of much doubt. (Niebuhr, vol. i., *On the Opicans and Ausonians*, and, for a conflicting opinion, Micali, vol. i., ch. 7.)

The permanent power of the Etruscans lay in Etruria Proper, or Etruria Media as it has also been called, which corresponds in great measure to the present Tuscany, with the addition of that part of the papal state which lies on the right bank of the Tiber. For a geographical description of the country we refer to TUSCANY. They had twelve principal cities or states, all situated between the Arno and the Tiber, for the country between the Arno and the Macra was annexed at a later period by conquest over the Ligurians. Each state formed an independent community, the twelve being bound together by a sort of loose confederacy: at times indeed very loose, for we find repeatedly one state going to war without the assistance or interference of the rest. Of these twelve towns, eight are mentioned by Livy (xxviii. 45) on the occasion of his enumerating the allies who volunteered to assist in equipping Scipio's armament against Carthage: they are Cære, Tarquinii, Populonium, Volaterræ, Arretium, Perusia, Clusium, and Rusellæ. To these must be added Veii and Vulsinii, which had been previously conquered by the Romans. The two remaining may be selected from among Cortona, Cosa, Capena, and Fesulæ. It must be observed that long before that time some of the old cities of Etruria had dwindled away, such as Vetulonia, which had disappeared before the historical age of Rome, and of which even the site is not positively ascertained. Populonium, which was originally a colony from Volaterræ, probably took the place of Vetulonia among the twelve.

Antiquities.—We may here point out those towns in which Etruscan antiquities are still found, and thus convey some general idea of what we know of the state of the arts among that people:—

1. Arretium [AREZZO] was destroyed by Sulla, and no traces of Etruscan construction now exist. The remains of the amphitheatre are of the Roman period, when the town was restored by Mæcenas. But there are numerous Etruscan inscriptions, vases, coins, and other remains in the Museum Bacci at Arezzo, and a quantity of the red embossed pottery, 'Aretina vasa,' for which Arezzo was renowned of old, and of which enormous heaps of fragments have been found in the neighbourhood. Some of the figures are most delicately formed, and may be seen in the plates to Inghirami's work: *Monumenti Etruschi o di Etrusco Nome*. Some of the moulds have also been found. 2. Perusia [PERUGIA] is said by Cato, quoted by Servius, x. 201, to have been built by the Sarsinates, an Umbrian people, before the Etruscan time. It has no remains of Etruscan structures, except the sepulchral building called la Torre di San Manno, about a mile outside of the walls, with an arched vault of large polished stones, bearing an Etruscan inscription in three lines, which is styled by Maffei 'the queen of inscriptions,' and the gate, vulgarly called Arco di Augusto, which however is believed to be of Etruscan construction. (Orsini, *Dissertazione sull' Arco Etrusco di Perugia*, 1807.) A rich collection of Etruscan antiquities however is found in the Gabinetto Archeologico, with about 80 inscriptions, one of which consists of 45 lines, the fragments of an Etruscan quadriga, described by Inghirami (vol. vi., p. 360), and some handsome painted vases, bronzes, &c. (Vermiglioli, *Saggio dei Bronzi Etruschi trovati nell' Agro Perugino*, 4to., 1813.) 3. Cortona, the antient Corytum, retains unchanged the original circuit of its Etruscan walls, though repaired in several places. (*Pianta Topografica di Cortona* in Micali's *Atlas* annexed to his *Storia dei Popoli Italiani*.) The walls are built of enormous polygonal stones, well fitted together, without cement. There are other remains of Etruscan construction, among others the substructure of the palace Laparelli. An Etruscan tomb, called by the natives Grotta di Pittagora, is seen in one of the suburbs of the town. [CORTONA.] Other hypogea have been discovered in the country around, from which the bronzes and vases have been transferred to the town museum, but they belong mostly to the Roman period. (Repetti, *Dizionario Geografico Storico della Toscana*, 1835.) The Accademia Etrusca, established in 1726, whose president is called Lucumo, has published 10 vols. 4to. of Memoirs. 4. Fesulæ, now Fiesole, one of the oldest Etruscan cities, though perhaps not one of the twelve metropolitan ones. Its massive walls are its only Etruscan structure now existing; the theatre and other remains are of the Roman time, probably of the date of Sulla's colony. (See plan and views of Fiesole, plates 5, 11, and 12 of Micali's work, and also Bandini, *Lettere Fiesolane* and *Itinerario di una Giornata d' Istruzione à Fiesole*, 1814.) 5. Clusium, Camars in antient Etruscan, now called Chiusi, the country of Porsenna, built on a hill above the valley of the Chiana, was one of the most distinguished Etruscan cities. Of its old walls there remains nothing but a fragment built of large polygonal stones behind the choir of the cathedral. The present town is entirely modern. There are very rich collections of antiquities, urns, vases of old Etruscan manufacture, single coloured, and later ones, or Campano Etruscan as they have been styled, with figures of one or two colours different from the ground, gold ornaments, engraved stones, &c., in the houses Paolozzi, Sozzi, and Casuccini. The last mentioned is the richest, and a description of it by Valeriani, with above 200 plates, has been published under the title of *Museo Etrusco Chiusino*, 2 vols. 4to., 1833. 6. Volaterræ, Volterra, on a hill about twenty miles north-west of Siena, was about four miles in circumference: many parts of its walls as well as one of the gates, called Porta dell' Arco, are of old Etruscan construction, being built of large rectangular stones generally six feet in length, though some are much larger, set in horizontal layers without cement. In some places two of them alone, set side by side, form the thickness of the wall. Maffei considered the walls of Volterra as the best calculated to give a true impression of former Etruscan greatness. In the thermæ which were discovered by Guarnacci was found a mosaic, which is now in the city museum, together with numerous sepulchral monuments, statues, bassi rilievi, both in alabaster and sandstone, vases, pateræ, &c. On these monuments of the antient Etruscans we may, in some measure, read the history of their civilization and social economy, as we read those of Egypt on the monuments of that country, in default of written records. Guarnacci published a *Museum Antiquorum Monumentorum Etruscorum e Volaterranis Hypogeis Erutorum, cum Observationibus, A. F. Gori*, fol., 1744; see also Giorgi, *Dissertazione Accademica sopra un Monumento Etrusco ritrovato negli Antichi Suburbani di Volterra, l'anno 1746*, 4to., Firenze, 1752. But one of the most extensive and satisfactory works on Etruscan antiquities is the recent one of Inghirami already mentioned, *Monumenti Etruschi o di Etrusco Nome*, 5 vols. 4to. of text, with 6 vols. of plates, and 1 vol. index. Inghirami's collections represent chiefly objects found in the territory of Volterra, in the numerous hypogei discovered there; and they are intended to illustrate the state of the three fine arts among the Etruscans, for which purpose they are arranged in six classes. I. Funeral urns and cinerary vases in alabaster or sandstone, with sculptures. II. Pateræ, which Inghirami calls 'specchi mistici,' or mystical mirrors, with specimens of Etruscan linear drawing. III. Bronzes of cast or chiselled workmanship. IV. Specimens of Etruscan architecture, taken from their hypogei or sepulchral monuments, some of which are from Tarquinii, and other parts of antient Etruria. V. Vases, some such as those of Arezzo, all of one colour, either red or bluish black, with embossed figures, others with figures of different colour from the ground. VI. A collection of monuments, most of them not Etruscan, but which serve to compare with, and form a contrast to, those of Etruscan art. Inghirami has not included in his collection the inscriptions, cameos, gems, coins, lamps, &c., which may be found in other works, and especially in Lanzi, *Saggio di Lingua Etrusca*, 3 vols., 8vo., Rome, 1789, a work much more valuable for the quantity and variety of monuments which it illustrates, than for its hypothetical and now generally rejected system of Etruscan grammar and etymology.

Among the other Etruscan towns which are now destroyed, and of which nothing but ruins remain, may be mentioned—1. Cosa or Cossa, called Ansedonia in the middle ages, on a hill east of the lake of Orbetello, the walls of which are in tolerably good preservation, with several towers, and two gates. See *Pianta Topografica di Cossa e suoi Contorni* in Micali's *Plates*. 2. Populonium, near Porto Baratto, on the coast north of Piombino. The only remains are part of the walls, which are standing. Micali has given a plan of Populonia. 3. Rusellæ, the ruins of which are on a hill above the plain of Grosseto, about three miles from Batignano, and near the left bank of the Ombrone; the circuit of its walls, which consist of large rectangular blocks, is about two miles. Micali has given a plan of this also. 4. Saturnia, called also Aurinia, on the left bank of the river Albegna, near the foot

of the mountain of Santa Fiora, and on the borders of the Papal States, shows some fragments of its walls built of polygonal stones. 5. Tarquinii, the site of which is on the left bank of the Marta, near Corneto, exhibits no remains above ground, but the great number of hypogei, forming a vast necropolis in the neighbourhood, give an idea of its former importance. They are excavated in the rock, which is of volcanic formation; some of the chambers are square, fifty feet on each side, and about six feet high; the ceiling is carved into square compartments, and is supported by square pillars of the rock itself; the sides are adorned with stuccoes and paintings, some of them allegorical of the state of the soul after death, others representing funeral processions, games, banquets, &c. A number of urns, vases, mosaics, arms, and some skeletons, have been found within these sepulchres, which may be said almost to rival, for the interest they excite, those discovered in Egypt by Belzoni. The first Tarquinian hypogei were discovered about 1780, by Cardinal Garampi, and representations of them are given in D'Agincourt's work, vol. iv., plates 10 and 11. But the greatest discoveries have been made of late years, engravings of which are given in Inghirami's and Micali's works.

Farther inland, about ten miles north of Tarquinii, near the village of Canino, Lucien Bonaparte has discovered a vast quantity of similar remains of Etruscan art, of which he has formed a valuable museum at Canino, and of which he has published a description. (*Museum Etrusque de Lucien Bonaparte, Prince de Canino*, in parts, 1829.) These discoveries have revived the question between the partizans of an original Etruscan civilization, and those who derive it from the Greeks. Probably the question might be solved by admitting various epochs of Etruscan art, one anterior and the other posterior to the intercourse which existed between the Etruscans and the Greeks about the second or third century of Rome. Even in the monuments of Tarquinii and Canino two styles are discernible. Other proprietors in the same district have made further discoveries. On the right bank of the river Fiora, in the district of Montalto, extensive remains seem to mark the site of the Etruscan Vulcia, which was conquered by the Romans at the same time as Vulsinii, about the year 473 of Rome. Here also a vast necropolis has been found, with a quantity of vases, paintings, and other antiquities. At a place called la Cucumella, a group of buildings of large rectangular stones, consisting of cells and two towers, one square and the other circular, above thirty feet high, have been found buried in an artificial mound or barrow. At the top of the towers were winged sphinxes in stone, and below some lions and griffins. Micali, plate 62, gives the plan and views of these monuments, which are one of the most curious Etruscan discoveries hitherto made. In 1832 only one-third part of the mound had been dug up, so that further structures may still be found.

The site of Cære or Agylla lay near the village of Cervetere or Cervetri, between Rome and Civitavecchia. Its port, Pyrgos, was near where the coast-tower of Santa Severa is now. No remains of either have been discovered. The antient Vulsinii has been likewise completely destroyed [Bolsena]. The site of Veii has been long a subject of dispute, but it seems now ascertained to be on a steep hill, at the foot of which two streams unite, and form the Cremera which falls into the Tiber. This hill is about a mile and a half east of the hamlet of La Storta, the last stage on the northern road to Rome. The farm called Isola Farnese occupies part of the site of antient Veii. The remains which have been discovered on the spot since 1810 belong to the Roman colony sent there by Livia. The walls of Falerii, which still exist in a desert spot near Civita Castellana, are not always numbered among the Etruscan remains, as that town is said to have been built before the Etruscan conquest. The amphitheatre cut in the rock at Sutri is attributed to the Etruscans.

History and Social State.—Varro mentions the Etruscan annals existing in his time as having been written in the eighth age of Etruria, which is supposed to correspond to the fourth century of Rome. Two Latin writers, Valerius Flaccus and Cæcina, the latter a native of Volaterræ, wrote histories of Etruria, and the emperor Claudius wrote in Greek his Tyrrhenicon or History of Etruria, in twenty books; but all these are lost, as well as the books of Dionysius, in which he treated more particularly of the Etruscans. The little we know therefore of the national history of Etruria previous to their wars with Rome, is gathered from fragments and incidental notices in Greek and Roman writers. The Etruscan power appears to have been at its height in the third century of Rome, about the beginning of the fifth century before Christ. Their dominion extended over the country of the Umbrians to the Adriatic on one side, and to the Gulf of Luni on the other. After Porsenna had dictated a humiliating peace to Rome, the Tuscans overran Latium, and conquered Campania. By sea they rivalled the Carthaginians, with whom they at first allied themselves against the Phocæans, who had settled at Aleria in Corsica, but afterwards the allies quarrelled together for the possession of the same island. They fought against the Cumans and Syracusans united about the year 279 of Rome, and were defeated. Half a century later they lost Campania to the Samnites, after which the Romans began to encroach on that part of Etruria which lay between Mount Ciminus and the Tiber. Veii was the first Etruscan city that fell by the Roman arms; Falerii and Fescennia next; Sutrium submitted: Cære and Tarquinii became the allies of Rome; and the Ciminus ridge with its haunted forests formed the boundary between Rome and Etruria. The Roman arms halted nearly a century longer before they passed that boundary. The total defeat of the confederated Etruscan forces at the lake Vadimonis, in the year 444 of Rome, opened to the Romans the access into the Etruria Transcimina. Vulsinii and Vulcia fell before the slow but sure progress of their arms; the other cities, such as Arretium, Perusia, Volaterræ, Populonium, disguised their submission under the name of allies, but Etruscan independence was gone. This appears to have been a period of general corruption of manners, when all national spirit and independence became extinct, but wealth, luxury, and internal peace remained, and sensual pleasures were the chief occupation of the people; and this was also the time when the earlier Roman writers who speak of the Etruscans, such as Plautus, Cato, and Varro, became acquainted with that people. The wars and proscriptions of Sulla gave a final blow to the existence of the Etruscans as a nation; their towns were destroyed, and their lands were given to military colonists. The proscriptions of Octavianus after the battle of Perusia, completed the desolation of Etruria. The language itself gradually became obliterated among the people, and was only known to the priests, with whom it became finally extinct, probably by the spreading of Christianity in the fourth century of our æra. It is now acknowledged by Micali, Orioli, Inghirami, as well as by Niebuhr, that the Etruscan language is lost, and that its pretended affinity to Greek, as maintained by Lanzi and others, has no foundation.

With regard to the political and social institutions of the Etruscans, we cannot do better than refer to Micali's work (vol. ii., chapters 21 to 24), in which he gives a fair and tolerably well authenticated sketch of their government, their religion and morality, and their domestic manners. We ought to bear in mind that all the accounts we have of the Etruscans were written after their subjugation to Rome, and that a nation which had a political existence of eight or ten centuries must have undergone considerable chan in its manners and institutions. Each of the twelve principal cities of Etruria ruled over the population of its respective district, which was perhaps originally a conquered race. In the city itself were two orders, the hereditary families of patricians or senators, and the commonalty. Political and religious power were in the hands of the former, who elected from their own body the annual magistrate called Lucumo We know that the lucumo at times contrived, especially in times of war, to protract his term of office, and sometimes to retain it for life; but all attempts to make it hereditary appear to have failed. The patrician and hierarchal order appears to have maintained to the last its sway among the Etruscans, the arts of divination, of which it was in exclusive possession, being a powerful instrument in its hands, among a people so much fashioned to religious observances and rites, for repressing all attempts of the commonalty. Accordingly we hear of no struggles of the kind in Etruria, as at Rome; but we hear of revolts of slaves against their masters, as in the case of Vulsinii, for the Etruscans had numerous slaves. Their sway over the people whom they conquered, such as the Umbri, appears to have been mild: they did not destroy their towns, but surrounded them with walls, or built new ones; they taught them agriculture and other arts, they instructed them in religion,

and they are acknowledged to have been the civilizers of a great part of Italy. Rome derived its earlier civilization from Etruria. The art of fortifying towns with walls and towers is attributed to them. They wrought the iron which they drew from the island of Elba, they cast bronze, and they made silver vases and gold ornaments: they engraved on stone, and sculptures of primitive art are found on their oldest monuments. They are supposed by many to have been the inventors of the arch at a very remote period; Tuscan masons employed it in constructing the Cloaca Maxima of Rome. They understood hydraulics, especially the art of filling up marshes by diverting into them the course of muddy streams, which is still practised with great success in Tuscany under the name of 'colmate.' The invention of the termini, or stones fixing the limits of property, is attributed to them. The rights of property, those of paternal authority, of testamentary will, of connubia or marriages, were all fixed by law and consecrated by religious rites. Their laws concerning debtors appear to have been more humane than those of Rome, if we are to trust to a passage of Heraclides in which he speaks of the Tyrrhenians.

The Etruscans were fond of good living and of sumptuous banquets, and they are called gluttons, fat, and corpulent, by the Roman satirists. Virgil (xi. 735) accuses them of being given to all kinds of sensual pleasures. Their women seem to have had no great reputation for chastity (Plautus, *Cistell.* 2. 3. 20, and Horace, iii. *Ode* x. 11); yet we find the female sex in higher honour among them than among most nations of antiquity. The women reclined at table on the same triclinia with the men, as appears by their monuments. Their funerals were pompous, and accompanied by athletic games, but the combats of gladiators appear to have been of a late introduction, and it is believed that they originated in Campania, and from thence spread over the rest of Italy about the fifth century of Rome. From some sculptures found on their monuments it would appear as if human sacrifices were at one time in practice among them, unless these representations be symbolical, as some suppose. The mythology of the Etruscans was partly of native, partly of oriental invention. They believed in two principles, a good and an evil one, each having its respective agents or genii, and their paintings and sculptures are often representative of the perpetual struggle between the two. Twelve gods, six male and six female, at the head of which was Jupiter, formed the upper hierarchy; other inferior divinities presided over the various elements and phenomena of this earth, as well as over the occupations and domestic comforts of man. Cicero speaks very favourably of Etruscan theosophy, saying that they referred every thing to God, and that all their religious institutions were studiously calculated for the prosperity and security of the state. For further particulars on these subjects, see Micali, ch. 22 and 23, Bossi, *Storia d'Italia*, lib. i., chap. 6, and Müller, *die Etrusker;* Dempster, *De Etruria Regali*, with the continuation by Passeri, is also a work of much information, apart from the system and favourite hypothesis of the writers. These, with the other works already mentioned, form the best Etruscan library that can be collected.

ETRUSCAN ARCHITECTURE. We have no remains of Etruscan temples or other buildings, but we can form some idea of their style from their hypogei or sepulchral monuments, and also from some of their cinerary urns which represent a temple. (Micali, plate 72.) But the monuments which serve perhaps to throw most light on this subject are those discovered at Castel d'Asso, the Axia of Cicero (*Pro Cæcina*, 7), five miles south-west of Viterbo, where the rock forming one side of the valley facing the old castle is sculptured all along for more than a mile in the shape of so many fronts or façades of sepulchral monuments, the vaults themselves being excavated underneath. Similar sculptures on the rock are found at Norchia, about 15 miles south-west of Viterbo. (See Inghirami's *plates.*) These monuments, which represent a primitive style of Etruscan building, strike by their resemblance to the Egyptian style in its ruder and simpler form. Plate 62 of Micali represents a monument between Monte Romano and Corneto, with projecting architrave and lateral pillars. Vitruvius, although he lived in an age when Etruscan art had undergone considerable alteration, characterizes their buildings as 'baricephalæ, humiles, latæ,' low, wide, with heavy top ornaments. And this seems to be in keeping with the character of the people, grave, and more fond of internal comfort than of external show. What is now called the Tuscan or Tuscanic order appears to have been a sort of rude Doric, which they probably adopted from the Greeks. [CIVIL ARCHITECTURE.] Vitruvius (iv. 7) gives a description of their temples with three cellæ, but they appear to have been neither large nor splendid: the ornaments, bronzes, and plastic figures appear to have been more elaborate than the structures themselves. In the time of Vitruvius the houses of the wealthy Etruscans had external porticoes or vestibula, in which the crowd of servants and clients remained in waiting. The Atrium is also supposed by some to be of Etruscan invention. [ATRIUM.] If not the inventors of the arch, the Etruscans were certainly acquainted with it at a very early period: it is found in their sepulchral monuments, in their gates, and they used it in constructing the Roman cloacæ. Another cloaca of similar construction has been discovered near Tarquinii. Their skill in fortifying towns with walls and towers and ditches, and leaving an open space around called Pomœrium, is attested by the Roman writers, and by the inspection of the remains of their walls. The use of large polygonal stones in the construction of walls was common to other Italian people as well as the Etruscans and primitive Greeks; and the name of Pelasgic, which has been given to these walls, appears to be incorrect, as it does not distinguish any particular class of these walls or the walls of any particular locality from other walls of the same kind. If by this term Pelasgic it is meant to assert that all such walls are really of Pelasgic origin, this is more than can be proved or presumed. In most instances, however, the Etruscans appear to have used rectangular stones, ranged in horizontal layers, and uniformly without any cement. For more complete information of what is known of Etruscan architecture, we must refer to Micali, ch. xxv., Inghirami's *text* and *plates, Series* IV., and Orioli, *Dei Sepolcrali Edifizi dell' Etruria Media*, also quoted by Inghirami.

ETRUSCANS. [ETRURIA.]

ETSCH. [ADIGE.]

ETYMOLOGY. [LANGUAGE.]

ETYMOLO'GICUM MAGNUM (τὸ μέγα ἐτυμολογικόν), an important vocabulary of the Greek language, of which the author is unknown. Some suppose it was written by a grammarian of the name of Magnus. The idea that it was compiled by Marcus Musurus, the first editor, or the Calliergi, is disproved by the fact that this dictionary is referred to by Eustathius. Sylburg considers it as old as the tenth century: much older it certainly was not; for Theognotus, a writer of the ninth century, is quoted in it. The derivations in this work, like most of those attempted by the Greeks themselves, are based upon no principle, and though in some instances accidentally right, they are generally full of the wildest absurdities, as one might expect from the author being confined to mere guess-work. It is valuable however for containing a great many traditions with regard to the meanings of old or uncommon words, and it often enables the scholar to correct the errors of the corrupt but inestimable lexicon of Hesychius. The edition of Sylburg (1594) is very useful, and has an admirable index: the edition of the Etymologicum Magnum, by Schäfer, Lips., 1816, is a reprint of Sylburg's edition. The edition by Sturz, Lips., 1818, 4to., intitled Etymologicum Græcæ Linguæ Gudianum, &c., is founded on the Codex Gudianus, which is more complete than that on which the edition of Musurus and the others already enumerated are based.

EU, a town in France, in the department of Seine Inférieure, on the south-west bank of the little river Bresle, near its mouth. Eu is 91 miles in a direct line N.N.W. of Paris.

In the middle ages Eu became a strong and flourishing place: but on the threat of a descent by the English it was burnt, in 1475, by order of Louis XI., and has never recovered the blow: Dieppe and other neighbouring places profited by its downfal. Only the churches and a few houses that were overlooked escaped the general destruction. The massive ruins of the walls and towers yet remain.

Eu has several churches: the finest, that of Notre Dame, is large and of beautiful Gothic architecture. A crypt contains the monuments of the counts of Eu: these monuments were much damaged in the Revolution. A small church adjoining the High School, formerly the Jesuits' College, contains the monument of the duke of Guise, murdered at

Blois in 1588. There are two châteaux. Of one of these, built by a daughter of the duke of Penthièvre, afterwards duchess of Orléans, only half remains, the rest having been destroyed in the Revolution. The situation of the château is charming: the park has an avenue of fine beech trees. There is an hospital attended by the Sœurs de la Charité. The market-place is good. La Chaussée d'Eu is a suburb of Eu, on the opposite bank of the Bresle. Tréport, at the mouth of the river, is the port of Eu: it has a church singularly situated on the extreme verge of a lofty and almost perpendicular cliff, and a projecting doorway of beautiful Gothic architecture.

The population of Eu in 1832 was 3356, that of Tréport 2061, together 5417: the population of the respective communes was 3543 and 2267, together 5810. The population of La Chaussée d'Eu is not given in our authorities. The manufactures of Eu are linseed oil, soap, locks and other ironmongery, leather, cotton yarn, glass, sail-cloth, linen and lace. Eu serves as a mart for the corn of the department of Somme, which is imported into that of Seine Inférieure. There is a school of mutual instruction, which was established by the King of the French when duke of Orléans. There is a tribunal de commerce or court for the decision of mercantile disputes.

EUBŒA (Εὔβοια), now called Negropont, is an island of the Mediterranean, lying along the coasts of Attica and Bœotia, from which it is separated by the Euripus, a very narrow channel, over which a bridge has been thrown, connecting the island with the main-land. It is 90 miles in length in a north-west direction, and 30 miles in extreme breadth; but in one part, between Aliveri Bay and Port Petries, it is scarcely 4 miles across from shore to shore. The only towns are Egripos and Karystos; the former situated where the island approaches nearest to the main, and the latter at the southern extremity of the island, at the bottom of a bay bearing the same name.

The island generally is elevated, and contains among its mountains some of the highest in this part of Europe. Mount Delphi rises on the eastern shore to the height of 7266 feet above the sea, and its summit is scarcely ever free from snow; Elias of Karystos, at the southern extremity, is 4748 feet high; Mount Khandhili, 4200 feet, and Telethrius, 3100 feet, are both on the western shore north of Egripos. The general formation of these mountains is grey limestone, with much clay slate.

It appears from the map constructed from Captain Copeland's recent survey, that the small peninsula to the north-west, which terminates in Cape Lithada, is mountainous, and contains one elevation, Mount Lithada, which rises to the height of 2837 feet above the sea. A little south of the point where this peninsula joins the mass of the island, and on the west coast opposite to Bœotia, is Mount Telethrius, with some hot springs near its base. From Telethrius the mountains spread out north-east to Cape Amoni, the most north-eastern point of the island, and eastward to the coast, filling the northern part of the island, and containing several elevations above 2000 feet. Along the northern coast of the island, opposite to Thessaly, and stretching at the base of this mountain group, is the fertile and extensive plain of Oreos, the antient Hestiæotis. South of Telethrius there is high land, with some interruptions, along the west coast as far as Cape Politika: within these limits is Mount Khandhili, near the coast, and another mountain 2694 feet high. Between Cape Politika and Egripos, and extending several miles inland, is the fertile plain of Egripos, bounded on the north and north-east by the high mountains which extend to the eastern coast. The centre of this mountain mass is Delphi, already mentioned, and it contains several other elevations which are between 4000 and 5000 feet. Between the mountains which we have described as occupying the north part of the island and the mass of which Delphi is the centre is the small plain of Mandhoudi on the east coast of the island. South of the narrow channel on which Egripos is situated there is a tract of low land along the Bay of Vathia, backed by the range of Mount Vathia (3821 feet), which appears to be separated by a depression from the group of Delphi, and forms part of the south-east boundary of the plain of Egripos. Farther south and near the west coast there is also the plain of Aliveri. The rest of the island south of Aliveri, along the west coast, and the whole of the eastern coast from the plain of Mandhoudi, appears to be mountainous. The southern extremity of the island is filled by the mass of Mount Elias (4748 feet), which presents to the Archipelago an iron-bound and dangerous coast.

To the southward the plains are generally cultivated with corn and olives, but those to the northward, called the Plains of Oreos, are more particularly devoted to the vine, from which a light red wine is made, which is the common beverage of the Greeks, and forms a staple article of trade. The wine is kept in pig-skins, well coated with resin, which communicates its unpleasant flavour to the contents, which otherwise would not be unpalatable. A deleterious ardent spirit is distilled from the husks of the grapes. Cotton is also planted more to the northward.

On the shores of the Bay of Oreos are some ruins on an eminence, apparently only a military post; a few huts now surround its base, but about two miles in the interior is a large village called Xero Chori, or dry village.

The island is not populous: it is conjectured to contain between 60,000 and 70,000 inhabitants, nearly all Greeks. The villages are few, and, as is the case every where in the Archipelago, built at some distance from the beach, generally on an elevation difficult of access. This precaution has been taken on account of the numerous depredations of the pirates, who were accustomed to land, sack a village, and embark before morning, so that unless the place were tolerably large and populous, there was no safety for life or property.

The passage between Thessaly and Eubœa, called the Trikiri Channel, from the town of that name at the eastern entrance to the Gulf of Volo, is about 4 miles in average width; the narrowest part, which is towards the western extreme, is not quite 1½ mile; the depth of water is regular, steep from both shores, and decreasing gradually from about 50 fathoms at the entrance to 30 towards the western end of the Negropont, off which lie some small rocky islands called Lithada Islands. Passing those islands, and turning to the southward, is the Gulf of Talanda, so called from the town of that name on the Bœotian shore. A remarkable feature in this part of the channel is the amazing depth of water under Mount Telethrius, where, for about 12 or 15 miles, there is no bottom with 220 fathoms within half a mile of the shore; but from this point the water shoals gradually towards Egripos. Towards the north-west extremity of this shore there is a very safe and excellent harbour, now called Port Ghialtra (formerly Port Kalos). There are two villages on its shores, Ghialtra to the westward, and Elypsos to the eastward: near the latter are some antient remains and beautifully sculptured fragments of white marble.

At Cape Therma, the eastern point of the bay, there are hot springs (already mentioned) of the same kind as, but more abundant than, those of Thermopylæ. The water rushes down in a copious stream into the sea, the vapour from which is visible for a considerable distance. Between this point and Egripos there are only three villages, Orovies, Glim, and Politika, all small; but at each of them there are Venetian remains.

In the southern part of the channel there are many islands along the Eubœan shore, which offer good anchorage, more especially among the Petalion Islands, which abound in rabbits, but possess only one spring of fresh water. From Egripos to Karystos there are only two villages, Aliveri and Stura, in the bays called respectively from their names. The bed of this part of the channel is level, but compared with the northern part it is shallow; the general depth is from 35 to 40 fathoms.

The eastern side of Eubœa is a continuation of rocky coast, the high land descending precipitously to the shore with few interruptions of level ground, and this only, as already mentioned, towards the northern part of the island. In the bight between Capes Doro and Octonia, it is an unbroken line of precipitous shore, in which it is scarcely possible to find a ravine sufficiently wide to haul a boat up. Fragments of wreck are found at the height of eighty feet perpendicular, washed up by the heavy sea which a north-east wind throws into this bay. These winds, which always blow very strong, are called by the Greeks 'meltem,' probably a corruption of 'mal tiempo.' In addition to this, the Dardanelles current, preserving the course communicated to it by the direction of that strait, sets strong to the south-west into this bay, and renders it a most dangerous coast: no vessel once embayed here can escape destruction. The current being deflected to the southward sweeps round Cape Doro, frequently at the rate of three miles an hour

Port Petries is the only refuge which this coast offers, and so little has hitherto been known of this shore that even this shelter has only recently been discovered. The village of Koumi, in the bay of that name, is populous, and being celebrated for its wine, has considerable trade in that article by the small caïques, which however are always obliged to be hauled up on the beach for safety. Along the whole extent of this coast, which is upwards of 100 miles, there are only five or six villages near the shore.

The small number of Turks resident in Eubœa left the island on its being surrendered for the purpose of forming an integral part of the Greek kingdom, of which it will not be the least valuable portion. The mountains are said to contain copper, and the marble quarries near Karystos have long been famous. (Strabo, p. 446.) The soil, favoured by the diversities of climate which such a variety of elevation affords, is capable of yielding the productions of tropical as well as of more northern regions, and of supporting an infinitely larger population than now occupies the land. The island abounds in sheep of an excellent breed; but bullocks are scarce, and bred principally for agricultural purposes. In the mountains are abundance of wild boar and deer, and the plains are overrun with hares and rabbits. Among the trees are the olive, oak, fir, chestnut, walnut, mulberry, and oriental plane. In the whole island there is not a stream deserving the name of a river into which the smallest boat could enter, and the inhabitants generally supply themselves with water from wells.

On the summit of Mount Elias (the Oche of Strabo) are the remains of an antient temple, consisting of rude unornamented blocks of limestone, and columns of the same material.

The town of Egripos, the antient Chalcis, the chief town in the island, is in 38° 26′ N. lat., and 23° 37′ E. long., at that part of the island where it is separated from the coast of Bœotia by a narrow channel of only forty yards. It is a walled town, and further defended, where the walls are not washed by the Euripus, by a deep and wide dry ditch. The walls are turreted, slight, and built without regularity, and the numerous winged lions of St. Mark leave no doubt of their Venetian origin. The area enclosed is about 800 yards in length by about 500 in width, which was formerly inhabited exclusively by the Turks; the streets are very narrow, but the houses capacious. The town has several gates constructed with great intricacy; that leading over the Euripus is particularly tortuous, and well defended; the drawbridges have been replaced by frail fixed bridges of logs, to the great peril of passengers.

Another defence is the fort Karababa, on the main, which stands on an eminence about 130 feet high, commencing its rise immediately from the bridge; this may be deemed the citadel of the place, as it overlooks and commands the town. It is a very misshapen structure, of an oblong form, about 400 yards long, and 150 broad. The walls are in some places so low, that an active man might vault on them; they are similar to and coeval with the walls of the town.

Outside the town to the north is a suburb appropriated to trade, and inhabited (when the writer of this article visited the place) by the Greeks and Jews. It consists of one main street about 300 yards in length, from which minor streets branch off. The houses are very small, and the shops are chiefly coffee-houses, or contain general stores and articles of dress: the whole is enclosed in a stockade. There is no commerce except in supplies of fruit and vegetables, principally from Volo, distant about ninety miles to the north, which is all carried on in small boats. The surrounding country is flat and rich, but poorly cultivated. A subsoil of stiff clay offers materials for brick-making and potteries, which are already commenced on a small scale. The market is well supplied, especially with fish; beef is difficult to be procured, but mutton very plentiful; water is scarce, and procured chiefly from wells.

There are facilities for building vessels of large size, as the shore goes off suddenly into deep water; but the inhabitants have advanced no farther yet than the repairs, clumsily executed, of their small boats, which are built generally at some of the Greek islands. The forests on Mount Delphi of fir and oak (the latter of an inferior quality) would supply wood, which might with facility be brought to the town.

Immediately opposite Egripos the land rises suddenly to hills of considerable height, beyond which lie the plains of Thebes, which town is distant about 4 hours, or 12 miles.

The breadth of the Euripus is diminished by a rock in mid-channel, on which a fort is built, dividing it into two channels: that towards the main, though rather the broader, is only practicable for small boats, as there is not more than three feet water at any time. Between the rock and the walls of Egripos is a distance of 33 feet, and the least depth at the highest water is 7 feet. It is here that the extraordinary tides take place for which the Euripus was formerly so noted: at times the water runs as much as eight miles an hour, with a fall under the bridge of about 1½ feet: but what is most singular, is the fact that vessels lying 150 yards from the bridge are not in the least affected by this rapid. It remains but a short time in a quiescent state, changing its direction in a few minutes, and almost immediately resuming its velocity, which is generally from four to five miles an hour either way, its greatest rapidity being however always to the southward. The results of three months' observation, in which the above phænomena were noted, afforded no sufficient data for reducing them to any regularity.

The port to the northward of the bridge, though not capacious, is secure: four or five frigates might moor in it, and it would contain many sail of merchantmen. It is about three-fourths of a mile in depth, decreasing in width from half a mile to the bridge, towards which the water shoals gradually from eleven and twelve fathoms, with a muddy bottom: outside is a good roadstead, with excellent holding-ground. The entrance is clear and free from danger, and although open to the Gulf of Talanda, there is never any sea of consequence; but the gusts which come down off Mount Khandhili are very heavy.

To the southward of the bridge there are two ports; the inner is supposed to be the Port Aulis, where the Grecian fleet assembled previous to the Trojan war. It is about a mile across each way, with six fathoms generally all over it, but a bank of 14 feet in the strait which communicates with the outer port confines its access to vessels of that draught of water. The outer port, which is two and a half miles long and one broad, is joined to Port Aulis by a channel nearly half a mile in length and 400 yards broad, but its outlet to the southward is narrow and intricate. Opposite Egripo Island water may be procured for shipping, though it is not always good or plentiful: the quantity of vegetable substance in the pools which are formed previous to its flowing into the sea renders it frequently unwholesome. A round tower on the eastern point, called the Bourg, is a good mark for the entrance of this port from the southward.

In and about Egripos fragments of antiquity may be seen forming parts of the walls of houses, in common with the grosser materials, like diamonds set in lead. They are generally of white marble, beautifully chiselled; but in no place can any building be traced, or vestiges of walls. The pieces of columns are generally of the Corinthian order, fluted. On Egripo Island there is the appearance of a rude wall traversing the island; and on the mainland, at the southern shore of the channel, between the two ports, where the land rises to about 400 feet, are the remains of Cyclopean walls of very high antiquity. The blocks of stone, which are very massive, rude, and irregular, but fitting closely, are of limestone, and in construction the walls resemble those of Mycenæ. This is most probably the antient Aulis; though there may have been houses at a less elevation and nearer the shore more convenient for commerce, the ascent to these ruins being steep and difficult. The site of Eretria in Eubœa has not been exactly discovered, but it must have been near the west coast and south of Chalcis

Coin of Eretria.

British Museum. Actual size. Silver. Weight $86\frac{5}{10}$ grains.

The country around Egripos is flat for many miles, and very prettily studded with kiosks and small villages. An aqueduct which, commencing at the foot of Mount Delphi,

winds its way to within half a mile of the town, forms a very picturesque object. Though it no longer conveys water, it is by no means in a ruinous condition. It appears to be of Venetian construction, and there are several ruins of that age in the neighbourhood; one especially, called Kastro, situated on the apex of an insulated rise, and presenting towards the sea a steep cliff, resembles the baronial castles on the banks of the Rhine.

Egripos is capable of vast improvements, and of becoming of great commercial importance. Little expense would render the passage of the bridge practicable for vessels of 300 and 400 tons, should it be required, thereby avoiding the passage along the outer coast of the Negropont, which is the worst in the Archipelago, as the Dardanelles current sets on its iron-bound coast, which offers no port whatever, and is a lee-shore in the strong and prevailing north-east winds.

From Egripos there is a carriage road to Karystos, at the southern extremity of the island.

History of Eubœa.—The first inhabitants of this island were probably a Pelasgic race, which is said to have occupied, before the historical times, most of the islands of the Ægean Sea. The Dryopes from Mount Œta were said to have founded Carystus and Styra (Herodotus, viii. 46; Thucyd. vii. 57); and the Athenians founded Chalcis and Eretria, before the siege of Troy. Homer (*Iliad*, ii. 536) calls the inhabitants of Eubœa by the name Abantes, and mentions them as having taken a distinguished part in the expedition against Troy. The Hestiæots were said to be a colony of the Perrhœbi, a Pelasgic tribe: but the Athenians appear to have been from a very remote epoch the principal colonizers of Eubœa. At the dawn of the historical times we find Chalcis and Eretria, two independent but allied towns, which had advanced to a high state of prosperity, holding dominion over the islands of Andros, Tenos, and Ceos, and sending colonies to the coasts of Macedonia and Thrace, as well as to the shores of Italy and Sicily. Naxus, the first Greek settlement in Sicily, and Cuma, one of the oldest in Italy, were colonies of Chalcis. Eretria and Chalcis however quarrelled, and Thucydides (i. 15) mentions the war between the two states as one of the oldest wars on record among the Greeks. This war however was not one of extermination; and we find in the sixth century B.C. the two communities still flourishing, under the government of their Hippobotæ, or wealthier citizens. Unfortunately for them, they co-operated with Cleomenes in his invasion of Attica, which followed the expulsion of the Pisistratidæ, in consequence of which, after the Athenians had repulsed Cleomenes, they invaded Eubœa, about 506 B.C., defeated the Bœotians, who had come to the assistance of Chalcis; and having taken the latter city, they punished it severely, put many of the citizens in fetters, until they ransomed themselves, confiscated all the property of the Hippobotæ, and gave their lands to Athenian colonists, whom they sent over to the island to the number of 4000 (Herodotus, v. 77). Eubœa now became in great measure a dependency of Athens. Afterwards, the Eubœans, together with the Athenians, sent assistance to the Ionians of Asia in their war against Darius Hystaspes; and their troops were among those which burnt Sardes (499 B.C.). The first invasion of Greece was the consequence of that expedition. The Satraps, Datis and Artaphernes, landed in Eubœa with an immense force, completely destroyed Eretria, and sent its inhabitants as slaves into Asia. The Persians then crossed over into Attica, where they were defeated at the battle of Marathon. In the subsequent expedition of Xerxes, Chalcis and other towns of Eubœa manned ships, which, uniting with the rest of the Greek fleet, fought with the Persians at Artemisium. The Hestiæots alone favoured the Persians. After the end of the Persian war we find the Athenians under Cimon, the son of Miltiades, making war in Eubœa against the Carystians, who had revolted, and reducing them to subjection. A general revolt of Eubœa against Athens broke out in 445 B.C., but Pericles, with 5000 regular troops, marched into the island, and recovered possession of it: the towns of Eubœa were reduced to the condition of tributaries to Athens, and an Athenian colony was settled at Oreus in the territory of the Hestiæots, which was the fertile plain on the north coast of the island. This island was of great importance to the Athenians; it furnished them with corn, supplied them with horses, and was considered of more value to them than all their other colonies put together. During the Peloponnesian war, after the defeat of the Athenians in Sicily, another general revol of Eubœa took place, and the island placed itself under the protection of Lacedæmon, but afterwards returned to the Athenian allegiance, when Athens had recovered its independence; and from that time its four principal towns, Chalcis, Eretria (which had been rebuilt near the site of the old town destroyed by the Persians), Carystus, and Oreus, possessed a kind of municipal independence under the supremacy of Athens, which supremacy was at times disputed by the Thebans, who were at last obliged to leave the island. The Eubœans however joined the Theban league against the Spartans, and fought under Epaminondas. In the general prostration into which the principal states of Greece fell after the death of Epaminondas, Eubœa seems to have been left in great measure to itself. Its principal towns came under the rule of chiefs, or tyrants, as they were called, without any interference on the part of the Athenians. About 350 B.C. Callias and Taurosthenes, sons of the late tyrant Mnesarchus, who were ruling in Chalcis, made overtures to Philip of Macedon, in order to have his assistance in subduing the rest of the island, an opportunity which was eagerly seized by Philip. Plutarch, who was at the same time tyrant of Eretria, applied to the Athenians to check Philip's interference. The Athenians sent an expedition under Phocian, who defeated the Chalcidians after hard fighting; but this led to no favourable result, as Callias remained in possession of Chalcis, and the Macedonian influence was established over the island. While Alexander was absent in his Persian wars, the Chalcidians increased and improved their fortifications, which extended to the main-land over the bridge they had built across the Euripus. When the Romans began to extend their influence to Greece, Chalcis and the other towns of Eubœa contracted alliance with Rome, and they remained steadfast to that alliance during the Ætolian war. (Livy, xxxv. 37. 39.) Chalcis afterwards submitted to Antiochus. (Livy, xxxv. 50, 51.) In the Achæan war, after the defeat at Corinth, Chalcis was taken and destroyed by the Romans, and the whole island fell under the dominion of Rome. It then gradually declined in population and importance; and Pausanias and Dion speak of its fallen state under the emperors.

In the dismemberment of the eastern empire by the Latins or Franks the Venetians obtained possession of Eubœa, which they called Negropont, a barbarous name, probably derived from the town of Egripos, a corruption of Euripus, built on the ruins of Chalcis, and from the word 'ponte,' meaning the bridge which united it to the main land. The Venetians lost the island in 1470, when the Turks took the capital, Negropont, and massacred all the inhabitants. The Venetian doge and general Morosini blockaded it in 1688, but after a murderous siege he was obliged to re-embark with great loss. The people of Eubœa took part in the last revolt of the Greeks against the Turks, and the island now forms part of the new kingdom of Greece.

EUCALY'PTUS, a genus of New Holland plants, consisting of lofty trees, with a volatile aromatic oily secretion in their leaves and a large quantity of astringent resinous matter in their bark. They belong to the alternate-leaved division of Myrtaceæ, and are generically known among those plants by their corolla being absent, and the limb of their calyx consolidated into a hemispherical or conical cap, which is thrown off when the stamens expand.

This genus occurs in the Malayan Archipelago, but is chiefly Australian, and, together with the leafless Acacias, gives a most remarkable character to the scenery. The species exist in great profusion, and form the largest trees in the forests of that part of the world. A modern writer upon the plants of Van Diemen's Land says that Eucalyptus seems as if it had taken undisturbed possession of those Australian regions, clothing as it does with a stupendous mantle the surface both of Van Diemen's

Land and New Holland, while the intermixture of other plants which this lordly tribe permits is, compared with its own great extent, but small and partial. Wherever you go, one species or other is constantly before you.

No trees in the world so constantly or rapidly arrive at gigantic dimensions: they often become hollow, and are then used by the traveller as roomy places of shelter at night. Frazer found a hollow Eucalyptus at Moreton Bay, used by the natives as a cemetery. Even at Swan River, where, according to the report of Frazer, the species are stunted, they also attain a huge size, as is proved by what that traveller says of the Angophoras, which he terms 'magnificent' and 'gigantic,' and which, in fact, are Eucalyptus calophylla. A height of 150 ft., and a girth of from 25 to 50 are not uncommon dimensions of these trees. Their timber is represented as highly useful for domestic and other purposes; being so soft at first as to render the felling, splitting, and sawing up of the tree when green a very easy process, and when thorougly dry becoming as hard as oak. Their bark is often extremely hard, whence some species, especially E. resinifera, are called iron-bark trees by the colonists. The blue gum-tree and some others have the singular property of throwing it off in white or grey longitudinal strips or ribands, which, hanging down from the branches, have a singular effect in the woods.

In many species the leaves are so variable in their form and other characters at different ages of the tree, or in different situations, that it is a matter of difficulty to know how they are to be botanically distinguished from each other; and in fact the subject of the distinction of species has hardly yet been taken up, no botanist feeling competent to undertake the task without some personal acquaintance with the plants in a native state. The leaves, instead of presenting one of their surfaces to the sky and the other to the earth, as is the case with the trees of Europe, are often arranged with their faces vertical, so that each side is equally exposed to light.

Gum-tree is the universal name among the colonists for a Eucalyptus, and has arisen from the large quantity of an astringent gum-like juice, resembling gum Kino in its qualities, which all the species yield. In cutting down E. robusta, Mr. Backhouse says that 'we often find large cavities between the annual concentric circles of the trunk, filled with a most beautiful red or rich vermilion-coloured liquid gum, which flows out as soon as the saw has afforded it an opening. The gum yielded by E. resinifera is considered by druggists as not in the least inferior to the Kino which the Pterocarpus or Red Saunders wood of India produces.' (*Companion to the Botan. Magazine*, vol. i. p. 69.) At Moreton Bay and in Van Diemen's Land a kind of manna is yielded by certain species. It appears in the form of an exudation, which coagulates and drops from the leaves to the ground in small white particles, often as large as an almond, and with a sweet agreeable taste.

Upon the whole this genus must be considered the most important that New Holland produces. As it occurs so far to the south as Van Diemen's Land, it is almost certain that it might be naturalized in Devonshire, Cornwall, and on the west of Ireland. Even in the neighbourhood of London certain kinds bear moderate winters without shelter, especially E. pulverulenta.

It is very much to be regretted that some settled nomenclature is not introduced, for the colonists apply the same names to different species in different parts of the country; this renders it difficult to tell of what they are speaking. As far as we can collect the evidence, it appears that the following are, or should be, the botanical species to which the colonial names belong:—

Blue Gum of Port Jackson	E. piperita
Ditto of Hobart Town	E. globulus
Stringy Bark . .	E. robusta
Iron Bark . .	E. resinifera
Kino Gum . .	Ditto
Peppermint Tree . .	E. piperita
Weeping Gum of Van Diemen's Land . .	Uncertain
Mountain Blue Gum of ditto	Ditto
Black Gum of ditto	Ditto
Black-budded Gum of ditto	Ditto
Cider Tree of ditto	Ditto
Manna Gum of ditto	Ditto
Ditto of Moreton Bay .	E. Manna, *Cunn.*
Blood-wood of Port Jackson .	E. corymbosa
White Gum of Van Diemen's Land	E. resinifera
Ditto of Moreton Bay	E. subulata, *Cunn.*
Ditto of the S.W. Interior	E. Leucadendron, *Cunn.*

EU'CHARIS. [BERÖE, vol. iv., p. 318; CILIOGRADA, vol. vii., p. 165.]

EUCHARIST (εὐχαριστία, thanksgiving) is a Greek name of the Christian sacramental act otherwise called the Communion, or the Lord's Supper; and, in contradistinction from these appellations, it particularly expresses the idea of thankfully commemorating the mediatorial sacrifice of Christ; or, according to others, the name was assigned in reference to the fact that, when Jesus enjoined the observance of the rite, he gave thanks.

An elaborate account of the history and doctrines of the Eucharist is given in the learned dissertations on the subject by bishop Patrick, Dr. Waterland, and numerous other writers, of whom a list is furnished in Watt's *Bibliotheca Britannica.* (Cave's *Primitive Christianity*, part ii., c. 11; Bingham's *Origines Ecclesiasticæ;* Claude, *On the Eucharist*, fol., 1684; *Traité de la Cène du Seigneur*, fol., 1635; *Traité de l'Euchariste*, par Cardinal du Perron, fol., 1633.) [COMMUNION.]

EUCHYSIDERITE (*Achmite*), a mineral which occurs crystallized. Primary form, an oblique rhombic prism, of same cleavage and measurements as pyroxene. Colour brownish-black. Lustre vitreous. Nearly opaque. Sp. gr. 3·34. Hardness 6·0,6·5. Streak, yellowish-grey. Fracture, imperfect conchoidal.

It occurs in Norway. Before the blow-pipe alone, readily fuses into a brilliant black globule; with borax forms a coloured glass.

According to Berzelius it consists of—

Silica . . .	55.25
Oxide of iron . .	31.25
Soda . . .	10.40
Lime . . .	0.72
Oxide of manganese	1.08
	99.70

EUCLASE, a crystalled mineral, the primary form of which is an oblique rhombic prism. It is either colourless and nearly transparent, blue, or pale bluish-green; it refracts doubly; the lustre is vitreous. Hardness 7·5; sp. gr. 3·098. Cleavage very distinct, parallel to the oblique diagonal, but indistinct parallel to the terminal plane and horizontal diagonal. The fracture is uneven, and the streak white.

It was first found in Peru, but has since been met with in detached crystals in alluvial ground in Brazil.

According to Berzelius it consists of—

Glucina . .	21.78
Silica . . .	43.32
Alumina . .	30.56
Oxide of Iron .	2.22
Oxide of Tin .	0.70
	99.58

EUCLID, the Geometrician. [GEOMETRY OF THE GREEKS.]

EUCLID (Εὐκλείδης) of Megara is said to be a different person from the geometrician of the same name. He was a scholar of Socrates, and the founder of the school called the Megaric, which may be considered as the predecessor of the Sceptical school of a later date. This school was distinguished by its dialectic subtlety, by which contradictory propositions could be proved, the consequence of which was universal doubt. The Supreme Good, according to Euclid, was always the same and unchangeable. He wrote six dialogues, which are lost. (See *De Megaricorum Doctrina ejusque apud Platonem et Aristotelem vestigiis*, Ferd. Deycks, Bonn, 1827, 8vo.)

EUCRA'TEA. [CELLARICEA, vol. vi., p. 405.]

EU'DEA. [SPONGIDÆ.]

EUDIO'METER, an instrument invented by Dr. Priestley, and originally employed by him in ascertaining the goodness of atmospheric air obtained from various places and under different circumstances. By the use of this instrument and the modifications which it has received, it has been ascertained that the air is liable to no essential variation of composition except such as arises from local and temporary causes.

The use of the eudiometer, termed eudiometry, has, since its original contrivance, been extended to all gaseous mixtures, but especially to determining the quantity of oxygen which they contain when resulting from the operations of analysis; and it is an essential instrument in the chemical

investigation of bodies, not merely such as are naturally gaseous, but which become so by the changes to which they are subjected during chemical research.

The principle upon which the use of the eudiometer depends, so far as atmospheric air and oxygen gas are concerned, is that of exposing them to the action of some substance, whether solid, fluid, or gaseous, which, on account of its affinity for oxygen, combines with it and leaves the gases with which it is mixed unacted upon.

The eudiometer invented by Dr. Priestley arose from and was connected with his great discovery of oxygen gas and the fact which he ascertained of its absorption by another gas, which he called nitrous air, since called by various other names, as nitrous gas, deutoxide of azote, binoxide of nitrogen, and nitric oxide gas.

This gas may be considered as nitric acid deprived of a large portion of its oxygen, which is effected by dissolving a metal in it, as, for example, copper, silver, or mercury, &c.; and of these the last mentioned is said to yield the gas in the greatest purity. The nitric oxide thus obtained being disposed to regain the oxygen which the metal has taken from it, absorbs it with great facility from all such gaseous mixtures as contain it; the evidences of its action are the formation of a red vapour, condensation of volume, and the reproduction of nitric acid; and the quantity of oxygen absorbed is determined by the degree of condensation which is produced by its action.

Dr. Priestley's method was extremely simple: he took a phial capable of holding about an ounce of water, filled it with water, and displaced it with atmospheric air, or with the gaseous mixture to be examined; the volume of this being noted, it was transferred, over water, into an air-jar about an inch and a half in diameter. An equal volume of nitric oxide was added to it, and they remained together for about two minutes: if the diminution was very considerable, another volume of nitric oxide was added. When this part of the process was over, the gas was transferred to a glass tube about two feet long, one-third of an inch in diameter, and graduated into 10ths and 100ths. After noting the volume of the gas, the result was expressed in measures and decimal parts; thus, when equal volumes of common air and nitric oxide were mixed, and they afterwards occupied the space of one volume and two-tenths, Dr. Priestley, in speaking of the air so tried, said the measures of the test were 1·2, or the standard of the air was 1·2.

Although Dr. Priestley determined the volumes of oxygen and nitric oxide required for mutual saturation, he appears mostly, if not entirely, to have confined his eudiometrical operations to comparing the results of them with those on atmospheric air; consequently, although what he calls *the standard* was learnt by his process, the exact quantity of oxygen which the mixture contained was not determined by it.

Numerous attempts have been made by chemical philosophers of the greatest eminence to render the eudiometrical application exact and certain, and if this could be effected, it would be rendered an extremely valuable method on account of the rapidity of its action. Omitting however all notice of the modifications which have been proposed by Cavendish, Fontana, Ingenhouz, Sardinani, &c., we may observe, that while both Dalton and Gay-Lussac imagined that they had removed the uncertainty of the process, the late Dr. Henry admits that he placed but little reliance upon it, and Dr. Thomson states that he has abandoned it altogether, excepting as far as it serves to indicate the presence or absence of oxygen gas in a gaseous residue under examination.

A very different and certainly an improved method, though rather an operose one, of employing nitric oxide was adopted by Davy. Dr. Priestley discovered that a solution of sulphate of iron is capable of dissolving nitric oxide gas, and that in this state it retains its power of combining with and condensing oxygen gas. It is prepared by passing the nitric oxide through the solution of sulphate; as the gas is absorbed the solution becomes of a deep olive brown, and when the impregnation is completed it appears opaque and almost black.

The instruments necessary for ascertaining the composition of the atmosphere by means of this solution consist simply of a small graduated tube divided into 100 parts, and greatest at the open end, and of a vessel for containing the fluid.

The tube, after being filled with the gaseous mixture to be examined, is introduced into the solution, and that the action may be more rapid, gently moved from a perpendicular towards a horizontal position. Under these circumstances the gas is rapidly diminished; and in consequence of the dark colour of the fluid, it is very easy to observe the degree of absorption; in a few seconds the experiment is completed, and the whole of the oxygen is condensed.

The period of the greatest diminution is to be accurately noted; for shortly after this it begins gradually to increase. Davy states that the impregnated muriate of iron (chloride) acts more rapidly than the sulphate.

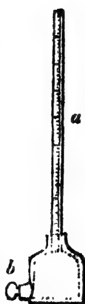
It is to be observed that this process is not applicable merely to the analysis of the air. It was employed by Allen and Pepys in their laborious and accurate experiments on respiration; and they added a simple solution of sulphate of iron to the residual gas, evidently for the purpose of separating any nitric oxide gas which might have escaped from the solution after arriving at the point of greatest condensation.

The eudiometer next to be mentioned is that invented by Scheele, which was probably the first proposed after Dr. Priestley's. This was a graduated glass tube containing a certain volume of air, which was exposed to a mixture of sulphur and iron-filings made into a paste with water. Although the oxygen was absorbed and the azote left by this operation, yet the process was not to be relied upon, for, by the formation of sulphuric acid, which occurred by the oxidizement of the sulphur, the iron was acted upon, and water being decomposed, its hydrogen was evolved, and interfered with the results of the operation.

This plan, however imperfect, had the merit of simplicity, for the quantity of oxygen absorbed was determined at once by deducting the volume of the residual gas from that of the whole quantity submitted to experiment.

De Marté, instead of using sulphur and iron, employed a solution of sulphuret of potassium prepared by dissolving sulphur in a solution of potash. It is stated that this solution when newly prepared absorbs a small portion of azotic gas; but the fallacy arising from this source is readily obviated by agitating the solution for a short time with a little atmospheric air previously to using it, by which it is saturated with azote. A tube divided into 100 parts and immersed in the solution is sufficient for the use of it.

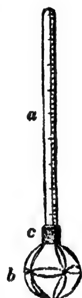
Guyton employed sulphuret of potassium also in his eudiometer, but he used it in a solid state, and applied heat to expedite its action. In this case, as when the solution is used, both the sulphur and potassium are oxidized, and the result is sulphate of potash. It has been objected, and probably with reason, to this eudiometer, that sulphuretted hydrogen was elicited by the action of the heat upon the sulphuret. A description of this eudiometer, which has been but little used, is given in *Nicholson's Journal*, 4to., vol. i.



The eudiometer of Seguin is a glass tube, about an inch in diameter, eight inches long, and open at one end. It is to be filled with and inverted in mercury; a small piece of phosphorus is then put under the open end of the tube, and by its lightness it immediately rises to the top of it, where it is to be melted by the approach of a red-hot iron. A measured portion of the gas to be examined is then to be passed into the tube; the phosphorus inflames on each addition of the gas, and the mercury rises, owing to the condensation of the oxygen. When all the gas under examination has been thrown up into the tube, the hot iron is again used to ensure the completion of the process: the quantity of the residual gas is determined by transferring it into a graduated tube, and the difference between the quantity submitted to experiment and that left after it indicates that of the oxygen absorbed.

In this operation, owing to the affinity existing between the phosphorus and the oxygen, they combine and form phosphoric acid: it is however stated that the azote dissolves a small quantity of phosphorus, and that, owing to the expansion which this occasions, about $\frac{1}{40}$ of the volume of the azotic gas is to be deducted.

Berthollet also employed phosphorus in his eudiometer, but instead of heating it, as in the above-described method, he allowed combination to take place between it and the oxygen, by what is termed slow combustion. He exposed a stick of phosphorus fastened to a glass rod in a narrow graduated glass vessel, filled with air, and standing over water: the phosphorus immediately begins to act on the oxygen of the air, as shown by the formation of the white vapour of phosphoric or phosphorous acid; but this occurs without visible combustion: in six or eight hours the whole of the oxygen disappears, and its quantity is, of course,



immediately apparent, making the deduction above stated from the azotic gas.

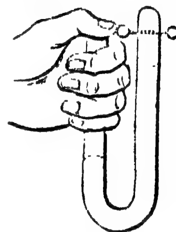
Dr. Hope's eudiometer is represented in the annexed figure. It is used with a solution either of sulphate of iron impregnated with nitric oxide or with solution of sulphuret of potassium. This eudiometer consists of a small bottle, capable of holding about three ounces, for containing the eudiometric fluid, and it is perforated and furnished with a stopper at *b*. Into the neck of the bottle a hollow graduated tube, *a*, closed at the upper end, is accurately fitted by grinding; it holds precisely a cubic inch, and is divided into 100 equal parts. To use the apparatus, the bottle is first to be filled with the solution to be employed, and covering the mouth with a flat piece of glass, it is to be immersed in water; the glass being then removed, the open end of the tube containing the gas to be examined is to be inserted.

The instrument being removed from the water, is to be inverted. The gas ascending into the bottle, it is to be brought into thorough contact with the liquid by brisk agitation, by which absorption of gas occurs; to supply its place the stopper at *b* is removed under water, a quantity of which rushes into the bottle; the stopper is then replaced, and these operations are alternately renewed, till no further diminution takes place; the tube *a* is then withdrawn, the neck of the bottle being in water, and it is held inverted for a short time, and the diminution is then measured by the graduated scale.

Dr. Henry has pointed out some difficulties attendant upon the use of this eudiometer, to obviate which he has substituted a caoutchouc bottle for the glass one, as shown in the annexed figure at *b*. The tube *a* is accurately ground into a short piece of very strong tube of wider bore, as shown at *c*, the outer surface of which is made rough by grinding, and shaped as represented, that it may more effectually retain the neck of the elastic bottle when fixed by waxed thread. This instrument is used, in every respect, in the same manner as Dr. Hope's. The only difficulty is in returning the whole of the residuary gas into the tube, but the art of doing this is readily acquired by practice.

Pepys has contrived a eudiometer, in which a caoutchouc bottle is employed as in Dr. Henry's. This instrument, from the inventor's statement, appears to be susceptible of great accuracy; for he states that he is able to measure an absorption of only $\frac{1}{1000}$ of the gas employed. For an account of this eudiometer, and of some experiments performed with it, see *Phil. Trans.*, 1807. The parts are too numerous for us to insert figures of, and without them a description would be scarcely intelligible.

Having now described the use of nitric oxide, sulphuret of potassium, and phosphorus, as eudiometrical substances, and noticed the more important instruments in which they are employed, we shall notice the eudiometer of Volta, and the eudiometric body which he made use of.



Volta's method of determining the composition of atmospheric air, or of the quantity of oxygen contained in gaseous mixtures, is by means of combustion with a known volume of hydrogen gas; for it having been ascertained that when a mixture of oxygen and hydrogen gases is fired, one-third of the diminution is owing to the condensation of oxygen, we have only to observe the measure of the contraction of volume to ascertain that of the oxygen which was present. Of Volta's eudiometer various modifications have been proposed, all agreeing however in the principle above mentioned. According to Berzelius, that invented by Mitscherlich is to be preferred, on account of the simplicity of its construction and the accuracy of its results. We shall therefore describe it instead of the original one, and it will at once occur to the chemical reader that it is a slight modification of Priestley's and Cavendish's detonating tubes.

This instrument, as represented by the annexed figure, consists of a very thick glass tube from 18 to 24 inches long, and about four lines internal diameter; it is graduated, open at one end, and closed at the other. Near the top A the tube is perforated with platinum wires, placed at such a distance as readily to allow of the passage of the electric spark between them, and externally hooked; near the orifice, B, the tube is laterally perforated and furnished with a glass cock, which is shut after filling the tube with the gas to be examined: this is, of course, to prevent the loss of gas by the expansion accompanying the detonation by the spark. When this is over, the cock is turned under either water or mercury, and the fluid rising in the tube, the condensation is exactly noted by bringing the fluid within and without the tube to the same level.

Another variety of Volta's eudiometer is represented by the opposite figure. It is more simple in its construction than the foregoing, but less certain in its results, on account of the escape of gas which occurs if it be not immersed sufficiently deep in water or mercury: it is a modification of an instrument invented by Dr. Priestley. The only additional explanation required is, that A is a moveable metallic wire with a knob at the end, which is raised near enough to the knob at the top of the instrument to allow of the passage of the electrical spark.

Dr. Ure has also contrived a modification of Volta's eudiometer, which renders the experiment easy of performance by a single person. This instrument is shown by the figure. It consists of a glass siphon, having an interior diameter of from 2-10ths to 4-10ths of an inch; its legs are nearly of equal length, each being from six to nine inches long. The open extremity is slightly funnel-shaped; the other is hermetically sealed, and has two platinum wires inserted; the legs are about one-fourth to one-half an inch asunder. The instrument having been graduated, it is to be filled with water or mercury, and the gas transferred into it in the ordinary manner; then being upright, part of the fluid in the open leg is displaced by inserting a glass rod, or in some other manner. The open leg ought to contain at least two inches of air between the thumb and the mercury: this atmospheric column serves as a recoil-spring, enabling the operator to explode considerable quantities without inconvenience or danger. The open leg being grasped by the hand, the thumb is to be placed lightly over the aperture, so as to close it, and at the same time to touch one of the wires; a spark taken from the conductor to the other wire passes through the gas, inflaming it, and is conducted off by the thumb and hand. The gas in expanding depresses the fluid beneath it, whilst, as already noticed, the air in the part inclosed by the thumb acts as a spring to restrain the violence of the explosion. If a charge from a jar is to be passed, then the thumb must not be allowed to touch the wire whilst closing the aperture. When the jar is charged, the wire connected with the outer coating is first to be hooked upon the eudiometer wire nearest the thumb, and securely retained there, so as not to slip during the experiment; and then the knob of the jar is to be brought to the other wire and the gas inflamed.

After explosion, when the condensation of volume ensues, the thumb will feel pressed down to the orifice by the superincumbent atmosphere. On gradually sliding the finger to one side and admitting the air, the mercurial column in the sealed leg will rise more or less above that in the other; mercury is then to be poured in till the equilibrium is restored, and the resulting volume of gas is then read off.

Dr. Ure states that with the above instrument he has exploded half a cubic inch of hydrogen mixed with a quarter of a cubic inch of oxygen, as also a bulk nearly equal of an olefiant gas explosive mixture, without any unpleasant concussion or noise.

Dobereiner has suggested a eudiometrical process, founded on his curious discovery of the property which spongy platinum possesses of causing the combination of oxygen and hydrogen gases. In this eudiometer the com-

bination occurs without explosion, and yields results of great accuracy. Dobereiner found that when the spongy platinum was mixed with certain substances, so as to prevent its immediate and explosive action, it caused the oxygen and hydrogen to combine with moderate rapidity. The late Dr. Henry, who performed a most important and accurate series of experiments on this eudiometrical process, recommended a mixture of three parts of spongy platinum and two of fine china clay made into a paste with water and moulded into spherules about the size of a pea; these were fastened to a platinum wire, that they might be removed after the action was over. They should be heated and suffered to cool a short time before use: they suffer no loss of power, and possess the great advantage over the electric spark, that they act upon gaseous mixtures which contain so little oxygen and hydrogen that they cannot be fired. The late Dr. Turner ascertained that it was possible to determine the presence of $\frac{1}{100}$ of hydrogen or oxygen in a gaseous mixture; whereas, when these gases formed $\frac{1}{13}$ of a mixture, they could not be detected by electricity. The effect takes place more rapidly in large than in small tubes.

There are various gases which impede the action of the platinum balls. It appears from the experiments of Dr. Henry, that when the compound combustible gases, mixed with each other, with hydrogen, and with oxygen, are exposed to the balls of platinum, the several gases are not acted upon with equal facility; that next to hydrogen carbonic oxide is most disposed to unite with oxygen, then olefiant gas, and lastly, carburetted hydrogen.

Dr. Henry observed, that the property inherent in certain gases of retarding the action of platinum, when they are added to explosive mixtures of oxygen and hydrogen, is most remarkable in those which possess the strongest attraction for oxygen. Heat occasions the platinum balls to act in many cases in which no combination would occur without it.

In concluding this historical sketch of eudiometers and eudiometry, we repeat an observation already made, viz., that whatever volume of the mixed gases may disappear after detonation or by the action of the spongy platinum, one-third of such portion is to be considered as oxygen and two-thirds as hydrogen, the result of their combination being water, formed of these proportions of its constituent gases.

EUDO'CIA, daughter of Leontius, an Athenian sophist, was called Athenais before her baptism. She was carefully instructed by her father in literature and the sciences. After her father's death, being deprived by her brothers of all share in the inheritance, she repaired to Constantinople, and appealed to Pulcheria, sister of Theodosius II., who was so pleased with her that she induced her brother to marry her, A.D. 421. Eudocia surrounded herself with learned men; but the emperor, through jealousy, dismissed all her court, and had her exiled to Palestine, where she continued to reside after the death of her husband. She there embraced the opinions of Eutyches, and supported by her liberality and influence the monk Theodosius, who forced himself into the see of Jerusalem, after driving away Juvenal, the orthodox bishop, and kept it until he was himself driven away by order of the Emperor Marcianus. Euthymius, called the Saint, by his reasonings brought back Eudocia to the orthodox faith, after which she spent the remainder of her days at Jerusalem, where she died in 460, protesting her innocence of the guilt with which her husband had charged her. Eudocia wrote several works, of which Photius quotes a translation in verse of the first eight books of the Old Testament. There is also a work attributed to her, which was translated into Latin by Echard, and was published under the title of 'Homerici Centones Græce et Latine, interprete Echardo,' Paris, 1578. It is a life of Jesus Christ, composed of lines taken from Homer. Most critics however believe that it is not the work of Eudocia, though Ducange is of the contrary opinion.

EUDOCIA the Younger, daughter of the preceding and of Theodosius II., married Valentinianus III. After the assassination of her husband by Petronius Maximus, she was obliged to marry the usurper. Eudocia, out of indignation and revenge, called in Genseric, king of the Vandals, who came to Italy, plundered Rome, and carried Eudocia to Africa with him. Some years afterwards she was sent back to Constantinople, A.D. 462, where she died.

EUDOCIA, the widow of Constantinus Ducas, married Romanus Diogenes, an officer of distinction, A.D. 1068, and associated him with her on the throne. Three years after, Michael, her son, by means of a revolt, was proclaimed emperor, and caused his mother to be shut up in a convent, where she lived the rest of her life. She left a treatise on the genealogies of the gods and heroes, which displays an extensive acquaintance with the subject. It is printed in Villoison's *Anecdota Græca*, 2 vols., 4to. 1781.

EUDO'RA. [MEDUSA.]

EUDOXUS, a native of Cnidus, a city of Caria, in Asia Minor, and the son of Æschines, flourished about 370 B.C. He studied geometry under Archytas, and afterwards travelled into Egypt to study the sciences under the priests of that country. Diogenes Laertius informs us that he and Plato studied in these schools for about thirteen years; after which Eudoxus came to Athens, and opened a school of his own, which he supported with such reputation that it excited the envy even of Plato himself. Proclus informs us that Euclid very liberally borrowed from the elements of geometry composed by Eudoxus. Cicero calls Eudoxus the greatest astronomer that had ever lived; and we learn from Petronius that he retired to the top of a very high mountain that he might observe the celestial phenomena with more convenience than he could on a plain or in a crowded city. Strabo (p. 119) says that the observatory of Eudoxus was at Cnidus, from which the astronomer saw the star Canopus. Vitruvius (ix. 9) describes a sun-dial constructed by him; and Strabo (p. 390) quotes him as a distinguished mathematician. Nothing of his works remains. He died in the fifty-third year of his age. [ASTRONOMY, p. 531.]

EUDOXUS, of Cyzicus, was sent by Ptolemy VII., of Egypt, on a voyage to India about B.C. 125. (Strabo, p. 98, Casaub.) The passage of Strabo referred to contains an account of his adventures. From this Eudoxus, or another of the name, Strabo derived some materials for his great work (379. 550, &c.).

EUDYALITE, a mineral which occurs both crystallized and massive. The crystals are generally small. The primary form is a rhomboid; the colour is red or brownish-red, and the crystals are faintly translucent or opaque. Lustre vitreous, sometimes dull. Sp. gr. 2·9. Hardness 5·0, 5·5. Streak white. Fracture uneven. The massive varieties are imbedded and amorphous.

It occurs at Kandarluarsuk, in West Greenland.

Before the blow-pipe it fuses into a leek-green scoria.

According to Stromeyer it consists of—

Silica	52·47
Zirconia	10·89
Lime	10·14
Soda	13·92
Oxide of Iron	6·85
Oxide of Manganese	2·57
Muriatic acid	1·03
Water	1·80
	99·67

EUDY'NAMYS. [CUCULIDÆ, CUCULINÆ, vol. viii., pp. 206 and 211.]

EU'DYTES. [DIVERS, vol. ix., p. 37.]

EUGENE, FRANÇOIS DE SAVOIE, commonly called Prince Eugene, was paternally descended, in the third degree, from the ducal house of Savoy, but was a French subject by birth, being a younger son of the Comte de Soissons, and born at Paris, October 18, 1663. He was designed for the church, but having formed a decided preference for a military life, and being also moved by certain wrongs which he conceived to have been done to his family by Louis XIV., and which he deeply resented, he entered the service of the Emperor Leopold. From this time he renounced his allegiance to France, and long after, when his reputation was at its height, rejected the most brilliant offers made by the French government to purchase his return to the service of his native country. His first campaign was against the Turks, at the celebrated siege of Vienna in 1683. Eminent bravery and talent, joined to high birth, ensured him rapid promotion. In 1688-9, on the breaking out of war between France and the Empire, he was employed on a diplomatic mission to the duke of Savoy, and in 1691 was raised to the command of the imperial army in Piedmont. During two campaigns he maintained a decided advantage over the French: in 1693 he was less successful. The duke having returned to the French alliance, we next find Prince Eugene commanding the army in Hungary, where he won a great victory over the Turks at Zenta, on the river Theiss, Sep-

tember 11, 1697. The peace of Carlowitz (1699) closed this scene of action; but a more brilliant one was opened in 1701 by the war of the Spanish succession. During two years Eugene maintained the imperial cause in Italy with honour against superior forces commanded successively by Catinat, Villeroi, and Vendôme, against the last of whom he fought the indecisive battle of Luzara, August 1, 1702, in which the flower of his troops was destroyed. At the end of this campaign he returned to Vienna, and was appointed president of the council of war.

In 1704 he commanded the imperial troops at the battle of Blenheim, August 13, 1704. The successes of the French in Piedmont made it expedient for him to return thither in 1705. He soon restored the duke of Savoy's declining fortunes, and won the decisive battle of Turin, September 7, 1706, after which the French evacuated the country. He was thus set again at liberty to co-operate with Marlborough in 1708, and had a share in the victory of Oudenarde, and in the capture of Lille, the siege of which was entrusted to him, while Marlborough protected his operations. In 1709 he was wounded at the bloody battle of Malplaquet, of which he was the chief adviser, and in which he led the attack upon the left wing. On the death of the Emperor Joseph in 1711, he took an important part in securing the succession to his brother Charles VI., and he visited England at the end of that year, in hope of preventing the secession of England from the alliance. He was received as his services deserved, but made no progress towards his object; for the dismissal of the Whig ministry was soon followed by the congress and peace of Utrecht. The emperor being no party to that treaty, Eugene invaded France in 1712 with little advantage, and it became evident that the interests of the empire would be best consulted by peace: the preliminaries were accordingly signed at Rastadt, March 6, 1714.

In 1716 Prince Eugene again marched against the Turks, and won the battle of Peterwaradin, August 6, against an enormous disproportion of numbers. In the following year he besieged Belgrade with 40,000 men. With troops wasted by disease, pressed by an army of 150,000 men from without and opposed by a powerful garrison from within, he was in the utmost danger, when, with the happy boldness which distinguished him, he seized the right moment, and inflicted a signal defeat on the army which threatened him. Upon this the town surrendered. Peace was concluded in the following year.

He took up his residence at Vienna, honoured and trusted by the emperor, in whose political service he was much employed. In 1733 a fresh quarrel with France called him again to command the imperial army on the banks of the Rhine. This war is said to have been undertaken against his advice: at all events age had diminished his energy: he contented himself with standing on the defensive, and used his influence to effect a reconciliation. Preliminaries of peace were signed at Vienna, October 5, 1735. He died suddenly in that capital, April 21, 1736, aged 73.

As a general, Prince Eugene ranks among the first of his kind, but that kind was not of the highest order of excellence. His name is memorable for no improvements in the *art* of war, neither was he famous for skill in manœuvring or combining the operations of distinct masses upon one object. His characteristics were penetration, quickness of perception, decision, and what usually goes along with them, readiness in amending a fault when made; so that his skill lay rather in making the best of given circumstances than in bending circumstances to his will beforehand. It is said that he always took great pains to learn the character of the general opposed to him. Careless of his own person (he was thirteen times wounded in battle), he was also somewhat prodigal of his soldiers' lives. However, he threw a glory round the Austrian arms such as has never dignified them either before or since.

The best account of his exploits is 'L'Histoire du Prince Eugène,' 5 vols. 12mo., by M. de Maubillon, but published without his name. In English, there is Campbell's Military History of Prince Eugene and the Duke of Marlborough, 2 vols. fol.; and several smaller works. Prince Eugene wrote memoirs of himself, which have been published both in French and English.

EUGE'NIA, a genus of dictyledonous polypetalous plants of the natural order of Myrtaceæ; so named in honour of Prince Eugene of Savoy, who was a patron of botany and horticulture. The genus, as at present constituted, contains nearly 200 species, though numbers have been removed to the genera Nelitris, Jossinia, Myrcia, Sizygium, Caryophyllus, and Jambosa, in which are now contained the Clove tree, the Rose apple, and Jamoon of India, formerly included in Eugenia. This genus is confined to the hot and tropical parts of the world, as Brazil, the West India Islands, and Sierra Leone, and extends from the Moluccas and Ceylon to Silhet and the foot of the Himalayas in Asia.

Eugenia is characterized by having the tube of the calyx of a roundish form and the limb divided into four parts; the petals equal in number, and inserted on the calyx. The stamens are numerous. The ovary 2-3 celled, with several ovules in each. Seeds one or two, roundish and large, with the cotyledons and radicle united into one mass. In habit and inflorescence the species resemble many myrtles. Like the family to which they belong, some of the species of Eugenia secrete a warm volatile oil in their herbaceous parts; abound in tannin; yield good wood; and a few have fruit which is edible, though not very agreeable, from being impregnated with the aroma of the oil.

The most remarkable species of the genus, and one of the few which it is necessary to notice, is the Allspice, Pimento, or Bay-berry tree. This is the Eugenia Pimenta of De Candolle; the Myrtus Pimenta of Linnæus and of the London Pharmacopœia. It is a native of South America and the West India Islands, especially Jamaica, and from being cultivated there is often called Jamaica Pepper. The tree is very handsome, often 30 feet high, and much resembles the Clove tree in the form and appearance of its leaves as well as in habit. The trunk is smooth, and much branched towards the top. The older branches are round, the younger compressed, and the twigs as well as the flower-stalks pubescent; the leaves are petiolate, oblong or oval, smooth, and marked with pellucid dots, forming a dense evergreen foliage; the flower-stalks are both axillary and terminal, and are divided into three-forked panicles; the flowers are small, without show, and conformable in structure to the character of the genus. The berry is spherical and crowned with the persistent calyx; when ripe, smooth, shining, and of a dark purple colour; usually one, occasionally two-celled, containing large roundish seeds.

The Pimenta is cultivated with great care in Jamaica, and abounds especially on the hills on the north side of the island. The trees are formed into regular walks, and begin to bear when three years old, but are not in perfection until they have been planted seven years. They thrive best in rocky lands, or a rich soil having a gravelly bottom. Mr. Bryan Edwards says that a single tree has been known to yield 150 lbs. of the raw fruit, or 100 lbs. of the dried spice; but the crop is uncertain, and plenteous perhaps only once in five years. The tree has been introduced into and flourishes in the southern parts of India.

The berries, being the valuable part of the tree, require care in gathering as well as drying; the processes for which are described by Browne in his 'History of Jamaica,' p. 248. They must be picked when they have arrived at full growth, but before they begin to ripen: they are dried in the sun, on raised boarded floors, and frequently turned during the first and second day; they are then put into sheets, often winnowed, and exposed to the sun until sufficiently dried, which is known by the colour and the rattling of the seeds in the berries. Browne says, 'Such of the berries as come to full maturity do, like many other seeds, lose that aromatic warmth for which they are esteemed, and acquire a taste perfectly like that of Juniper berries, which renders them a very agreeable food for the birds, the most industrious planters of these trees.'

The leaves and bark participate in the warm aromatic properties for which the berries are celebrated, and which have received their name of Allspice from their fragrant odour being thought to resemble that of a mixture of cinnamon, cloves, and nutmeg. Their taste being warm and aromatic makes them useful as a spice in cookery, and a stimulant in medicine.

Eugenia Michelii is a Brazilian species, cultivated in Martinique, whence it is called *Cerisier de Cayenne*, as it yields a small edible fruit.

EUGENIACRINITES. [ENCRINITES, vol. ix., p. 393.] N.B. The Rev. Lansdown Guilding, in his notice of a perfect recent *Encrinus*, found in the Caribbean seas, and which, according to him, comes nearest to the *Stag's* Horn *Encrinite* of Parkinson, says that its capture has enabled him

to settle the point (which way he does not in terms state) as to whether the animal is locomotive or fixed. He gives no detailed description of the species *Encrinus? Milleri*, but speaks of the *Sessile* genera of *Crinoidea*, and says that *E. Milleri* inhabits the Caribbean sea at great depths (in profundis), adhering to *Gorgoniæ*. He describes the *abdomen* of his species as being membranaceous, and situated between the bases of the arms. (*Zool. Journ.*, vol. iv. p. 173.)

EUGENIN, a substance which deposits spontaneously from the distilled water of cloves; it crystallizes in small laminæ, which are colourless, transparent, and pearly, and in time they become yellow: the taste of eugenin is but slight, and the smell much less strong than that of the clove. It is soluble in alcohol and æther in all proportions: by the action of nitric acid, like the oil of cloves, it becomes immediately, even when cold, of a blood-red colour. It is composed of oxygen, hydrogen, and carbon, in the same proportions as constitute the oil of cloves, with one equivalent less of oxygen and hydrogen.

EUGE'NIUS I., a native of Rome, was elected by the Romans, A.D. 654, as successor to Martin I., who had been sent into banishment to the Thracian Chersonesus by order of the Emperor Constans II., who favoured the schism of the Monothelites. Martin dying in the following year, Eugenius continued in dispute with the court of Constantinople till he died in 657, and was succeeded by Vitalianus.

EUGENIUS II., a native of Rome, succeeded Paschas I., A.D. 824, in the midst of great disorder which occurred at Rome owing to the corrupt state of society and mal-administration of that city. To reform these, the emperor, Louis the Good, sent his son Lotharius to Rome, who corrected many abuses which, by the account of Eginhardt and other chroniclers, had grown to an enormous extent. He confirmed the right of electing the pope to the clergy and people of Rome, but under the condition that the pontiff elect should swear fidelity to the emperor before the imperial missus or representative. Eugenius held a council at Rome, in which, among other things, it was decreed that in every episcopal residence, as well as in every country parsonage, there should be a master for teaching the people and explaining the Scriptures. Eugenius died in 827, and was succeeded by Valentinus, who, dying also after a few weeks, was succeeded by Gregory IV.

EUGENIUS III., a native of Pisa, of the Cistertian order, and a disciple of St. Bernard, succeeded, A.D. 1145, Lucius II., who had died of a blow from a stone inflicted in a riot of the Roman people. Arnaldo da Brescia was then preaching his reform at Rome, the senate had declared itself independent of the pope, and Eugenius was obliged to take up his residence at Viterbo. After some fighting and many negotiations between the pope, assisted by the people of Tivoli, and the Romans, Eugenius repaired to France in 1147, and the following year held a council at Rheims. He afterwards returned to Italy, and with the assistance of Roger king of Sicily defeated the Romans, and entered the city, A.D. 1149. New disturbances however arose, which obliged him to take refuge in Campania, where he received of St. Bernard the book *De Consideratione*, the subject of which was advice on his pontifical station and its duties. After having resided some time at Segni he made peace with the Romans, and returned to Rome in 1152. He died the following year, and was succeeded by Anastasius IV. It was under his pontificate that Gratianus, a Benedictine monk at Bologna, compiled his code of canon law called 'Decretum Gratiani,' which greatly favoured the extension of the papal power. [CANON LAW.]

EUGENIUS IV., Gabriele Condulmero, a native of Venice, succeeded Martin V. in March, 1431. His was a most stormy pontificate. He drove away the powerful family of Colonna, including the nephews of the late pope, from Rome, charging them with having enriched themselves at the expense of the papal treasury. Two hundred of their adherents were put to death, and the palaces of the Colonna were plundered; but their party collected troops in the country and besieged Rome. Eugenius, through the assistance of Queen Joanna II. of Naples, defeated the Colonna, and obliged them to sue for peace and surrender several towns and castles they held in the Roman state. He afterwards made war against the various lords of Romagna, who were supported by the Visconti of Milan; and he appointed as his general the patriarch Vitelleschi, a militant prelate, who showed considerable abilities and little scrupulousness in that protracted warfare, by which the pope ultimately recovered a considerable portion of territory. But as Vitelleschi intended to keep Romagna for himself, the pope had him put to death. The famous condottiere Sforza figured in all these broils. But the greatest annoyance to Eugenius proceeded from the council of Basel, which had been convoked by his predecessor, and which protracted its sittings year after year, broaching doctrines very unfavourable to papal supremacy. After solemnly asserting the superiority of the council over the pope, it forbade the creation of new cardinals, all appeals from the council to the pope, suppressed the annates, or payments of one year's income upon benefices, which were a great source of revenue to the papal treasury, and made other important reforms. Eugenius, who had been obliged to escape from Rome in disguise on account of a popular revolt, and had taken up his residence at Bologna, A.D. 1437, now issued a bull dissolving the council, recalling his nuncio who presided at it, and convoking another council at Ferrara. Most of the fathers assembled at Basel refused to submit, and summoned the pope himself to appear before them, to answer the charges of simony, schism, and others; and after a time proceeded against him as contumacious, and deposed him. Eugenius meanwhile had opened in person his new council at Ferrara, in February, 1438, in which, after annulling all the obnoxious decrees of the council of Basel, he launched a bull of excommunication against the bishops who remained in that assembly, which he characterized as a 'satanic conclave, which was spreading the abomination of desolation into the bosom of the church.' The Catholic world was divided between the two councils; that of Basel proceeded to elect a new pope in the person of Amadeus VIII. of Savoy, who assumed the name of Felix V., and was solemnly crowned at Basel. The council of Ferrara in the meantime afforded a novel sight. The Emperor John Paleologus II. came with Joseph, patriarch of Constantinople, and more than twenty Greek bishops, attended by a numerous retinue, and took his seat in the assembly. The object was the reconciliation of the eastern and western churches, which Eugenius had greatly at heart, and to which Paleologus was also favourably inclined, as he wanted the assistance of the powers of western Europe against the Turks. The plague having broken out at Ferrara, the council was removed to Florence. After many theological disputations on the subject of the Holy Ghost, of the primacy of the pope, of purgatory, and other controverted points, the decree of reunion of the two churches was passed, and signed by both parties in July, 1439. The emperor and partiarch returned to Constantinople highly pleased with Eugenius; but the Greeks took offence at the terms of the union, the schism broke out afresh, and the separation of the two churches has continued ever since.

A grave charge against Eugenius is, that he encouraged the Hungarians and Poles to break the peace they had solemnly sworn with the Turks, under pretence that their oaths were not valid without the sanction of the pope; he even sent Cardinal Julian as his nuncio to attend the Christian army. The result was the battle of Varna, 1444, in which the Christians were completely defeated, and King Uladislaus of Poland and Cardinal Julian lost their lives.

Eugenius died at Rome A.D. 1447, after a reign of sixteen years, and in the sixty-fourth year of his age. He left the church in a state of schism between him and his competitor Felix, his own states a prey to war, and all Christendom alarmed at the progress of the Turkish arms. In his last days he is said to have expressed himself weary of agitation, and to have regretted the loss of his former monastic tranquillity before his exaltation. He recommended peace and conciliation to the cardinals assembled around him. He was succeeded by Nicholas V., in favour of whom Felix V. soon after abdicated. The pontificate of Eugenius forms a most stirring and interesting period in the history of Italy and of the church. L'Enfant and Æneas Silvius, afterwards pope, have written the history of the council of Basel. See also the general collections of the councils and Baluze's 'Miscellanios.'

EUKAIRITE, a seleniuret of silver and copper, discovered by Berzelius. It occurs in thin films of a shining lead colour; opaque; its texture is granular; it yields readily to the knife, and acquires a silvery lustre. It occurs in a copper mine in Sweden. Before the blow-pipe it exhales a

strong smell of selenium, and with charcoal fuses into a brittle metallic globule. It consists of—

Selenium	26
Silver	38·93
Copper	23·05
Earthy matter	8·90
Carbonic acid and loss	3·12
	100·

EU'LABES. (Zoology.) [ROLLERS.]

EULA'LIA (Zoology), a genus established by Savigny, and placed by Cuvier among his Dorsibranchiate Annelids. [DORSIBRANCHIATA.]

EULEN-SPIEGEL. [ENGLISH DRAMA, vol. ix., p. 423.]

EULER, LEONARD, a celebrated mathematician of the last century, was born on the 15th of April, 1707, at Basle, in Switzerland; his father, Paul Euler, was the Calvinistic pastor of the neighbouring village of Riechen. He was a man remarkable for unostentatious piety, and imbued with a considerable knowledge of mathematics, which he had acquired under the tuition of James Bernouilli.

After being instructed by his father in analytical science, young Euler was sent to the university of Basle, in which John Bernouilli was at that time professor, and by his rapid progress and decided mathematical genius he so far gained the esteem of his teacher and of the sons, Nicholas and Daniel Bernouilli, that his father was easily dissuaded from his original intention of forming his son into a divine, and wisely allowed him to pursue unshackled the high distinctions then conferred by a profound scientific reputation.

A prize having been proposed by the French Academy of Sciences on the management of vessels at sea, the ambition of Euler, then only nineteen years of age, induced him to attempt an essay, which was received with considerable applause, though the prize was conferred on Bouguer, an old and experienced professor of hydrography.

The Academy of Sciences at St. Petersburg was then rising to a distinguished rank amongst similar institutions in Europe under the fostering patronage of Catherine I., who had invited several philosophers to her capital, among whom were the Bernouillis above mentioned. On the retirement of Daniel Bernouilli, Euler was appointed professor of mathematics under Peter I. in 1733; soon after which he married a Swiss lady named Gsell, by whom he had a numerous family.

His works previous to the date at which we have arrived were, with few exceptions, confined to those mathematical questions arising from the progressive march of the Integral Calculus, which, at that time, caused much emulation in different countries. In general, Euler was far more in his element in the abstruser parts of pure mathematics than in the applied; in many of the latter he was frequently conducted to paradoxical results.

In the memoirs of the Petropolitan Academy, 1729 and 1732, are found several of his memoirs on trajectories, tautochronous curves, the shortest line along a surface between two given points, and on differential equations; besides which he had published at Basle a physical dissertation on sound.

Euler found it convenient at this time to apply himself intensely to study, not more from his natural ardour for the sciences and the incentive of an increasing reputation than from the desire to avoid the political intrigues which, under a suspicious and tyrannical minister, then agitated Russia.

During this interval he published an excellent treatise on mechanics (Petersburg, 1736, 2 vols., 4to.), a treatise on the theory of music, and one on arithmetic, together with numerous papers in the Petersburg Memoirs, chiefly on astronomical and purely mathematical subjects, among which are contained his views on the solution of Isoperimetrical Problems, which embodied the profoundest researches on a matter of great analytical difficulty previous to the discovery of the Calculus of Variations by Lagrange. Upon the fall of Biren he gladly accepted an invitation from the king of Prussia to visit Berlin. When he was introduced to the queen-dowager in 1741, she was so much struck with the paucity of his conversation that on requiring an explanation, he replied that he had just returned from a country where those who spoke were hanged.

The princess of Anhalt-Dessau, being desirous to profit by the presence of Euler in Berlin, requested to be favoured with instructions on the known facts in the physical sciences. To this wish he fully acceded on his return to Petersburg in 1766, by publishing his celebrated work, 'Letters to a German Princess' (3 vols., 8vo., 1768); in which he discusses with clearness the most important truths in mechanics, optics, sound, and physical astronomy, having published previous to this date several isolated treatises and some hundred memoirs touching on every known branch of theoretical and practical mathematics. During his residence in Prussia he was much employed by the enlightened monarch who then governed that kingdom in questions connected with the mint, with navigable canals, &c. In the midst of such varied employments he was not forgetful of the ties which bound him to his native home· having learned his father's death, he went in 1750 to Frankfort to receive his widowed mother, and brought her to Berlin, where she lived until 1761, enjoying with a mother's feeling the glorious distinction to which her son by his talents and indefatigable industry had arrived.

An incident which occurred in 1760 showed how highly Euler was in general esteemed. The Russians having entered Brandenburg, advanced to Charlottenburg, and plundered a farm which belonged to Euler. When General Tottleben was informed who the proprietor was, he ordered immediate reparation to be made to an amount far above the injury, and the Empress Elizabeth presented him with 4000 florins.

In consequence of his unceasing application to study, Euler had the misfortune to lose the sight of one eye in 1735, and in 1766 that of the other; he however continued his valuable researches, some of his family acting as amanuensis, and his powers of memory are said to have been wonderfully increased even in his old age. He accepted the invitation of the empress Catherine II. of Russia to return to Petersburg in 1766, where he would have fallen a victim to an accidental fire which destroyed his house and property in 1771, but for the courageous efforts of a fellow-countryman (M. Grimon), who bore the old man away in his arms. His manuscripts were saved by the exertions of Count Orloff.

On the 7th of September, 1783, after some calculations on the motions of balloons, then newly invented, Euler dined with Lexell, and conversed on the lately-discovered planet Herschel. While playing with his grand-child, who was taking tea, he expired suddenly and without pain.

Euler was twice married in the same family, and had many children and grand-children; his habit of life was strictly religious, the labours of each day being closed with a chapter from the Bible and family prayer. A catalogue of his published and unpublished writings is given at the end of the 2nd volume of his 'Institutiones Calculi Differentialis,' 1787; and to the first is prefixed an eloquent Eloge by Condorcet.

Every useful subject of mathematical research engaged at some time the attention of Euler; and for relaxation he amused himself with questions of pure curiosity, such as the knight's move in chess so as to cover all the squares. His various researches have gone far towards creating the geometry of situation, a subject still imperfectly known. The following is one of the questions which Euler has generalized:—'At Königburg, in Prussia, the river divides into two branches with an island in the middle, connected by seven bridges with the adjoining shores; it was proposed to determine how a man should travel so as to pass over each bridge once and once only.'

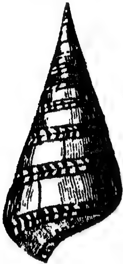
The memoirs of Euler are principally contained in the following works:—'Comment. Acad. Petrop.,' 1729-51; 'Novi Comment. Acad. Petrop.,' 1750-76; 'Nova Acta Acad. Petrop.,' 1777-81; 'Mem. de l'Acad. des Sciences,' 1765, 1778; 'Recueil de l'Acad.,' 1727, &c.; 'Miscell. Beroll.,' tom. vii.; 'Mem. de l'Acad. de Berlin,' 1745-67.

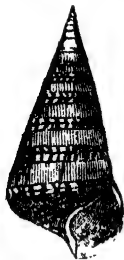
EU'LIMA, a genus of marine Testaceous Gastropods, established by M. Risso.

Generic Character.—*Shell* turreted, acuminated, polished, with many whorls; aperture ovate, acuminated posteriorly; external lip thickened, generally forming numerous obsolete varices. *Operculum* horny, thin, its nucleus anterior.

Mr. G. B. Sowerby, who gives this generic character, says (*Zool. Proc.* 1834) that this genus of marine shells appears to be most nearly related to *Pyramidella* and *Rissoa*. A species, he adds, which has been long known has had the appellation of *Turbo politus* among British Linnean writers; and a fossil species has been placed by Lamarck among the *Bulini*, under the specific name of *B. terebellatus*. Mr. Sowerby separates the genus into the two

divisions below stated, which are characterized by the two species above mentioned; one has a solid *columella*, and the other is deeply umbilicated. All the species, he observes, are remarkable for a brilliant polish externally, and the shells are frequently slightly and somewhat irregularly twisted, apparently in consequence of the very obsolete varices following each other in an irregular line, principally on one side, from the apex towards the aperture. He describes sixteen species, chiefly from Mr. Cuming's collection.





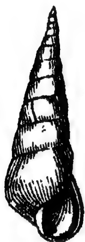
Geographical Distribution.—Wide; principally found, as yet, in warm seas (South and Central America, and Pacific Ocean, Australia) but there are several British species.

Habits.—The species found by Mr. Cuming were dredged or otherwise collected in sandy mud, coarse sand, and coral sand, on mother-of-pearl shells, or on the reefs; at depths (not including the reefs) ranging from six to thirteen fathoms.

a.

Perforated Eulimæ.

Example, *Eulima splendidula.* Shell acuminate-pyramidal, brownish, articulated with white and chestnut near the sutures; umbilicus large; aperture angulated anteriorly. Length 1·45, breadth 0·6 inches. Locality, Saint Elena, South America. Mr. Cuming dredged a single specimen in sandy mud at from six to eight fathoms depth.



Eulima splendidula.

β.

Imperforate Eulimæ.

Example, *Eulima major.* Shell acuminate-pyramidal, opaque, milk-white; external lip subarcuated. Length 1·6 inches, breadth 0·4. Locality, the Island of Tahiti. The largest specimen was found in coral sand on the reefs.

Eulima major.

Fossil Eulimæ.

Mr. G. B. Sowerby says that the fossil species are found in the *calcaire grossier* near Paris.

EULI'MENE. [Branchiopoda, vol. v., p. 343.]

EULY'MENE. [Medusa.]

EUME'DONUS, a genus of brachyurous crustaceans, the first of the *Parthenopians* of M. Milne Edwards, and which, in his opinion, establish in some sort the passage between the *Stenorhynchi*, *Achæus*, on the one side, and *Eurynome*, *Lambrus*, and *Parthenope*, on the other. The form of the carapace is nearly pentagonal as in the latter, but it is, at the same time, thrown forwards, as it were, and scarcely overpasses the line of the feet of the hind pair of limbs, a disposition which recals the construction of the former. The *body* is depressed; the *rostrum*, which is very large and projecting, is only divided towards its extremity; the *eyes* are very short, and their peduncle entirely fills the orbits, which are circular; a character which again approximates these crustaceans to the *Stenorhynchi*: the internal *antennæ* are folded back very obliquely outwards, and the external antennæ are but little developed. The *epistome* is shorter than in the majority of the *Oxyrhynchi*. The *external jaw-feet* present nothing remarkable. In the male the *thoracic feet* of the first pair are large and much longer than the rest: all these are a little compressed, and their third joint is surmounted by a crest, which is not distinctly perceptible on the other joints; the feet of the second pair are rather shorter than those of the third and fifth pair, which are nearly as long as the fourth. The *abdomen* of the male is composed of seven articulations.

Example, *Eumedonus niger*. This small species, the only one known, is of a bronzed black colour, and inhabits the coasts of China. [Parthenope.]

EU'MENES, of Cardia, a town in the Thracian Chersonese, was an important actor in the troubled times which followed the death of Alexander the Great. [Alexander III.; Antipater; Arrhidæus; Perdiccas.] Being early taken into the service of Philip of Macedon, he served him for seven, and Alexander for thirteen years, in the confidential office of secretary. He also displayed great talent for military affairs through the Persian campaigns, and was one of Alexander's favourite and most esteemed officers. After Alexander's death, in the general division of his conquests, Cappadocia, Paphlagonia, and the coast of the Euxine as far east as Trapezus, fell to Eumenes' share. This was an expectancy rather than a provision, for the Macedonian army had passed south of these countries in the march to Persia, and as yet they were unsubdued. Perdiccas, however, took arms to establish Eumenes in his new government, and did so, at the expense of a single battle. To Perdiccas as regent, and after his death to the royal family of Macedon, Eumenes was a faithful ally through good and evil; indeed he is the only one of Alexander's officers in whose conduct any appearance of gratitude or disinterestedness can be traced. When war broke out between Ptolemy and Perdiccas, B.C. 321, he was appointed by the latter to the chief command in Asia Minor between Mount Taurus and the Hellespont (Cor. Nep., c. 3), to resist the expected invasion of Antipater and Craterus. The latter he defeated; but the death of Perdiccas in Egypt threw the balance of power into Antipater's hands, who made a new allotment of the provinces, in which Eumenes was omitted, and Cappadocia given to another. The task of reducing him was assigned to Antigonus, B.C. about 320. The rest of his life was spent in open hostility or doubtful alliance with Antigonus, by whom he was put to death, B.C. 315, as is related in that article, vol. ii., p. 101. Eumenes was an admirable partizan soldier, brave, full of resources, of unbroken spirits. Those parts of Diod. Sic., book xviii., which relate to him, and Plutarch's *Life*, will be read with pleasure by those who are fond of military adventure. Plutarch (*Life of Eumenes*, c. ii.) speaks of some of his letters. The reader may consult also Droysen, *Geschichte der Nachfolger Alexanders*, Hamburg, 1836.

Coin of Eumenes.

British Museum. Actual size. Silver. Weight, 263 grains.

EUME'NIDES (the kind goddesses), a name given to the Erinyes or Furies, a set of goddesses whose business it was to avenge murder upon earth. They were also called Semnæ, or 'venerable goddesses.' The name Erinys was derived from the old Arcadian word *erinuein* (ἐρινύειν), 'to be angry.' (Pausan. viii., 25, 6.) These goddesses appear in the play of Æschylus which bears their name, not only as the instruments of wrath and the pleaders for justice against the matricide Orestes, but also as the promisers of victory, prosperity, and all sorts of blessings to the Athenian people: this mixture of characters is to be explained by the fact that their worship was connected with that of a Demeter Erinys at Thelpusa, in Arcadia, and we have seen elsewhere how the goddess of the earth and its productions was also the goddess of the nether world. [Bacchus; Demeter.] The site of their temple at Athens, where their worship possessed a peculiar importance, was the north-east angle of the Areopagus, at its base. 'There is a wide long chasm there formed, by split rocks, through which we enter a gloomy recess. Here is a fountain of very dark water,'

(Wordsworth's *Athens* and *Attica*, p. 79.) The Athenians sacrificed to the Eumenides, among other victims, black sheep: no wine was mixed up with the libations offered to them, but only oil, honey, and water, in three separate libations, out of different vases. (Soph. *Œd. Col.*, 469, &c) Of the number of these goddesses we have contradictory accounts: in the play of Æschylus it is pretty certain that there were fifteen in the chorus. (Müller's *Eumenides*, § 10.) Every question connected with these divinities is accurately and satisfactorily discussed by Müller in the second essay at the end of his edition of the *Eumenides*, § 77—93.

EUMOLPUS, EUMOLPIDÆ. [ELEUSIS.]

EUMORPHUS, a genus of coleopterous insects belonging to the section *Trimeri* of Latreille, and being the typical genus of the family *Fungicolæ*. These insects are characterized by having the antennæ longer than the head and thorax, the body oval, and the thorax irregularly square; the maxillary palpi filiform, or slightly thickened at the end, but not terminated by a large process as in some genera: the last joint of the tarsus is always deeply divided into two lobes.

Latreille (*Règne Animal*) divides the genus Eumorphus into several sub-genera. Some of the species have the third joint of the antennæ much longer than any of the other joints: these form the genus Eumorphus (proper), in which the antennæ are club-shaped. All the species are natives of America or the East Indies. Ex.: Eumorphus immarginatus. (Latr. *Gener. Crust. et Insect.*, tab. xi., fig. 12.)

2nd Sub-genus, *Dapsus* (Ziég.). Some of the species have the antennæ club-shaped, as in Eumorphus proper, but straighter and more elongated, and with the joints bent laterally: among these, Eumorphus Kirbyanus (Latr.) is now placed. In other species of Dapsus the third joint of the antennæ is not longer than any of the others. Many of the species of Dapsus are indigenous in Europe, living in different fungi, whence the name of the family (Fungicolæ). Some of these insects are also found under the bark of the birch and other trees. 3rd Sub-genus, *Endomychus* (Fab.) has the three last joints of the antennæ bent laterally, larger than the others, and forming a triangular club-shaped mass. 4th Sub-genus, *Lycoperdina* (Latr.) has the maxillary palpi filiform, and the last joints of the labia are enlarged. [TRIMERI.]

EUNA'PIUS, one of those writers known by the name of Byzantine historians, was born at Sardes, in Lydia, A.D. 347. He began his studies under the care of Chrysanthius the Sophist, by whose advice he is said to have composed the lives of some philosophers and physicians. In his sixteenth year he left Asia for Athens to attend the lectures of Proæresius, by whom he appears to have been subsequently treated with the utmost kindness. On his voyage he was seized with fever of a very violent kind, which yielded only to treatment of a peculiar nature. After attending Proæresius for five years he meditated a journey to Egypt, in imitation, as Hadrian Junius says, of Plato and Eudoxus; this intention however he was prevented from fulfilling. He practised medicine with considerable repute, and distinguished himself by a vehement antipathy to Christianity, produced, as is probable, by its growing corruptions.

Besides his biographical works, he wrote a continuation of Dexippus' history, from the reign of Claudius Gothicus, where he quitted it, to the year 404 A.D. It is violently in favour of the old creed, and, in the opinion of Hadrian Junius, shared those peculiarities of style which distinguish the Sophists. All that remain of his historical works are contained in the recent edition of the Byzantine Historians. There is a complete edition of his works by Boissonade, in 2 vols. 8vo., Amsterdam, 1822, with Wyttenbach's notes, and a life by Hadrian Junius. (See Photius, codd. 77, 219; Suidas, under the word 'Κωνσταντῖνος;' and Eunapius in his life of *Proæresius*.)

EUNO'MIA. [MILLEPORIDÆ.]

EUNO'MIUS, one of the chiefs of the Arian sect during the greater part of the fourth century, was a native of the town of Dacora, in Cappadocia, and at first was a lawyer. It is said that he also followed for some time the military profession. He then became a disciple of Aetius, under whom he very successfully studied the doctrinal theory of Christianity as understood by the Anti-Trinitarians. At Antioch he was ordained a deacon, and about A.D. 360 he was elected bishop of Cyzicum. The divinity of Christ was at this period the all-absorbing subject of ecclesiastical controversy. The Trinitarians contended for the Athanasian or Homoousian doctrine (from ὁμοουσίος, of the same essence), against the Semi-Arians, who held the Homoiousian doctrine (from ὁμοιούσιος, of the like essence), and against the doctrine of the Anomoians (from ἀνομοῖος, of a different essence). In defence of the last theory, or that of unmodified Arianism, Eunomius exerted a high degree of natural abilities, asserting the impossibility of two principles in a simple substance, one of which is generated from the other, and exhibits the relation of a son to his father. The divine essence, he said, is necessarily characterized by oneness and indivisibility; the persons of the Godhead, like the divine attributes of wisdom, justice, mercy, &c., are merely the names of ideal distinctions of the one Supreme Essence, as considered in its different relations with exterior objects, and it is contradiction and manifest absurdity to suppose this simple essence to consist of a plurality of principles or parts. In reply to these psychological subtleties, the advocates of the Trinitarian doctrine alleged the total incomprehensibility of the nature of God. (St. Basil, *Epist.* 166, St. Chrysostom, *De Incomprehensibilitate Dei Naturæ*.) Eunomius still acknowledged a father, son, and holy spirit, but the father as supreme, eternal, and distinct; the son as generated from the father; and the holy spirit as generated from the son.

In the ceremony of baptism he dipped only the head and shoulders, regarding the lower parts of the body as disreputable, and unworthy of immersion in the holy water; and it is said he taught that those who faithfully adhered to his own theory of Christian doctrine might commit any degree of sin without incurring the danger of perdition; but this is probably a misrepresentation by his opponents, who also accuse him of being an Antinomian, that is, one of those who reject the Mosaic law. (Theodoret, *Hæret.*, l. 4, c. 3; St. Augustin, *de Hæres.*; Epiphanius, *Hæres.*, 76; Baronius, *ad an.* 356.) Eunomius experienced a great severity of persecution without swerving in any degree from the Arian tenets with which he commenced his career. He was thrice banished from his episcopal see; first, by Constantius to Phrygia; then by Valens to Mauritania; and lastly, by Theodosius to the Island of Naxos: however, he died in peace, at a very advanced age, in the year 394. Most of his works are lost, including a copious commentary on the Epistle to the Romans, in 7 volumes, and numerous letters. Two of his principal treatises are printed in the *Bibliotheca Græca* of Fabricius, in Greek and Latin (tom. 8, pp. 235—305): 'A Confession of Faith,' presented in 383 to the Emperor Theodosius; and an 'Apologetic Discourse' in 28 chapters. (Cave's *Prim. Christianity*, part 2, c. 11; Pluquet's *Dict. de Hérésies*; Broughton's *Historical Dict.*; Dr. A. Clarke's *Succession of Sac. Lit.*, vol. i., p. 318; Basnage, in *Canisius*, i. 172.)

EUNUCH (εὐνοῦχος, *eunúchus*, literally, 'one who has the care of a bed'). The Greek word may be considered as descriptive of the functions of those who were made eunuchs, it being usual among the Persians to entrust the care of their wives and daughters to such persons. It does not appear that eunuchs were made by the Greeks, except as we shall presently mention. This peculiar species of barbarity was a Persian practice (Herod. vi. 32). It appears however that the Greeks sometimes carried on the trade of making eunuchs, whom they sold at Ephesus and Sardes to the Persians for high prices; the Persians considering that eunuchs generally were more trustworthy than other men. (Herod. viii. 105.) Tavernier tells us that in the kingdom of Bootan twenty thousand eunuchs were annually made in his time, to sell to other nations; and the seraglios of the East are principally served and guarded by them to the present day.

The Christian emperors of Rome forbade the practice of making eunuchs, particularly Constantine; and Justinian imposed a law of retaliation upon such as exercised this inhumanity. In Italy however the process of castration is still practised upon children intended to supply the operas and theatres of Europe as singers. The Council of Nice condemned those who from excess of zeal made eunuchs of themselves. Persons so mutilated were not admitted into holy orders. The reader who would know more on this subject may consult the 'Traité des Eunuques,' 12mo., 1707, by M. d'Ancillon.

Certain heretics of the third century bore the name of Eunuchs who had the folly or madness, after the example

of Origen, not only to castrate those of their own persuasion, but all whom they could lay hands on. They were also called Valesians, from Valesius, an Arab, who was their chief. (See Epiphanius and Baronius' *Annals*, under the years 249 and 260.)

EUO'MPHALUS. [Trochidæ.]

EUPATO'RIA. [Crimea.]

EUPATORIA'CEÆ, one of the tribes of composite plants admitted by De Candolle, who defines it thus:—'Style of the hermaphrodite flowers cylindrical; the arms long, somewhat clavate, covered externally with downy papillæ at the upper end. The stigmatic series but little prominent, and usually disappearing before they reach the middle of the arms of the style.' Under this character are arranged 38 genera, the most extensive of which is the genus Eupatorium, including no fewer than 294 species.

EUPEN, a circle in the Prussian administrative circle of Aachen, or Aix-la-Chapelle, and in the western part of the province of the Lower Rhine, is, though wooded and mountainous, full of fine pastures. It contains about 76 square miles. It produces timber, grain, vegetables, flax, &c., and large quantities of cheese are made. There are considerable manufactures. Iron, calamine, and potters' clay, are among its mineral products. The population in 1816 was 17,419; in 1831, 19,058; and is now about 19,800.

EUPEN, the chief town (the Néau of the former department of the Ourthe), is situated in a fertile valley on the banks of the Weeze, in 50° 39′ N. lat. and 6° 1′ E. long. It is well built, and with its gardens and meadows covers a considerable surface. It has four churches and chapels, an orphan asylum, and a good school, and contains nearly 1200 houses. The number of inhabitants was 8805 in 1818; 10,534 in 1831; and is at present about 11,300. There are large manufactures of kerseymere and fine woollens. The other productions are woollen yarn, soap, chicory, powder, deals, blotting paper, &c. It is a place of extensive trade, and has several manufacturing villages in the neighbourhood.

EUPHEUS. [Isopoda.]

EUPHO'RBIA, a genus of exogenous plants, giving its name to an extensive and important natural order. It has very small monandrous naked male flowers, crowded round an equally naked female one, in the inside of an involucre looking like a calyx, and formerly mistaken for that organ. The species have either a common leafy appearance, with the involucres proceeding from among large foliaceous bracts, or they are nearly leafless, with their stem excessively succulent, so as to resemble Cacti. Those with the former character are natives of most parts of the world, and are the only kinds found in Europe; the succulent species chiefly appear in the hottest and driest countries. Barren uncultivated places in the plains of Hindostan and the arid regions of Asia and the north of Africa are their favourite stations; in the Canaries, on volcanic soil, E. Canariensis and laphylla form great bushes with arms like candelabras. From Cacti, which some of these plants much resemble, they are readily known by their spines, when they have any, not growing in clusters, and by their emitting, when punctured, an abundant discharge of milky juice. This, in a concrete state, forms what is called the gum-resin, or rather resin, called Euphorbium, an acrid, corrosive, most dangerous drug, principally furnished by E. officinarum, antiquorum, and E. Canariensis. The same properties exist in the herbaceous leafy species, diffused in some, concentrated in others.

E. Lathyris, a common weed in cottage-gardens, where it is called 'caper,' yields from its seeds an oil of the most violent purgative nature. If it were less dangerous it might be substituted for Tiglium oil. Fée states that with as much of this oil as could be sold for a franc ninety adults might be purged.

A few species, having the involucre of some showy colour, are cultivated as objects of ornament; otherwise they are looked upon as mere weeds.

Euphorbia officinarum.

EUPHORBIA'CEÆ, a natural order of exogenous plants, with unisexual flowers and tricoccous fruit. Their real affinity is a matter of great uncertainty. Jussieu placed them among his Diclinous Dicotyledons, and probably he was right in so doing; nevertheless there are many strong marks of resemblance between them and Malvaceous, Celastraceous, and even Elæagnaceous plants. The number of Euphorbiaceæ is unknown, but certainly very considerable. They vary from trees of the largest size to minute herbs, of only a few weeks' duration, and from having both calyx and corolla highly developed to the total absence of those organs. In fact they are constant in scarcely anything except the short character we at first assigned them, and in their sensible properties. Acridity, a virulent corrosive property, which sometimes is so concentrated as to render them most dangerous poisons, and sometimes so diffused as to be of little importance, with all imaginable intermediate qualities, exists throughout the order. Hence some are fatal, others drastic or purgative, and some simply laxative. They also occasionally secrete a farinaceous substance which, being separated from the poison, is valuable for the food of man, as in the Cassava.

Among the more dangerous species of this order are the Manchineel, whose very shade is asserted to be dangerous, the Excæcaria, which derives its ominous name from its juice producing blindness; and the Euphorbias, that yield Euphorbium, Castor oil, and oil of Tiglium, well known valuable purgative medicines. Among other products may be named Cascarilla, the bark of a Croton, Turnsole, afforded by a Crozophora, Caoutchouc, the produce of Siphonia elastica, Hura crepitans, and others, and a kind of bird-lime yielded by Sapium aucuparium.

Andrachne telephioides.

1, a male flower; 2, a female flower; 3, an ovary nearly ripe; 4, a section of a ripe fruit.

EUPHO'RBIUM, improperly called a gum, or gum-resin, since it is entirely destitute of any gum in its composition, is the concrete juice of several species of euphorbia, either exuding naturally or from incisions made in the bark. Much of the article found in British commerce is obtained from the Euphorbia Canariensis, while that which occurs on the continent is obtained from Euphorbia officinarum (Linn.) and E. antiquorum (Linn.), and other African species, particularly from an undescribed species, called by the Arabs *dergmuse*. The branches of this plant are used in tanning, and to it, according to Mr. Ja

Medical and Surgical Journal, vi. p. 457), the morocco-leather owes its peculiarities. By the most recent chemical analyses, euphorbium seems to consist of resin, wax, and saline matter (mostly malates). The resin is the active principle, and differs in some respects from most other resins.

Euphorbium is a powerful acrid substance, causing irritation and inflammation of the parts with which it comes in contact, and by sympathy affecting the nervous system. The dust received into the nostrils or eyes occasions violent sneezing and lachrymation, or even more serious affections of the eyes, so that it is necessary for those who grind this drug to protect the face by masks. Delirium and stupor approaching to apoplexy have followed the inhalation of the dust. When swallowed, it causes, in small doses, vomiting and purging; in larger doses it produces inflammation of the stomach, and sometimes proves fatal. It is now little used, even as an external application to produce vesication or ulceration, except by veterinary surgeons. It is sometimes used as an errhine, largely diluted with starch, and enters into the composition of some cephalic and eye-snuffs; but it is apt to be violent in its effects. In case of poisoning by it, demulcent or oily fluids should be given, and venesection employed if much inflammation ensue.

EUPHRA'TES. [TIGRIS.] As new information may be expected on the subject of the Euphrates, we have determined to treat of this double river system under the head of TIGRIS.

EU'PION, a liquid obtained by Reschenbach from animal tar, especially that of bones or horns. The process for procuring it is operose and complicated. Its properties are—that it is very limpid, colourless, inodorous, and tasteless; it boils at about 340° Fahr., and distils unchanged; it remains fluid at 4°. It is insoluble in water, but dissolves in alcohol, oil of almonds and of olives, oil of turpentine, naphtha, &c.; it dissolves chlorine and bromine, which are cooled when it is heated, and it also takes up camphor, stearin, and napthalin, at common temperatures, but when heated, in larger quantity; with iodine it forms a blue solution: it dissolves phosphorus, sulphur, and selenium, when heated, but the greater portion is deposited on cooling; caoutchouc swells in it, and when heated dissolves. It is not altered either by exposure to air, or by acids or alkalis. It has not been analyzed.

EU'POLIS, a writer of the old comedy, was born at Athens about the year 446 B.C. (Clinton's *Fasti Hellenici*, ii. p. 63), and was therefore a contemporary of Aristophanes, who was in all probability born a year or two after. The time and manner of his death are involved in great obscurity. It was generally said that he was thrown overboard by the orders of Alcibiades, when that general was on his way to Sicily in 415 B.C., because Eupolis had ridiculed him in one of his comedies; but this story, which is sufficiently improbable in itself, was refuted by Eratosthenes, who brought forward some comedies which he had written subsequently to that period (Cicero *ad Attic.* vi. 1); besides, his tomb was, according to Pausanias (ii. 7, 3), on the banks of the Asopus, in the territory of the Sicyonians. Another account states that he fell in a sea-fight in the Hellespont, and that he was buried in Ægina. We have the names of twenty-four of his plays, but no adequate specimens of them. To judge from the titles, the object of Eupolis must have been, in almost every case, mere personal satire. The *Maricas*, which appeared in 421 B.C., was an attack upon Hyperbolus, the demagogue; the *Autolycus* (420 B.C.) was intended to ridicule a handsome pancratiast of that name, who is the hero of Xenophon's *Symposium*; and the *Lacedæmonians* was directed against the political opinions of Cimon, who was too much attached to that people, and had even called his son Lacedæmonius (Thucyd. i. 45). From the concurrent testimony of Lucian (*Adv. Indoctum*, § 217), of Platonius, and of the scholiast on Juvenal (ii. 92), it appears that the object of Eupolis in writing the *Baptæ* was to ridicule Alcibiades for taking part in the obscene rites of Cotytto, and that it was for this attack that Eupolis was thrown into the sea. (See Buttmann's *Essay on the Cotyttia and the Baptæ*, *Mythologus* ii. p. 159, &c.) Aristophanes and Eupolis were not upon good terms. Aristophanes speaks very harshly of his brother poet in *The Clouds* (551, &c.), and charges him with having pillaged from *The Knights* the materials for his *Maricas*; and Eupolis in his turn made jokes on the baldness of the great comedian (Schol. on *The Clouds*, 532). Eupolis published his first play when he was only seventeen years old (Suidas).

EURE, a river in France, which rises in the marshes and pools which occupy the eastern extremity of the department of Orne, near the town of Longny. Seven or eight miles from its source it enters the department of Eure et Loir, through which it flows in a south-east direction for about 25 miles without receiving any considerable accession. It then turns northward, and flows in that direction for about 85 miles, through the departments of Eure et Loir and Eure, and past the towns of Chartres, Maintenon, Anet, Ivry, Pacy, and Louviers, into the Seine, which it joins just above Pont de l'Arche; receiving in succession the rivers Voise on the right bank; the Blaise, which waters Dreux, and the Arve or Aure from Nonancourt, on the left; the Vesgre, from Houdan, on the right; and the Iton, which passes Damville and Evreux, on the left. Its whole course is nearly 120 miles. It is navigable from Pacy, about 27 miles above its junction with the Seine, or, according to another authority, from St. George's at the junction of the Aure, about 20 miles higher up; but the navigation is liable to frequent obstructions. It is chiefly used for the conveyance of salt, and of wood for building and fuel for the supply of Rouen. The Eure never freezes in winter.

EURE, a department in the north of France, comprehending a portion of the antient Normandie. It is bounded on the north by the department of Seine Inférieure, from which it is partly separated by the Seine; on the east by the departments of Oise and Seine et Oise, from both of which it is in part separated by the river Epte, a feeder of the Seine; on the south by the department of Eure et Loir, from which it is partly separated by the rivers Eure and Arve, or Aure, the latter a feeder of the Eure; on the south-west by the department of Orne, and on the west by that of Calvados. The form of the department is very irregular; its greatest length is from north-east on the Epte, near Mainville, to south-west, near Monnay, on the road from Rouen to Alençon, 68 miles, and its greatest breadth at right angles to the length, from Fiquefleur, on the Seine, to St. George's, at the junction of the Arve with the Eure, 65 miles. The area of the department is 298 square leagues, or 2297 square miles, rather more than the joint area of the English counties of Cumberland and Westmoreland, and rather less than the average of the French departments. Its population in 1832 was 424,248, or nearly 185 to a square mile, being considerably greater than both the relative and absolute population of the average of the French departments; and very far exceeding that of the two English counties just mentioned. The department lies between 48° 39′ and 49° 29′ N. lat., and 0°.15′ and 1° 48′ E. long. The capital is Evreux, in 49° 1′ N. lat., and 1° 8′ E. long.

The department has, properly speaking, no mountains, though that name is given to the crags which rise at the mouth of the Seine, near Quillebœuf, and do not much exceed 300 feet in height. Mount Rôti is the highest hill in the department; its barren summit rises above the fertile plain round Pont Audemer. The rivers all belong to the basin of the Seine, except the Calone, which falls into the Touques at Pont L'Evêque, in the department of Calvados. The Seine crosses the eastern side of the department in a north-western direction past Vernon, Petit Andely, and Pont de l'Arche, and flows for a short distance along the boundary. In its sinuous course below Rouen it again touches the northern boundary of the department three times, separating it from that of Seine Inférieure: its course within the department is about 40 miles, and along the border 27 miles; for all which it is navigable. The Eure crosses the department in a northward direction; 10 miles of its course are upon and 36 miles within the border, for 25 of which, or according to some, for the whole of which it is navigable. [EURE river.] The Arve, or Aure, has nearly 30 miles of its short course within or upon the border of the department; it flows east by north and joins the Eure on the border of the department at St. George's; it passes Chênebrun, Verneuil, and Nonancourt. The Iton rises in the department of Orne, and crosses this department in a winding channel in a north-eastern direction; its length is 60 to 65 miles; nearly the whole of its course is in this department; it passes Bourth, Breteuil, Damville, and Evreux. The Rille rises in the department of Orne, and crosses that of Eure in a northward direction till it falls into the Seine between Quillebœuf and Honfleur. It passes the towns of L'Aigle, in the department of Orne; and of Rugles, Neuve-

Lire. Beaumont, Briône, Pont-Authou, Annebaut, and Pont-Audemer in that of Eure; it receives between Beaumont and Briône the Charentonne, which rises in the department of Orne, and flows north-north-east past Chabrières and Bernay; the Charentonne receives the Gruil. The length of the Rille is nearly 80 miles, that of the Charentonne about 35 miles, and that of the Gruil 16 to 18 miles. The Epte and the Andelle, both feeders of the Seine, rise in the department of Seine Inférieure, and water the eastern side of the department of Eure; they have a length of about 50 and 28 miles respectively. Part of the course of the Epte is on the border of the department; most of that of the Andelle is within it.

The Iton and the Rille are, in one part of their course, absorbed by the strata over which they flow: the Iton loses itself near Damville, and flows underground for two miles.

The department is almost entirely occupied by the chalk which encircles the Paris basin and the strata more immediately connected with it, and covered with a vegetable soil, for the most part clayey, and very thin on the crests of the hills. Along the bank of the Seine there are some tracts covered with barren sand, and other parts are covered with the debris of quartz and silex, quite incapable of cultivation. Below Quillebœuf, a marsh on the bank of the Seine, once covered by the tide, has been reclaimed and brought into cultivation.

The climate is in general mild, moist, and changeable, bearing a considerable resemblance to that of England. The west and north-west winds bring rain and fog; these winds, with the north and the south-west, are the most common. The country is better wooded than France generally is, though it does not admit of comparison in this respect with England. In descending towards Pacy on the Eure, on the road from Paris to Caen, the magnificence of the prospect is very striking. The valley of the Eure, broad and perfectly level, abounds with fine trees, which enclose the rich meadows. But though the country is rich and fertile, the habitations of the peasantry are very wretched, being clumsily built of wood and earth, like the habitations of five or six centuries ago in the rest of France, and covered with thatch. Bricks and tiles might be made in the department, and houses built less liable to destruction by fire.

The agriculture of the department is considered to be in advance of that of the greater part of France. The produce in grain is considerable; in wheat it is twice as great as the average produce of the departments; and in rye and mixed corn or maslin three times as great: a considerable quantity of potatoes is grown, a small quantity of oats, and very little barley or buckwheat. The quantity of woodland is nearly a sixth of the whole area of the department; the quantity of land occupied in vineyards is small, and the amount of wine made is trifling. The plum, the pear, and the apple, are the fruits most cultivated: the principal timber trees are the oak, the beech, the elm, the hornbeam, the aspin, the service tree, the chestnut, the birch, and, in the valleys, the alder, the ash, the poplar, and the maronnier, or large chestnut tree. In the arrondissemens of Bernay and Pont Audemer, fine flax is grown from seed imported from Riga and Holland; and in various places, leguminous plants, hemp, weld or dyers' weed (for dyeing yellow), and teazles are cultivated. The farming is not very neat; and the hedgerows and ditches are not well kept. Plantations might be increased on the higher grounds. There are many natural meadows and pasture lands, and the cultivation of the artificial grasses is on the increase: the quantity of cattle is not much more than half the average of France, but the number of horses is above half as much again as the average. Horses are much employed in the labours of the field: the fine Norman breed, which the long wars had nearly destroyed, has been renewed with great care. The number of sheep is rather above the average of France: the wool is ordinary; but the flesh of those fed near the sea is delicate and in good repute. The number of swine and the quantity of poultry are considerable. Small game is tolerably plentiful; but the larger sorts, the roebuck, the stag, and the wild boar, which were formerly abundant, have been almost entirely destroyed since the Revolution. The rivers abound with fish, especially tench; and great quantities of the salmon and the shad ascend them from the sea and are taken.

The mineral productions are iron, freestone, sandstone, millstones, lime and gypsum, potters' clay, brick earth, and fullers' earth. There are several cold mineral springs; those of Vieux Conches are in the highest repute.

The manufactures of the department are various and important: Dupin (*Forces Productives et Commerciales de la France*, Paris, 1827), states the number of establishments of various kinds at 1511, of workmen at 30,157, and the value of the articles produced at 26,772,297 francs, or above 1,100,000*l*. The workmen are thus classified by Malte Brun: in the woollen manufacture 8500; in the iron and copper works 8000; in the tape manufacture 6000; in the cotton manufacture 4500; in the leather manufacture 1000; in the manufacture of glass, paper, and hosiery 2000. The population is not however collected into large towns, there being no town with 10,000 inhabitants, and only five which have 5000; and taking the whole department, the rural population is to that of the towns as nearly 5 to 1. There are many iron-works, and at Romilly on the Andelle are some of the most extensive and important copper-works in France; nails and pins are made at Rugles on the Rille, cards for carding wool and cotton, and machinery at Louviers, and machinery in the arrondissement of Louviers. The manufacture of linens is widely extended; the linens of Bernay are much esteemed. The woollen cloths of Louviers are among the best in France: other cloths of inferior quality, druggets and flannels, are made in different places in the department. Leather of excellent quality is made at Pont Audemer, and there are tan-yards at Evreux and other places. Tapes are made at the town and in the arrondissement of Bernay, bed-ticks at Evreux, and printed calicos and other cotton goods in various places: cotton and woollen and linen yarn are also spun. To the above articles may be added hosiery (at Pont Audemer), thread (at Bernay), glass, paper, musical instruments, ivory and boxwood combs. Dyeing and bleaching have been carried to great perfection.

The exportations to foreign countries consist of woollen cloths of all kinds, bed-ticks, linens, cotton goods, leather, copper goods, and pins: similar articles, together with iron goods, wood for the shipwright and the builder, and for fuel, corn and cattle, are sent into other parts of France. The imports consist chiefly of the raw material for the various manufactures.

The navigation of the Seine enables the department to communicate readily with Rouen and Paris: a cut in one part shortens the navigation a little: the Eure is navigable for a considerable part, if not the whole of its course in this department: the Iton is used for floating during part of its course; but the Rille is no longer used for that purpose It is navigable however up to Pont Audemer. The length of the navigable rivers and canals is half as much again as in the average of France. The department is also better provided with roads than the greater part of France: the road from Paris to Caen and Cherbourg crosses it from east to west through Pacy and Evreux; that from Paris to Rouen by Pontoise (department of Oise) and Ecouis: and that from Paris to Rouen by Vernon, Gaillon, and Pont de l'Arche, along the valley of the Seine, cross it from south-east to north-west. Roads from Rouen to Honfleur (department of Calvados) by Pont Audemer; to Alençon (department of Orne) through Bourgtheroude, Brîone, Bernay, and Chambrois; and to Evreux through Pont de l'Arche and Louviers; and from Evreux by Vernon to Gisors, also cross it in different directions. The road from Paris to Dieppe just passes through Gisors in the eastern extremity of the department; and that from Paris to Alençon, Laval, Rennes, St. Brieuc, and Brest, crosses the department just within the southern boundary following the valley of the Aure or Arve through Nonancourt, Tillières and Verneuil. A road from Rouen to Beauvais just touches the north-east extremity of the department. The other roads are bye-roads.

The department is divided into five arrondissemens: that of Les Andelys, in the east and north-east; that of Pont Audemer, in the north-west; that of Bernay, in the south-west; that of Evreux, in the south; and that of Louviers, central. The population is thus distributed among them: —Les Andelys, 64,337; Pont Audemer, 89,744; Bernay, 82,828; Evreux, 118,397; and Louviers 68,942. The number of cantons or districts under the jurisdiction of a justice of the peace is 36; that of the communes 844.

The principal towns are Evreux, the capital, on the Iton, population 7988 for the town, 9963 for the whole commune; Louviers, on the Eure, population 8627 for the town, 9885 for the whole commune; Pont Audemer, on the Rille, population 5305; Bernay, on the Charentonne, population

4480 for the town, 6605 for the whole commune; and Les Andelys, on the Seine, population 3432 for the town, 5168 for the whole commune. [ANDELYS, LES; BERNAY; EVREUX; LOUVIERS.] The population is from the returns of January 1, 1832.

In the arrondissement of Les Andelys there are Gisors, Etrépagny, Ecouis, Maineville, Lions-la-Foret, Charleval, and Ecose.

Gisors is on the Epte, which divides it into two parts, and on the road from Paris to Dieppe, 39 miles from Paris. The castle was built about A.D. 1100. In the wars of the English in France under Henry V., Gisors was taken by them; but it was afterwards delivered up to the French by the treachery of the governor. In the war of the 'League of the Public Good' against Louis XI. this town was taken by the revolted lords. There are considerable remains of the castle at the extremity of the town towards Rouen, on the river Epte. From its position and general outline, it much resembles the remains of Launceston Castle in Cornwall. The inclosure of the castle is now used as a market-hall; the fosse is planted with trees, and forms a promenade. Some portions of the antient town-wall yet remain. The church of Gisors is a large well-proportioned cross church, adorned with much elaborate sculpture; but its architecture is for the most part a jumble of Gothic and Roman. (Dawson Turner's *Tour in Normandy*.) It has some fine painted glass windows. The town itself is poor, but its situation is delightful, and the walks very pleasant. The population in 1832 was 3248 for the town, or 3533 for the whole commune. The inhabitants are engaged in bleaching calicoes and other fabrics, and manufacture cotton-yarn, printed calicoes, blonde and other lace, leather, glass and beer; they trade in corn and calves for the supply of Paris. There are a high school, a school of mutual instruction, a school for outline-drawing, and an hospital. Near Gisors is the antient castle of Vaux, now in ruins.

Etrépagny, otherwise Estrépagny or Trépagny, a small town a short distance west by north of Gisors, has a substantially-built church. Its population, as given in Dulaure's 'Histoire des Environs de Paris' (Paris, 1828), our latest authority, was 1250. The inhabitants manufacture lace, cotton-yarn, and knit goods, and trade in grain, pulse, cattle, and hemp. There are two fairs in the year.

Ecouis is on one of the roads from Paris to Rouen. It has a market-place covered in with wood, a château of modern construction, and an antient parish church, formerly collegiate. The last mentioned is a substantial but rather plain building in the form of a Greek cross; it contains the statues of several saints and the tomb of Jean de Marigny, archbishop of Rouen. The inhabitants are given by Dulaure at 634: they manufacture lace. There are two fairs in the year.

Maineville is near, but not on the Epte, a few miles north of Gisors.

Lions-la-Foret is on the little river Lieur, which flows into the Andelle. It was inhabited in the Roman times, as appears from some antient tombs, columns, painted walls, medals, and other antiquities discovered here at the beginning of the last century. There was in the middle ages a castle at Lions, where Henry I. of England died A.D. 1135. The population of the commune is given by Dulaure at 1900. The inhabitants manufacture printed calicoes and leather, and trade in corn.

Charleval is a small town at the junction of the Lieur with the Andelle. It takes its present name from a residence built here by Charles IX., of which there are some remains. Calicoes are printed and paper made. The neighbourhood is fertile.

Ecose or Ecos, a very small place, is near the Epte, and between Gisors and Vernon.

Pont St. Pierre, a village on the Andelle, has fulling-mills, a cloth factory, and a cotton-mill, in which above 300 workmen are employed; and at Romilly, just across the river, is an extensive foundry, employing above 300 workmen. Copper, brass, and zinc in sheets, and brass wire for pins are produced. At these works zinc is used instead of lapis calaminaris in the manufacture of brass. The coal is brought from Anzin and St. Etienne, in France [ANZIN; ETIENNE, ST.], and from Belgium.

In the arrondissement of Pont Audemer are Pont Audemer, Beuzeville, Conteville, Cormeilles, Lieurey, St. George du Vièvre, Pont Authou, Annebaut or Appeville, Bourgthéroude, Bourgachard, Routot, Bourneville, and Quillebœuf.

Pont Audemer is on the left bank of the Rille, and on the road from Rouen to Honfleur, 29 miles from Rouen. In the Norman period it was a military station, and was the first scene of conflict between Henry I. of England and his rebellious Norman barons: the victory was gained by the king, to whom the fortress immediately surrendered. In the fourteenth century it was defended successfully by its lord, the count of Evreux, against the generals of the king of France: this was the first siege in which cannon were employed in that kingdom. It was afterwards taken by Duguesclin, its castle razed, and the walls and towers of the town destroyed. It is a small neat place, at the foot of an eminence, with handsome streets and good brick houses. It is defended by walls and a ditch, which may be filled with water at will by means of sluices. It has four gates, and several places or squares. There are several churches, but some of them are now desecrated and converted to other uses. The population in 1832 was 5305: the inhabitants manufacture cotton yarn, printed calicoes, muslins, bed-ticks, tapes, hosiery, and especially leather. The leather is thought to be the best in France. There are an agricultural society and a theatre. The river is navigable up to this town: several of the arms into which its channel is divided have mills on their banks.

Beuzeville has a population of above 2000: the inhabitants are engaged in tanning leather and sawing marble they have some linseed-oil mills.

Conteville is near the mouth of the Rille. The 'Dictionnaire Universel de la France,' our latest authority (Paris, 1804), gives its population at 900.

Cormeilles is on the road between Pont Audemer and Lisieux. It had formerly a Benedictine abbey, founded by William Fitzosborne, a relation of William the Conqueror. The church and other monastic buildings, which had gone much to decay, were repaired in the early part of the last century. The population, according to the 'Dictionnaire Universel de la France,' was 1210. There are an oil-mill, a paper-mill, and tan-yards; linen and calico are manufactured, and some trade carried on in corn.

Lieurey and St. George du Vièvre (population 900), where linen and paper are made, are between the Calone and the Rille.

Pont Authou (population 628), where woollen yarn is spun and cloth made, and cattle sold, and Annebaut (population 1150), where are the ruins of an antient castle, are on the Rille. The population of these places is given from Dulaure: it is not the last return.

Bourgthéroude, near the boundary of the department, not far from Elbœuf, derives its name (in Latin *Burgus Thuroldi*) from Thurold, one of the preceptors, and afterwards grand constable, of William the Conqueror. Its church was formerly collegiate. The inhabitants are given by Dulaure at 738.

Bourgachard is not far from Bourgthéroude. There was an abbey at Bourgachard, but it is now levelled with the ground; there is an hospital or almshouse. The population is given by Dulaure at 1114. The market is considerable.

Routot (population 1100, Dulaure), which trades in cattle and wool, and Bourneville (population 781, Dulaure), are on a bye-road from Bourgachard to Quillebœuf, which is on the left bank of the Seine, on a point formed by a bend of the river. Its port is much frequented by the boats which navigate the Seine, and those vessels which are too large to ascend the river as far as Rouen discharge their cargoes here. It was formerly a place of considerable strength. The inhabitants (1500, Dulaure) carry on a considerable fishery, or pilot vessels up the Seine; the women manufacture lace.

Montfort, on the Rille, between Pont Authou and Annebaut, is given as a village in some of our authorities, as a town in others. It has the ruins of an antient castle, besieged for thirty days in A.D. 1122 by Henry I. of England, and gives title to an English peer. The inhabitants (520, Dulaure) manufacture leather, paper, and woollen cloth, and trade in cattle and linen.

In the arrondissement of Bernay are Le Bec, Briône or Brionne, Beaumont le Roger, La Barre, Beaumenil, Chambrois, Thiberville, and Harcourt.

Le Bec, sometimes distinguished as Le Bec Hellouin, is near the bank of the Rille. Here, before the Revolution, was a Benedictine abbey of the congregation of St. Maur, one of

the wealthiest in Normandie, founded by Hellouin, a noble of the country, about A.D. 1034. The abbot's patronage was very extensive. Soon after its foundation this abbey became the seat of a famous school, founded here by Lanfranc, one of the monks of the convent, afterwards archbishop of Canterbury. Anselm, Theobald, and Hubert, also inmates of this abbey, were subsequently raised to the same archiepiscopal see, and Roger, the seventh abbot, had the offer of that dignity, but refused it. The sees of Rochester, Beauvais, and Evreux, were filled by monks from this abbey, which furnished abbots to the convents of Chester, Ely, and St. Edmund's Bury. The Empress Maud, daughter of Henry I. of England, is said to have been buried here. The abbey was fortified when Henry V. invaded France, and stood a siege of a month before it was surrendered to the English. The greater part of the conventual buildings still exist. The tower, 150 feet high, a few ruined arches, and one of the side chapels, are the only parts of the church which remain. A part of the grounds are appropriated to a stud for keeping up the breed of Norman horses. The town of Le Bec is unimportant: its population is about 700.

Brionne was, under the dukes of Normandie, a place of some importance; it had three churches, an abbey, and a lazar house, beside an antient castle, of which some slight remains exist, and it was the capital of an earldom, created in favour of a son or brother of one of the dukes of Normandie. The town is pleasantly and advantageously situated on the banks of the Rille. It has only one church now. The inhabitants may be estimated at about 2000. A mill for spinning cotton yarn employs 120 hands, and a cloth factory 500 · rape and linseed oils are expressed.

Beaumont le Roger, on the Rille, had also a strong castle and a Benedictine priory. The inhabitants are given in the *Dictionnaire Universel de la France* at 1325: a cloth factory employs 400 hands, a glass-house 100; bottles, chiefly intended for Bretagne, are blown in great quantity at the latter establishment.

La Barre and Beaumenil are between the Rille and the Charentonne: their population was, according to the *Dictionnaire Universel*, 948 and 484 respectively.

Chambrois is on the Charentonne, above Bernay; and Thiberville, near the source of the Calone; the inhabitants of the latter (population 1200 according to the *Dictionnaire Universel*) are occupied in weaving tape. This branch of industry employs at the neighbouring village of Drucourt and the surrounding communes, 4600 workmen.

Harcourt, not far from Brionne, gives title to an English nobleman: there are some remains of an antient castle, built by Robert de Harcourt, one of the companions of William the Conqueror in his invasion of England: the *Dictionnaire Universel* gives the population at 1297.

In the arrondissement of Evreux are Neuvelire, Rugles, Conches, Damville, Breteuil, Bourth, Chênebrun, Verneuil, Tillières, Nonancourt, Ivry, Pacy, St. André, Villiers-en-Desœuvre, and Vernon.

Neuvelire (otherwise Neuvelyre) and Rugles are on the Rille; the latter is higher up the stream. Neuvelire has 600 inhabitants, who trade in corn and cattle; at Viellelyre, near it, there are iron works. Rugles is of more importance; it is the centre of a pin manufacture which employs 2500 workmen, and of a nail manufacture which employs 3600 more. Zinc and copper are rolled out into sheets: the manufacture of iron cables, once carried on in this town, has been transferred to Nevers, in the centre of France.

Conches (pop. in 1826 1725) is on the river Conches, a small stream which joins the Iton between Damville and Evreux. Nails, agricultural implements, and other iron goods, are manufactured here: there are tan-yards, paper, oil and tan mills, and trade is carried on in iron, earthenware, hay, and cattle. The iron work of the bridges des Arts and d'Austerlitz at Paris were cast here.

Damville, Breteuil, and Bourth, are all on the Iton. Their population is given by Dulaure at 762, 2000, and 1670, respectively: there are iron works at all of them. Pins are made at Bourth; and at Breteuil, cannon of every calibre, projectiles of all kinds, screw taps, cauldrons, iron pots and other iron wares, tiles, and bricks. There are at Breteuil mineral waters and the remains of a castle, built by William the Conqueror.

Chênebrun, or Chennebrun, is on the Aure: it is very small; its population is about 360.

Verneuil is on the Aure: it is well laid out with broad straight streets, but wretched and ill-built houses of earth and wood, with a few only of brick: it had in 1832 a population of 3722 for the town, or 4178 for the whole commune. The manufactures of this town and its vicinity consist of leather for bookbinders (but this branch of industry has much declined) and of cotton hose, but this is also languishing. There is a Gothic church in the town, the steeple of which is said to have been built by the English, and an old tower, the remains of a castle which formerly defended the town. This tower is popularly but erroneously ascribed to the Romans. The site of the ramparts has been laid out in promenades. The English obtained a victory over the French at Verneuil in the reign of Henry VI., A.D. 1424. There is a small library.

Tillières and Nonancourt are also on the Aure: they have a population (according to Dulaure) of 950 and 1359 respectively. At Tillières pins and nails are made; and at Nonancourt woolcombers' cards, machinery, woollen and cotton yarn, woollen cloth, calicoes, hosiery, linen, and paper; trade is also carried on in corn and cattle.

Ivry, on the Eure, at the junction of the Vesgre, is celebrated for the battle fought in the adjacent plain, in which Henri IV. routed the army of the League under the duke of Mayenne, A.D. 1590. A pyramid, overthrown at the Revolution, but restored by Napoleon, commemorates the battle. It is a town of 800 inhabitants (Dulaure), who manufacture musical wind instruments, ivory and boxwood combs, cotton yarn, and leather, and carry on trade in corn, cattle, and horses.

Pacy is on the Eure, at the point where, according to some of our authorities, the navigation begins, in a fertile valley. It was antiently a place of some importance, and was defended by a castle and strong ramparts. Before the Revolution it had three churches (one parish church and two others) and a Benedictine abbey. The inhabitants, 1364 in number (Dulaure), trade in cattle and horses (for which they have a large fair), corn, woollen and linen cloth, and iron.

St. André, between the Eure and Iton, had a population of 977 (Dulaure): some trade in cattle is carried on.

Villiers en Desœuvre, a short distance from the bank of the Eure, had a population of no more than 450 (Dulaure); it has some trade in cattle and horses.

Vernon is on the left bank of the Seine, and on the road from Paris to Rouen. Here was in antient times a castle, which William the Conqueror bestowed on his relation, Guy, son of the count of Bourgogne, and which was strengthened by Henry I., the Conqueror's son. The town is situated in a singularly beautiful valley, and is connected by a bridge of twenty-two arches with the suburb of Vernonnet, on the other bank of the Seine. Of the antient defences of the town there remains only a tower, in which the archives of the place are preserved. The church, part of which exhibits some very early Norman architecture, was formerly collegiate; it contained before the Revolution several monuments. The population in 1832 was 2703 for the town, or 4888 for the commune, including the suburb, Vernonnet. Cotton velvet, plain and printed calicoes, leather, and cotton yarn, are manufactured: there is an establishment for making the equipage of the artillery, and another for sawing stone; also lime, gypsum, and tile kilns: trade is carried on in corn, flour, wine, wool, feathers, and cattle.

The arrondissement of Louviers contains Pont de l'Arche, Gaillon, and Neufbourg.

Pont de l'Arche is on the left bank of the Seine, just below the junction of the Eure, and at the point where the tide ceases to be perceptible. It owes its origin to Charles le Chauve, who erected here a palace, in which he convened councils, held assemblies of his nobles, and drew up edicts; and built a fine bridge, defended at one extremity by a citadel, from which the name of the place (in Latin Pons Arcis) is derived, and which was demolished about the beginning of the Revolution. Pont de l'Arche was burned by the English under Edward III. The walls of the town yet remain flanked by circular towers. The bridge is the lowest stone bridge down the Seine, and the only one of any kind between Vernon and Rouen: it is a picturesque object, with mills in some part of its length, and a lock under one of the arches to facilitate the navigation of the river and render it secure. On the bank of the river near the town are the remains of a Cistertian abbey, founded, A.D. 1190, by Richard Cœur de Lion, in pursuance, it is said, of a vow which he had made when nearly lost in the rapid current of the Seine. The church of Pont

de l'Arche, though much dilapidated, is a fine building in the decorated style of Gothic architecture: it has some rich carving, and handsome painted windows. The population is given by Dulaure at 1480: the inhabitants manufacture woollen cloth, and trade in cattle, horses, and fruit-trees.

Gaillon is near the left bank of the Seine, between Pont de l'Arche and Vernon. This town was bestowed by St. Louis on the archbishop of Rouen, whose successors had a palace here up to the period of the Revolution, and enjoyed the sole right of trying civil and criminal causes. This palace, destroyed in the wars of the English, A.D. 1423, was rebuilt a century afterwards by the archbishop, George d'Amboise, and embellished by his successors: after being nearly destroyed during the Revolution it has been repaired and fitted up as a prison, and contains now 1200 to 1400 prisoners who are employed in making carpets and cotton goods, and plaiting straw. There was a Carthusian convent here before the Revolution, founded by one of the archbishops of Rouen. A fountain in the town has the property of incrusting with its deposits any object thrown into it. Gaillon is a poor place; its population is given by Dulaure at 1030. The inhabitants carry on trade in cattle and woven goods. Near Gaillon are vineyards, the most northern in Normandie: the grape grown is the small black cluster; the wine produced is of very inferior quality.

Neufbourg or Neubourg, between Louviers and Beaumont le Roger, has the remains of an antient castle where the eldest son of Henry II. of England espoused Marguerite daughter of Louis VII. (*Le Jeune*) of France. The inhabitants, whom Dulaure gives at 1675, manufacture linens and calicoes, dimities, fustian, &c., and carry on trade in corn, wood, cattle, and iron goods.

The department constitutes the diocese of Evreux, the bishop of which is a suffragan of the archbishop of Rouen: it is in the jurisdiction of the Cour Royale of Rouen, and in the circuit of the 'Academie,' or council of education of that city. It is in the 14th military division, of which Rouen is the head-quarters. It sends seven members to the Chamber of Deputies. Education is more attended to than in the average of the French departments: it furnishes one male scholar for every twenty-four inhabitants. This department consists of parts of the former districts of Le Vexin Normand, Le Roumois, La Campagne, Ouche, Lieuvin, all in Haute or Upper Normandie.

EURE ET LOIR, a department in France, occupying a portion of the country between the Seine and the Loire. It is bounded on the north by the department of Eure, on the east by that of Seine et Oise, on the south-east by that of Loiret: on the south by that of Loir et Cher; on the south-west, for a short distance, by that of Sarthe; and on the west by that of Orne. Its only natural boundary is on the north, where it is separated from the department of Eure by the rivers Arve (or Aure) and Eure, and for a very little way on the north-east. Its greatest length is from north by east, near Villiers in Descœuvre (department of Eure) to south by west near Cloyes on the Loir, 68 miles, and its greatest breadth, at right angles to the length, is from near Nogent le Rotrou to the neighbourhood of Thoury, 55 miles. It is between 47° 57′ and 48° 56′ N. lat., and between 0° 45′ and 1° 59′ E. long. The area of the department is 304 square geographical leagues (French measure) of 25 to a degree, equal to 2325 English square miles, which is not much below the average area of the French departments, and a very little more than that of the two English counties, Kent and Surrey, taken together. The population in 1832 was 278,820, or 120 to a square mile, about three-fourths of the average population, absolute and relative, of the French departments, and not so much as three-tenths of that of the two English counties. Chartres is the capital.

There are no very lofty hills in the department, but the general level of the country is high; the western part is varied with hills and valleys, the hills being a prolongation of those which overspread Bretagne and Upper Normandie, and which enter this department from the north-west; in the south-eastern side of the department these hills expand into an elevated plain, or table-land, level and without water, though just between two of the largest rivers of France, the Loire and the Seine. This table-land extends on the south-west into the adjacent department of Loiret. The hills divide the department into the basins of the two rivers from which it takes its name; that of the Eure occupying the northern part, and that of the Loir the southern.

The Eure enters the department not far from its source, and flows through it, or along the border, about 70 miles, first in a south-eastern direction past Belhomert, Pontgouin, and Courville, and then in a northward direction past Chartres, Maintenon, and Nogent le Roi. [EURE River.] Its chief tributaries are the Voise (17 miles long), which rises near Auneau and flows into it from the south-east on its right bank below Maintenon, passing the towns of Guédelongroy and Gallardon; the Blaise (about 26 miles long), which rises near Senonches and flows into it from the south-west near Dreux, passing Maillebois and Dreux, and flowing in a channel continually dividing and re-uniting; the Aure, which has been noticed elsewhere [EURE Department]; and the Vesgre (22 miles long), which rises in the adjoining department of Seine and Oise, between Montfort L'Amaury and Rambouillet, and flows in a north-west direction through this department into the Eure at Ivry. The Mauvette, or Meuvette (14 miles long), rises near La Ferté Vidame and flows north-east past Brezolles into the Aure at Nonancourt; and the Oplon, which is a feeder of the Vesgre, and belongs to the department of Seine and Oise, flows for a very short distance along the eastern boundary of the department.

The Loir rises on the south-west slope of the hills which divide the two basins, a short distance south of Courville, and flows 10 miles south, past Illaire, or Illiers, just below which it receives the Thironne, and afterwards the Fouchard; it then flows south-east, and then south (12 miles) past Bonneval, near which it receives the Ozanne; all these join it on the right, or west bank. It then turns to the south-west, and flows 20 miles before it quits the department, receiving by the way the Connie, on the left bank, and the Yere on the right. The whole course of the Loir is about 160 or 170 miles, for nearly 30 of which (viz., from Château du Loir) it is navigable; it falls into the Sarthe just before the junction of that river with the Mayenne: the whole belongs to the system of the Loire (La Loire, feminine), from which the Loir (Le Loir, masculine) is to be carefully distinguished, both as to itself and its orthography.

The Thironne (12 miles long), the Fouchard (15 miles long), and the Ozanne (25 miles long), all rise a short distance east or south-east of Nogent le Rotrou, and all flow east by south into the Loir. The Connie, or Conie (above 20 miles long), rises in the adjoining department of Loiret, near Patay, and flows west-north-west into the Loir, receiving the Connie Palue (12 miles long), which has all its course in the department, on its right bank. The Yere rises in the south-west corner of the department, and flows east-south-east 22 miles into the Loir.

The Hume, a feeder of the Sarthe, just passes Nogent le Rotrou on the western side of the department; and the Braye, which separates the departments of Sarthe and Loir at Cher, and joins the Loir much lower down, has its rise just within this department.

The canal from Pont-gouin to the aqueduct of Maintenon connects the upper part of the Eure at Pont-gouin with the lower part of the same river at Maintenon. The canal is about 27 miles long. The aqueduct was originally designed to convey the waters of the Eure to Versailles, but the design was given up; and the aqueduct, a vast pile, is fast going to decay.

The étang, or pool, of Bois Ballu is supplied with water chiefly from a deep pit, from which, at certain periods, fishes of considerable size are ejected, which disappear a few days after.

The greater portion of this department is occupied by the chalk which encircles the Paris basin, or the strata most immediately connected with it: on the south-east a considerable tract is occupied by the various formations which overlie the chalk. The soil and produce are thus somewhat vaguely described in the *Dictionnaire Géographique Universelle*, Paris, 1827:—'The lands in this department are clayey, mixed with a small quantity of sand; there are also some calcareous soils mingled with clay and sand; others are clayey mingled with large flints (fragmens grossiers de silex); others consist of a deep arid sand. The slopes of the south-west have little vegetable soil; they sometimes are composed of marl and flint (de marne et de silex), sometimes of a reddish sand and flint. The marl, which is found almost every where, is used for the improvement of the land. In the arrondissement of Nogent le Rotrou (the

western side of the department) there are many tracts of waste land scarcely capable of producing anything; the ashes of the heath and furze are used for manure. Two-thirds of the department consist of the former territory of Beauce, or Beausse [BEAUSSE], which is a great agricultural district: corn, especially wheat, which yields a great proportion of flour, constitutes its principal riches of this part of the department; the harvests are very abundant, and their produce is chiefly destined for the supply of Paris. In the rest of the department rye, barley, and oats are produced; pulse (légumes) is grown every where; the turnips of Saussaie, the melons of Nogent le Roi, and the onions of Chaudons are in high repute; few potatoes are grown; but in some parts rape, flax, hemp, dyers' weed (reseda luteola), and teazles are raised for the use of the manufacturers; hops grow spontaneously; the vine is cultivated in many places; the wine is of middling quality, and liable to turn sour in hot weather. There are few fruit-trees in the former district of Beauce, but many in the arrondissement of Nogent le Rotrou, especially apple-trees, which furnish cider for home consumption.'

According to M. Dupin (*Forces Productives, &c. de la France*) the value of land and the aggregate rental of the department are above the average of France; the quantity of wheat grown is to the average produce of the other departments as more than five to two; that of oats nearly as four to two; and that of potatoes, contrary to what is stated in the above extract, is more than eight to two. 'The forests (we quote again from the *Dictionnaire Géographique Universelle*) occupy an extent of 45,000 hectares (above 111,000 acres), and consist, in a great measure, of oaks and birches: all the woodland is on the western side of the department, except some round Dreux, in the northern part. The pasture and meadow-land is not in proportion to the quantity of arable, but it is of good quality. A considerable number of horned cattle of a small race are reared; but not a sufficient number of horses for the wants of the agricultural districts: those which are bred in the arrondissement of Nogent le Rotrou are in request for the light cavalry. There are many sheep, some of which yield a fine wool; pigs, fowls (which are sent in great quantity to Paris), and bees. Game is abundant; the rabbits are in repute, as well as the red partridges, plovers, lapwings, and especially a species of the plover called guignard, from which the Chartres pies derive their reputation; pigeons are again increasing. The rivers abound with fish; the golden carp of the Loir, the crayfish of its affluent, the Connie, the trout of the Blaise, the Eure, and the Huine, are accounted excellent.' The number of horses, however insufficient, is given by M. Dupin at 35,967, nearly 8000 above the average of the departments: the number of horned cattle is given by him at 56,464, more than 23,000 below the average: the quantity of wool grown is to the average produce of the departments in the proportion nearly of five to two; and this is more available for exportation, as the woollen manufacture of the department is not great. The department is essentially agricultural; corn is sent not only to Paris, but into the neighbouring departments. There are about 600 flour-mills; a great number of them are on the Eure, the Blaise, the Loire, and other streams. The cottages of the peasantry are, in some parts at least, of a most miserable character; they call to mind the tents of the antient Carnutes who occupied the country.

The only metal dug is some iron: but the mines supply only a part of the ore for the different iron-works, and are becoming exhausted: good freestone is quarried, and sandstone for pavement; there is much marl; peat for fuel is obtained in several places, also potters' clay, and clay for the finer kinds of earthenware produced in the manufactory at Sèvres.

The manufactures are of small importance; they are chiefly in the arrondissement of Dreux, and in that of Chartres. The manufacture of linen is generally diffused, but it is only in one place that it is carried on on a considerable scale; some cotton yarn is spun and some cotton goods are woven; woollen cloths, serges, and other light woollen stuffs, blankets, flannel, knit and woven hosiery, foot carpets, and common hats are made; there are a considerable number of tan-yards; a small quantity of earthenware is made, and a little beet-root sugar.

The department is very ill provided with the means of water carriage; a small part of the course of the Eure, along the boundary of the department, is, according to some of our authorities, navigable. With roads it is better provided. The great road from Paris through Tours to the south-west of France crosses the department, passing through Epernon, Maintenon, Chartres, Bonneval, Châteaudun, and Cloyes; the great western road from Paris to Rennes and Brest just crosses the northern part through Dreux: these are the only roads of the first class. Of the second class are the Orléans road, passing just within the south-eastern boundary of the department, through Thoury; and the road which, branching off from the great south-western road at Chartres, runs through Courville Champrond and Nogent le Rotrou in the direction of Le Mans, Angers, and Nantes. Of roads of the third class are a road from Paris to Chartres through Guédelongroy, roads from Chartres to Dreux and to Orléans, and from Châteaudun to Nogent le Rotrou (and from thence to Alençon, in the department of Orne), and to Orléans. The other roads are bye-roads.

The department is divided into four arrondissemens that of Dreux, in the north, population in 1832 70,532; that of Chartres, in the east and centre, population 103,783; that of Châteaudun, in the south, population 59,758; and that of Nogent le Rotrou, in the west, population 44,747. These arrondissemens are subdivided into 24 cantons, or districts of justices of the peace, and 460 or 463 communes. The chief towns are Chartres, the capital, on the Eure, population 13,576 for the town, or 14,439 for the whole commune [CHARTRES]; Châteaudun, on the Loire, population 6461 [CHATEAUDUN]; Dreux, on the Blaise, population 5166 for the town, 6249 for the whole commune [DREUX]; and Nogent le Rotrou, on the Huine, population 5812 for the town, or 6825 for the whole commune Of this last and the smaller towns an account is subjoined.

In the arrondissement of Dreux we have Bu, Anet, Nogent le Roi, Le Tremblay, Châteauneuf, Digny, Senonches, Maillebois, Brezolles, and La Ferté Vidame.

Bu (population 1549, Dulaure, *Environs de Paris*, Paris, 1828) was once a place of considerable strength; it has still the ruins of an antient castle, of which one tower is in pretty good preservation. It was the capital of a county. Its markets are well attended.

Anet (population 1500, Dulaure) is in the northern extremity of the department, in a pleasant valley between the Vesgres and the Eure; it has the remains of a magnificent residence, built by Henri II. for Diane de Poitiers, duchess of Valentinois, his mistress. There are tan and corn-mills, and in the neighbourhood paper-mills and iron-works; the inhabitants carry on trade in corn, wood, and hay.

Nogent le Roi (population 1242, Dulaure) is in a pleasant valley on the left bank of the Eure. The inhabitants carry on a trade in cattle. Nogent belonged to Philippe VI. de Valois, who died here A.D. 1350. It is probable that it derived from this prince its distinctive epithet of Le Roi; it was, with its territory, erected into a county in favour of Bautru, one of the courtiers of the cardinal de Richelieu. The castle of Nogent, built on a hill which commands the town on the western side, was an object of frequent contest in the times of feudal warfare and in the wars of the English in France under their kings Henry V. and VI. It was garrisoned by Henri IV. in his war with the League, taken by the inhabitants of the neighbouring towns, who had embraced the party of the League, and to whom the garrison was an annoyance, and retaken by the royal forces.

Le Tremblay is very small; its population is under 500 (Dulaure); it lies a little out of the road from Dreux to Chartres.

Châteauneuf (population 1250, Dulaure) is in a fertile plain between Dreux and Nogent le Rotrou. Here was an antient castle, Castrum Theodemerense, a name which was corrupted into Thimer, and gave to the surrounding territory the name of Thimerais; whence Châteauneuf is sometimes distinguished as Châteauneuf en Thimerais. In A.D. 1589 it was taken by the troops of the duke of Mayenne and retaken by those of Henri IV. The inhabitants now carry on a trade in cattle.

Digny is not far from Châteauneuf, with a population, according to Dulaure, of 1197. Some of our authorities make this to be only a village.

Senonches and Maillebois are on the Blaise; the former near its source, the latter lower down. At Senonches (population 1911, Dulaure) steam-engines and hydraulic machines are made, and there are iron-works. Trade is carried on in cattle and horses. At Maillebois (750 inha-

bitants, Dulaure) woollen cloth and light woollen stuffs are made. Peat is dug in the neighbourhood.

Brezolles is on the Meuvette. Dulaure gives the population at 844. Trade in cattle is carried on.

At La Ferté Vidame (population 808, Dulaure), in the north-western part of the department, trade is carried on in horses and cattle. Some of our authorities make this to be only a village.

In the arrondissement of Chartres are Epernon, Maintenon, Gallardon, Guédelongroy, Auneau, Ouarville, Voves, Janville, Thoury, Illaire or Illiers, Courville, and Pont-gouin.

Epernon is on the high road from Paris to Chartres, in a delightful situation on the slope and at the foot of a hill, near the little river Guesle, a feeder of the Eure. It is tolerably well built: it was formerly walled in on three sides; on the fourth side (the north) it was defended by a castle on the summit of the hill, of which some picturesque ruins still remain. The country round consists of fertile meadows, watered by several brooks. The inhabitants (1462, Dulaure) manufacture leather: there are kilns for gypsum; and trade is carried on in flour, excellent pulse, horses, and cattle.

Maintenon is on the right bank of the Eure, at the junction of the Voise. It was erected into a marquisate in 1685, in favour of the widow Scarron, wife of Louis XIV., better known in history by the name, which she took from this town, of Madame (or rather La Marquise) de Maintenon. The Château de Maintenon was built by Jean Cottereau, intendant of the finances, and sold by his descendants to Madame de Maintenon: some portions of Cottereau's edifice may be observed in the present structure. The chapel of the château is scrupulously preserved: the tradition that Louis XIV. and Madame de Maintenon were married there appears from the testimony of history to be unfounded. The apartment of Madame de Maintenon retains a portrait of her. The grounds are large and well kept up; they are intersected in every direction by numerous canals, over which are no less than 50 bridges. The town itself, though well laid out and well built, presents nothing remarkable: the inhabitants (1542, Dulaure) carry on trade in cattle. Collin d'Harleville, a dramatic author of note, was born here. The aqueduct of Maintenon has been already noticed. Near the town is a plain covered with Druidical remains, called the stones of Gargantua.

Gallardon is on the right bank of the Voise, at the junction of the little brook the Ocre; it had antiently a castle: the town was several times taken and retaken in the wars of the English in France in the fifteenth century. Dunois, who took it from the English A.D. 1443, destroyed the castle except one tower, which still remains. Gallardon was taken by the Huguenots under the Prince of Condé, in the religious wars of the sixteenth century. The inhabitants (1398, Dulaure) carry on trade in corn, pulse, horses, oxen, calves, and sheep.

Guédelongroy is on the Voise. Vaysse de Villiers, who terms it a village, assigns to it a population of 500.

Auneau is on a small stream running into the Voise. It has the remains of a castle, probably built at the latter end of the fourteenth century. In this castle, in the religious wars of the sixteenth century, a body of German cavalry, in the service of the Protestants, were surprised by the royal troops, and in great part killed. What remains of the castle is used as a dwelling-house; at the entrance is a tower of very substantial construction, which commands the surrounding country. The inhabitants of Auneau (1400, Dulaure) manufacture hosiery.

At Ouarville (population 723, Dulaure) hosiery, and at Voves (population 1136, Dulaure) hosiery and light woollen stuffs are manufactured; and at Ouarville trade is carried on in horses and cattle. At Janville (population 986) hosiery and light woollen stuffs are manufactured; and at Thoury or Toury, near Janville (population 1232, Dulaure), hosiery and beet-root sugar; a trade in horses, asses, mules, and cattle is also carried on.

Illaire is on the left bank of the Loir, near its source: its population, in 1832, was 2059 for the town, or 2937 for the whole commune: the inhabitants carry on trade in cattle, sheep, and wool; and manufacture woollen cloths, white serge, and other light woollen stuffs, and hosiery: there are some tan-yards.

Courville and Pont-gouin are both on the left bank of the Eure, the first on the road from Chartres to Le Mans and Angers, the second on a road branching from this at Courville to Belême, Mamers, and Alençon. At Courville (population 1341, Dulaure) some trade in horses and cattle is carried on. The château which the descendants of Sully possessed in this town has been entirely destroyed; but that at Villebon, distant two or three miles from Courville, where that great statesman died, is yet in good preservation, and is one of the finest remains of the sixteenth century. At Pont-gouin (population 1400, Dulaure) white serge is made.

In the arrondissement of Châteaudun are Sancheville, La Ferté Villeneuve, Bonneval, Cloyes, and Brou.

To Sancheville, which is, according to some of our authorities, a village, Dulaure assigns a population of no more than 886. La Ferté Villeneuve is still smaller.

Bonneval is on the road from Chartres to Tours, in a pleasant fertile valley on the left bank of the Loir, which here flows in several channels. It was formerly a place of some strength. The parish church has a lofty spire. The inhabitants (1750, Dulaure) manufacture carpets, counterpanes, flannels, woollen stuffs, calicoes, and printed cottons; and spin cotton and woollen yarn. Trade is carried on in corn, flour, wool, and cattle; and there are some considerable tan-yards. There are some Druidical monuments in the neighbourhood of the town.

Cloyes is also on the road from Chartres to Tours, and on the Loir: it is a place of very little trade, with a population of about 1500. (Vaysse de Villiers.) Brou is on the Ozanne, which flows into the Loir: it had, in 1832, a population of 1870 for the town, or 2263 for the whole commune. The inhabitants make serges, and other light stuffs, and some of the fittings of weavers' looms. There are some marl-pits of considerable depth in the neighbourhood.

In the arrondissement of Nogent le Rotrou are Nogent le Rotrou, Authon, Beaumont le Chetif, Champrond, La Loupe or La Louppe, and Belhomer or Belhomert.

Nogent le Rotrou is on the road from Paris by Chartres to Le Mans, Angers, Nantes, and other places in the west of France, 33 miles from Chartres. It is a small town in a pleasant valley, watered by the Huine, on the left bank of which the town stands. It is a long place in proportion to its size. There is a castle, a picturesque ruin, which commands the town, and possesses some interest as having been the residence of Sully. There are three hospitals, one of them founded by Sully, who, as well as his wife, was buried here; but the tombs were violated during the Revolution, and the remains dispersed. The town had in 1832 a population of 5812, the commune of 6825: the manufactures are druggets, serges, and other light woollens, and cotton-yarn: there are several tan-yards, some tan-mills, and a dye-house. There are a public library, a high school, and an agricultural society.

Authon is near the source of the Ozanne: its inhabitants (1211, Dulaure) make serges, druggets, and other light woollens. Beaumont le Chetif (a village, according to some of our authorities) is between Brou and Nogent le Rotrou: its inhabitants (591, Dulaure) manufacture earthenware. Champrond is a village, according to some authorities, with 904 inhabitants (Dulaure), who trade in charcoal and wood. There are in the neighbourhood iron-mines, iron-works, and peat-pits. La Louppe and Belhomer are on the road from Dreux to Nogent: they are both small; Dulaure assigns to them a population of 1096 and 451 respectively. At La Louppe some business is done in horses, oxen, and sheep.

The department constitutes the diocese of Chartres, the bishop of which is a suffragan of the archbishop of Paris. It is comprehended in the jurisdiction of the Cour Royale of Paris, and in the circuit of the Conseil Académique of that city. It is in the first military division, of which the head-quarters are at Paris. It returns four members to the Chamber of Deputies. The state of education in the department is favourable as compared with the greater part of France. The number of male children at school is in the proportion of one for every seventeen inhabitants.

This department consists of the former district of Chartrain, and a portion of Dunois, both of which were comprehended in the county of Beauce or Beausse, and in the province of Orléanois; of a portion of Orléanois proper; of a considerable portion of the county of Perche, comprehended in the province of Maine; and of a small portion of the district Mantois, in the Ile de France.

EURI'BIA. [THECOSOMATA.]

EURI'PIDES of Athens is said to have been born at

Salamis in the year B.C. 480, on the day of the great victory obtained over the fleet of Xerxes. His father Mnesarchus and his mother Clito were among the refugees driven to Salamis by the progress of the invading army. They seem to have been Athenian citizens of the poorer class, as we find that the mean occupation of this poet's mother was made by Aristophanes one standing subject of the ridicule which he so perseveringly heaped upon him. Philochorus, on the contrary, says that he was of noble birth; but still his parents might be poor. (Suidas, Εὐριπίδης.) Euripides however found means to devote himself early and closely to the study of philosophy in the school of Anaxagoras, as well as to that of eloquence under Prodicus. While he was yet very young, the persecution and banishment of Anaxagoras appear to have deterred him from, or at least disgusted him with, the cultivation of philosophy as a profession, and combined with the strong natural bent of his genius to direct his exertions chiefly to dramatic composition. He is said to have commenced writing at the age of eighteen; and in the course of a long life he composed not fewer than seventy-five tragedies, or, according to other authorities, ninety-two, which rivalled in the public approbation the contemporary productions of Sophocles; and notwithstanding the constant and bitterly satirical attacks which, in the author's own time, they sustained from such as were exclusively and intolerantly attached to the elder tragic school, they secured him for all succeeding ages a place beside its two great masters. When upwards of seventy years old, weary, it should seem, of the feverish excitement in which he must have been kept alike by the petulant criticism and the turbulent applause that attended him at Athens, he accepted the invitation of Archelaus, king of Macedon, and went to live in honoured and tranquil retirement at his court. Here, however, a singular as well as tragical end awaited him. According to one account (for, in this as in many other matters of antient biography, there are discrepancies), he had spent three years in this retreat, when, walking one day in a solitary spot, he was met by some of the king's hounds, which, rushing furiously upon him, tore him so violently that he shortly after died in consequence of the laceration. Aulus Gellius tells us that the Athenians sent to Macedon to ask for the body of Euripides, but that the Macedonians constantly refused it, in order that their own country might retain the honour of the magnificent tomb which they erected for him at Pella, and which, according to Ammianus Marcellinus, was sanctified by the thunder-stroke, as Plutarch informs us had been the case with that of Lycurgus. Thus Athens was obliged to content herself with engraving the name of Euripides upon an empty monument, which in the time of Pausanias was yet standing beside the road from the Piræus to Athens (Pausan. *Attic.* 1, 2), near the tomb of Menander.

Of the numerous tragedies of Euripides, nineteen survive—a much larger proportion than has descended to us of the works of either of the two elder tragic masters. We have already [DRAMATIC ART, &c., vol. ix. p. 131] pointed out his 'Electra' to the reader's attention, not as a favourable specimen of the general powers of Euripides—for, indeed, as a work of art it is decidedly one of the least meritorious of his extant pieces,—but as affording the clearest point of comparison between his most prominently distinctive features as a dramatist and those of his two great predecessors; this being the only instance in which we have a piece from each and all of the three composed upon one and the same historical or mythological subject. 'Orestes,' the subject of which, inasmuch as it relates to the persecution of that hero by the furies of his mother and his proscription as a matricide, is the same as that of the 'Eumenides' of Æschylus, though in scene, incident, and character, excepting that of Orestes himself, they are wholly different, is more vigorous and more affecting than the 'Electra.' 'Iphigenia in Tauris' and 'Andromache' follow out still farther the fortunes of Orestes; both rank among those pieces of the second order in which the highest praise can be given only to certain portions. The same may be said of the six following pieces: the 'Troades,' the mournfully grand conclusion of which exhibits the captive Trojan women leaving Troy in flames behind them; 'Hecuba,' relating to the subsequent history of the captive queen; the 'Hercules Furens,' or 'Raging Hercules;' the 'Phœnissæ,' having the same historical groundwork as the 'Seven against Thebes' of Æschylus; the 'Heraclidæ,' which celebrates the Athenian protection of the children of Hercules, ancestors of the Lacedæmonian kings, from the persecution of Eurystheus; and the 'Supplices,' which in like manner commemorates the interment of the Seven before Thebes and their army, gained, on behalf of Adrastus, king of Argos, by a victory of the Athenians over the Thebans. 'Helen' is a very entertaining and singular drama, full of marvellous adventures and appearances, being founded on the assertion of the Egyptian priests that Helen had in fact remained concealed in Egypt, while Paris had merely carried off an airy semblance of her. The genuineness of 'Rhesus,' taken from the eleventh book of the 'Iliad,' has been much disputed, chiefly on the ground of its great relative inferiority—an argument which is outweighed by certain internal characteristics of the piece itself, combined with the external testimony of the antient writers ascribing it to Euripides. For beautiful morality and unaffected yet overpowering pathos, his 'Ion,' his 'Iphigenia in Aulis,' and above all, his 'Alcestis,' are peculiarly distinguished. He found subjects especially suited to the development of his finer powers in the purity and sanctity of the youth from whom the first of these three tragedies is named, in the unsuspecting innocence of the heroine of the second, and in the tender yet resolute devotedness of connubial affection portrayed in the third, to which Milton so beautifully alludes in his well-known sonnet, beginning

> 'Methought I saw my late espoused saint
> Brought to me like Alcestis from the grave,
> Whom Jove's great son to her glad husband gave,' &c.

The 'Hippolytus' and the 'Medea,' exhibiting all the romantic violence of irregular and vehement feminine passions, are deservedly celebrated among the greatest and most thoroughly successful achievements of this dramatist. In the former the heroism of Hippolytus is sublime as well as beautiful; and as regards the conduct of Phædra, as Schlegel has well remarked, it merits the highest commendation for the strict observance of moral propriety in a subject of so critical a nature. After the 'Hippolytus,' the same eminent critic is disposed to assign the next place among all the remaining works of Euripides to the 'Bacchæ,' on account of its harmonious unity, its well-sustained vigour, and of the appropriateness to the very peculiar subject here treated, of that luxuriance of ornament which Euripides constantly displays. This piece also merits especial attention as being the only one remaining of the *serious* dramas that were composed expressly and immediately in honour of Bacchus himself, the patron deity of the theatre. In this instance the glory and the power of Bacchus are not merely the occasion—they form the subject of the tragedy; and the wildly picturesque chorus of Bacchantes, as Schlegel observes, 'represent the infectious and tumultuous inspiration of the worship of Bacchus with great sensual power and vividness of conception.'

An interest yet more peculiar attaches to the 'Cyclops,' as being the sole remaining specimen of the *satyric* tragedy, so called from the chorus of satyrs, which formed an essential part of its composition. This, therefore, seems to be the fittest place in which to give a brief account of that particular and somewhat remarkable dramatic species. From this piece itself and from all collateral evidence, it is to be inferred that the satyric drama was never acted but as a kind of shorter and lighter after-piece, to relieve the minds of the audience, especially the ruder portion of them, after the grave impression of the serious performances: for which purpose, however, it seems to have been very constantly employed, each tragic trilogy being almost invariably accompanied by one of these shorter and lighter productions. Thus we find mention made of five satyric pieces of Æschylus, seven or eight of Sophocles, five of Euripides, besides a number of others by various minor authors. Notwithstanding its burlesque ingredients, the tragic character was so far preserved in the satyric play, that the subject appears to have been always historical, and the action partly serious, though with a fortunate catastrophe. No less than tragedy and comedy, the satyric drama had its peculiar and appropriate stage decorations, representing woods, caves, mountains, and other diversities of the sylvan landscape. Satyrs old and young, with Silenus in his various ages, were distinguished from one another by the variety of their grotesque masks, crowned with long shaggy goats' hair; while the satyrs were negligently clad in skins of beasts, and the Sileni decorated with garlands of flowers skilfully

woven." The satyr parts too appear to have been sometimes acted by pantomimic performers moving on a kind of stilts, to give more completely the appearance of goats' legs. The choral dance, it is hardly necessary to remark, was thoroughly rustic, peculiarly lively, and quite opposite in character to the solemn and impressive movements which accompanied the serious tragedy. The piece of Euripides has for its subject the adventure of Ulysses with Polyphemus, as related in the 'Odyssey,' with the addition of Silenus and his satyr band; the characters are accurately discriminated and consistently maintained; and the nature of the plot produces such natural contrasts and even blendings of the ludicrous with the horrible, as, above all things else, render this drama unique among the Grecian remains.

The editions of Euripides are numerous. The first edition, that of J. Laskaris, Florence, near the close of the fifteenth century, contains only the Medea, Hippolytus, Alcestis, and Andromache. That of Aldus, Venice, 1503, contains seventeen plays, among which is the Cyclops. Among subsequent editions are those by Canter, Antwerp, 1571; Barnes, Cambridge, 1694; Musgrave, Oxford, 1778; Beck, Leipzig, 1778-1788. The last complete editions are by Aug. Matthiä, Leipzig, 1813, and by F. H. Bothe, Leipzig, 1825. The editions of separate plays are also numerous; among which that of the Hecuba, Orestes, Phœnissæ, and Medea, by Porson, is the best known. Euripides has been translated into German by F. H. Bothe, and into English by Potter. There are also translations in German of several of the separate plays.

EUROPE is one of the great divisions of the globe, forming the north-western part of the old continent, of which it occupies a little more than two-seventeenths; Asia contains nearly nine-seventeenths, and Africa somewhat more than six. The surface of Europe is calculated to contain about 3,900,000 square miles, if Mount Caucasus and the river Ural are considered as forming the boundary-line between it and Asia.

The name 'Europe' first occurs in a poem attributed to Homer. Herodotus says he does not know how the name came to be given to our continent, except it be from Europa, the daughter of the king of Tyre; but he seems hardly satisfied with this explanation, and we have no other to offer. If the history of the discovery of America were lost we should have a similar difficulty in conjecturing how the New World obtained its name.

Europe is separated from America by the wide expanse of the Northern Atlantic, which washes its western and northern shores, and from Africa by the Mediterranean Sea. The boundary-line which divides Europe from Asia is only in part indicated by nature. This line runs through the Archipelago, the straits of the Dardanelles, the sea of Marmara, and the straits of Constantinople to the Black Sea, which is traversed by it. So far all geographers agree, but they do not agree as to the remaining part of the boundary-line. In the last century this line was drawn through the straits of Yenikale and the sea of Azof, and then along the river Don as far as the point where it approaches nearest to the river Volga, and afterwards along this river to its confluence with the Kama. It then followed the Kama to its sources in the Uralian Mountains, and was continued along the crest of this range to the source of the Kara, and thence along that river to the gulf of Kara.

This boundary-line is now abandoned as being too vague, and another is substituted for it. This new line traverses the Black Sea to the western extremity of Mount Caucasus, south of Anapa; it then runs along the watershed of this range, east-south-east to its eastern extremity, where it reaches the Caspian Sea at Soomgait, north of the peninsula of Absheran. Thence it runs through the Caspian Sea, which it leaves at the mouth of the river Ural, whose course it follows up to its sources in the Uralian Mountains. The Uralian Mountains and the river Kara constitute the remainder of this boundary-line.

The most northern point of the European continent is Cape Nord Kyn, in 71° 6′ N. lat.; North Cape, in 71° 10′, is on an island called Mageröe. The most southern points are Punta de Tarifa in Spain (36° N. lat.) and Cape Matapan (36° 17′) in Greece. The most western points are Cape St. Vincent (9° W. long.), Cape Roca (9° 28′), and Cape Finisterre (9° 27′). The most eastern point is in the Uralian Mountains, west of Ekatarinburg (60° 20′ E. long.). But some of the islands extend farther south and west than the continent. The most southern point of the island of Candia is 34° 55′ N. lat. The Blasket Islands on the west of Ireland lie in 10° 5′ W. long. Cape Fugleberg in Iceland is near 25° W. long., and the most western of the Azores, Corvo and Flores, 31° W. long. The most northern extremity of Nowaya Szemlia is about 77° N. lat. A straight line drawn from Cape S. Vincent to the mouth of the river Kara on the Frozen Ocean, the north eastern extremity of Europe, does not much exceed 3000 miles, and another drawn from Cape Matapan to Cape Nord Kyn, is 2400 miles long.

I. *Progress of Discovery.* The earliest notices of the history of Europe are in the writings of the Greeks, who inhabited the south-eastern corner of our continent. From this country the geographical knowledge of Europe extended by degrees to the west and north. Homer, who probably lived about 1000 years before the Christian æra, was acquainted with the countries round the Ægean Sea or Archipelago. He had also a pretty accurate general notion respecting those which lie on the south coast of the Black Sea; but what he says about the countries west of Greece, on the shores of the Mediterranean Sea, is a mixture of fable and truth, in which the fabulous part prevails. It would seem that in his age these seas were not yet visited by his countrymen, and that he obtained his knowledge from the Phœnicians, who had probably for some time sailed to these countries, but who, according to the common policy of trading nations, spread abroad false accounts of these unknown regions, in order to deter other nations from following their track and participating in the advantages of this distant commerce. It is probable also that the Phœnicians long excluded the Greeks from the navigation of the Mediterranean; for when the Greeks began to form settlements beyond their native country, they first occupied the shores of the Ægean, and afterwards those of the Black Sea. As the European shores of the Black Sea are not well adapted for agriculture, except a comparatively small tract of the peninsula of Crimea, their early settlements were mostly made on the Asiatic shores, and consequently little addition was made by these colonies to the geographical knowledge of Europe. But the navigation of the Phœnicians was checked in the middle of the sixth century before Christ, apparently by their country being subjugated by the Persians. About this time also the Greeks began to form settlements in the southern parts of Italy and on the Island of Sicily, and to navigate the Mediterranean Sea in its full extent. Accordingly we find that in the time of Herodotus (450 before Christ), not only the countries on each side of the Mediterranean Sea and the northern shores of the Black Sea were pretty well known to the Greeks, but that, following the track of the Phœnicians, they ventured to pass the Columns of Hercules, and to sail as far as the Cassiterides, or Tin Islands, by which name the south-western part of England must be understood. It is even reported that some of their navigators sailed through the English Channel and entered the North Sea, and perhaps even the Baltic. It must be observed however that Herodotus professes himself totally unacquainted with the islands called Cassiterides (iii. 115); and Strabo (104, &c.) expresses a very unfavourable opinion of the alleged northern voyages of Pytheas.

Thus a considerable part of the coasts of Europe was discovered, whilst the interior remained almost unknown. When the Romans began their conquests, this deficiency was partly filled up. The conquest of Italy was followed by that of Spain and the southern parts of France, and not long afterwards Sicily, Greece, and Macedonia were added. Cæsar conquered Gallia and the countries west of the river Rhine, together with the districts lying between the different arms by which that river enters the sea. His two expeditions into Britain made known also in some measure the nature of our island and its inhabitants. Thus in the course of little more than 200 years the interior of all those countries was discovered whose shores alone had been previously known. In the mean time nothing was added to the knowledge of the coasts, the Greeks having lost their spirit of discovery by sea with their liberty, and the Romans not being inclined to naval enterprise.

After the establishment of imperial power at Rome, the conquests of the Romans went on at a much slower rate, and the boundaries of the empire soon became stationary. This circumstance must be chiefly attributed to the nature

of the countries which were contiguous to the boundaries. The regions north of the Danube are mostly plains, and at that time were only inhabited by wandering nations, who could not be subjected to a regular government. Such at least are the countries extending between the Carpathian Mountains and the Black Sea; and therefore the conquest of Dacia by Trajan was of short continuance and speedily abandoned. The countries between the Alps and the Danube were soon added to the empire; but as the nations who inhabited the tracts north of that river had not yet given up a wandering life, they were enabled to elude the Roman yoke. The most important addition to the empire and to geographical knowledge was the conquest of England during the first century after Christ, to which, in the following century, the south of Scotland was added.

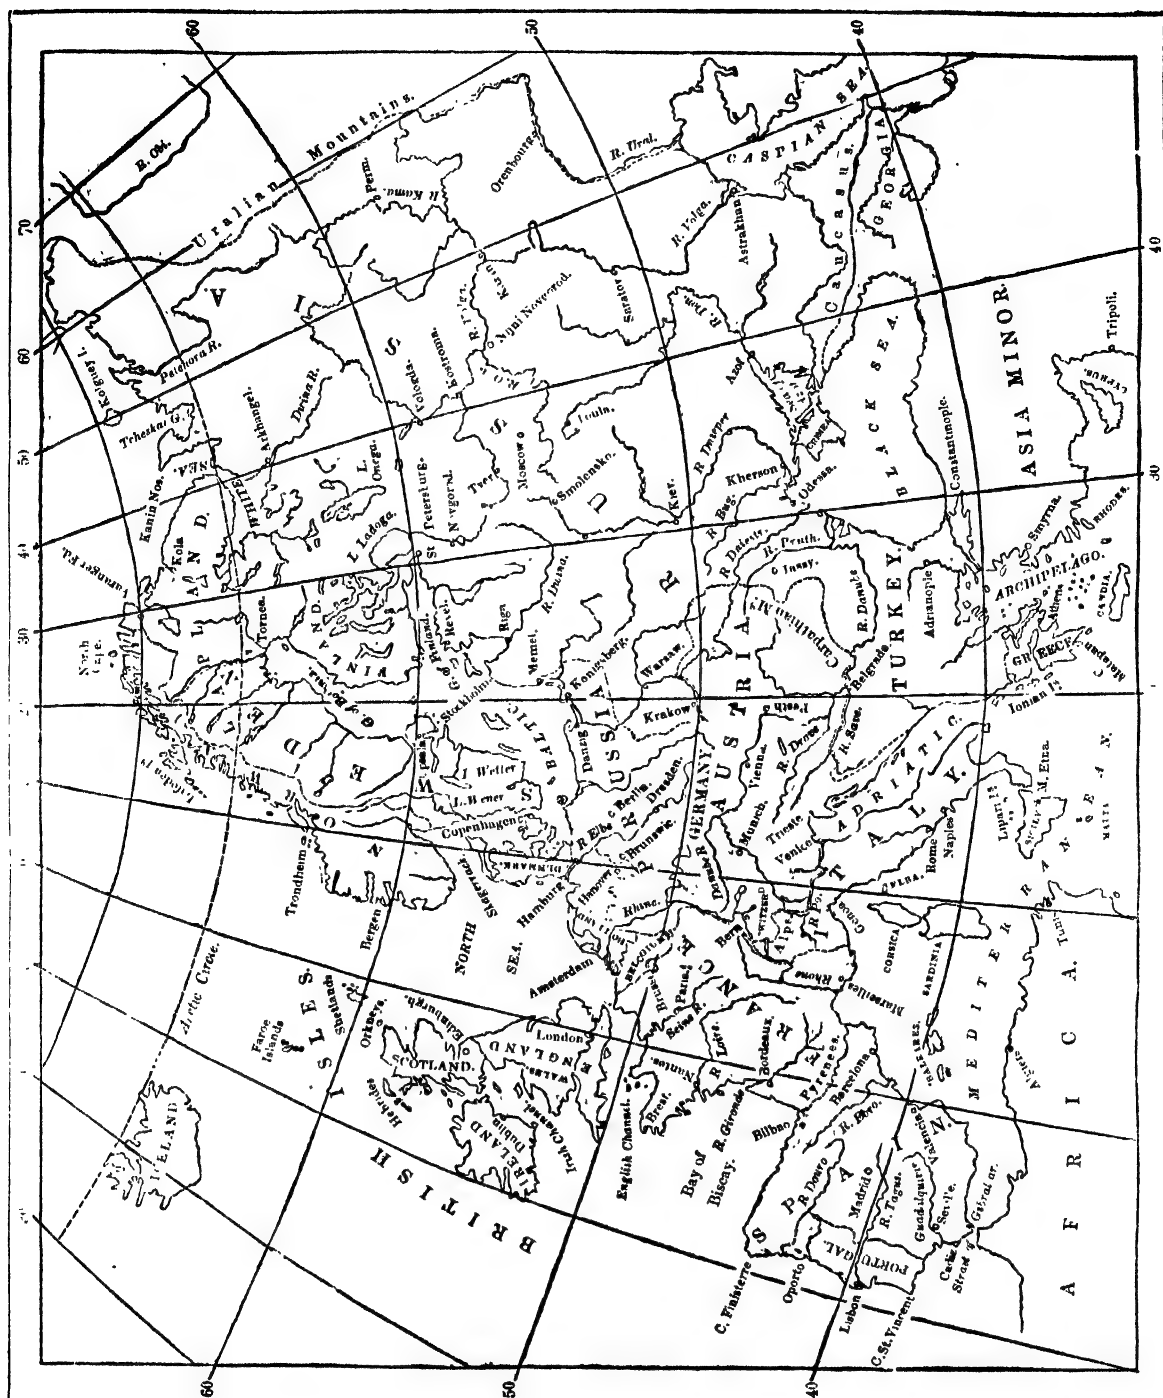
Nothing seems to have been added afterwards. The Geography of Ptolemy contains a considerable number of names of nations, places, and rivers in those countries, which were not subjected to the Romans. Probably they were obtained from natives, and from Roman traders who had ventured to penetrate beyond the boundaries of the empire. But these brief notices are very vague, and in most cases it is very difficult to determine what places and positions are indicated.

The overthrow of the Roman empire by the northern barbarians destroyed a large part of the geographical knowledge previously obtained, except perhaps as to that portion of Germany which was subject to the Franks, which by degrees became better known than it was before. But two sets of men soon made their appearance, who contributed largely to extend the geographical knowledge of Europe—missionaries and pirates. The Christian religion had been introduced into all the countries subject to the Roman power. The barbarians who subverted the empire soon became converts to the Christian faith, and some of them ventured among other barbarous nations for the purpose of converting them also. They visited the natives who inhabited the eastern parts of Germany, but here their progress was at first slow; they did not cross the river Oder, or at least they did not venture far beyond it, and the geographical knowledge of this part of Europe was consequently not much increased. The progress of those missionaries was more important who penetrated from Constantinople into the interior of Russia, where they succeeded in converting to the Greek church the different tribes into which the Russians were then divided. This was effected in the ninth century. In the tenth the western missionaries got into Poland, and its inhabitants by degrees became converts. In the beginning of the thirteenth century the Prussians and Lithuanians had not been converted to Christianity, and the attempts of the missionaries were for a long time abortive. Christianity was however introduced among the Prussians during the thirteenth century by force of arms, the knights of St. John having conquered the country. The Lithuanians were the last to embrace Christianity, which was effected by a stroke of policy: their sovereign acquired the crown of Poland by embracing the new faith.

To the pirates we are indebted for our acquaintance with the northern parts of Europe, especially the Scandinavian peninsula; but this was not owing to pirates who went to but to pirates who came from these countries. The Northmen or Normans, who inhabited Denmark, Norway, and Sweden, first laid waste and then settled in part of France, and afterwards conquered England. In their new settlements they maintained a communication with their native countries, which thus gradually became known wherever the Normans had settled.

It is worthy of remark, that no part of Europe has been discovered or explored by travellers who went for that sole purpose. We must however make an honourable exception in favour of Alfred the Great, who sent two noblemen to explore the countries around the Baltic Sea; and in the account of one of them, Other, or Otter, we find the first accurate notions respecting these regions, especially Prussia, more than 300 years before the Prussians were converted to Christianity.

II. *Surveys of Europe.* In the beginning of the last century trigonometrical surveys were first made with the view of constructing accurate maps. The first of these surveys was made in France under Cassini. Since that time other European governments have caused some parts at least of their respective territories to be surveyed, especially Prussia and Austria. England followed in the same steps towards the beginning of the present century, and to this great national undertaking we owe the publication of the Ordnance Maps. The southern parts of Sweden and Norway have likewise been surveyed. Thus we are now in possession of very exact maps of nearly one-half of Europe. The maps of the other countries of Europe rest on the partial surveys of particular districts, and on a greater or less number of astronomical observations; by means of which those parts which have not been surveyed can still be laid down within certain limits of accuracy. Though maps of this latter kind cannot altogether be relied on, the attention paid by all governments to their gradual improvement has been sufficient to correct very gross errors, and thus these maps have by successive and partial improvements attained a certain degree of correctness.



The great increase in commerce and navigation in modern times has convinced the respective governments of Europe of the necessity of a minute and accurate survey of their coasts. But all the coasts of Europe have not been surveyed, though more than half of them have been accurately laid down. The greatest part of the coast of Iceland has been surveyed by the Danish government, and this survey is still going on. The whole western coast of Norway, and east of Cape Lindesnaes, as far as the harbour of Christiansand, was surveyed by the Danes fifty or sixty years ago, but this survey is not considered accurate. The Baltic, including the Kattegat, has been surveyed by the governments to which the coasts belong, but not minutely, nor is the survey considered accurate. The coast between the mouth of the river Elbe and the Dollart was surveyed by the French, and continued to the Schelde by the Dutch. The coast between the Schelde and Gravelines was surveyed by the French, while the English ascertained the outer dangers.

Our government has shown great activity in surveying the British coasts. A minute and accurate survey has been made of the whole eastern coast of Great Britain south of the Murray Frith, and of the whole southern coast, except the tract between Sidmouth and Plymouth. The western coast, including the Bristol Channel, has been surveyed as far as Bardsey Island, and again between Holyhead and Liverpool. Farther north only the Solway Frith is partly surveyed. The coast of Ireland has been surveyed between Dublin Bay and Donegal Bay, inclusive, along the northern shores of the island. The Shetland and Scilly Islands, as well as Guernsey, Jersey, Alderney, &c., have been surveyed completely, but the survey of the Orkneys is not yet terminated.

The coast of France has been surveyed by the French government from the Strait of Dover to Bayonne, except a part of the coast of the Bay of Biscay from about Belle Isle to the Isle of Ré. Most of the harbours on the coast of Spain have been minutely surveyed by the Spanish government.

Most of the islands in the Mediterranean have been surveyed; Corsica and Elba by the French, Sicily and Sardinia by the English. The survey of the Adriatic has been completed by the Austrians and English co-operating. From the Adriatic to the Archipelago the coast has been surveyed by the English, and they have also carried on a survey through the islands and coasts of the Archipelago, which is nearly completed.

III. *Physical Geography.* Nearly two-thirds of the surface of Europe consist of an immense plain; the remainder is partly mountainous, and partly hilly. The plain occupies the east part of the continent; and the hilly and mountainous countries extend along its western and southern shores. On the eastern boundary the plain extends across the whole continent from south to north, from the mountain-range of the Caucasus and the shores of the Black Sea to those of the Arctic Ocean. In width it extends in this part of the continent from the Ural Mountains to 26° E. long. To the west of this meridian it terminates on the north on the shores of the Baltic, and in the mountain-region of Scandinavia; on the south it continues along the southern shores of the Baltic, and extends even farther west to the shores of Holland opposite the British Islands. If small eminences are not taken into account, it may even be said to continue in a south-west direction through Belgium and the northern parts of France to the banks of the Seine, where it terminates between Paris and the mouth of the river. The portion of the plain, west of the meridian of 26°, is narrowed on the south by the Carpathian Mountains, and other ranges which

are connected with them. Towards the eastern part it extends over ten degrees of latitude, but in its progress towards the west it becomes gradually narrower, partly owing to the mountains advancing farther north, and partly also owing to the seas which form its northern border running farther to the south. Here its mean breadth does not exceed three degrees of latitude, except where the peninsula of Jutland joins it. Along the coast of the North Sea it is still narrower.

By this narrow portion of the Great European Plain and the Baltic (which may be considered as its lowest part, being covered with water), the mountain-regions which constitute the western portion of the Continent are divided into two separate systems. To the north lies the system of the Scandinavian Mountains, and to the south what we shall here call the South European Mountain System.

The Great Plain occupies about 2,500,000 square miles, the South European Mountain Region 1,100,000, and the Scandinavian Mountain System about 300,000 square miles.

Scandinavian Mountain System.—This comprehends the whole of the Scandinavian peninsula, or Sweden and Norway. A line drawn from the mouth of the river Torneo, at the most northern angle of the Gulf of Bothnia, to the Waranger Fiord, a bay of the Arctic Ocean, would separate it from the north-western part of the Great Plain. A huge mountain-mass occupies the west part of this peninsula. It rises on the very shores of the sea to a height of some hundred feet, and attains, at a short distance from it, an elevation of 3000 or 4000 feet, and frequently more. South of 63° N. lat. it has not the form of a mountain-range, but of a mountain-plain, its surface frequently presenting a perfect level, and in some places swelling into hills. This elevated plain is from 100 to 150 miles across, and as it attains in many parts the line of perpetual congelation, which in this latitude is about 4200 feet above the sea, a great portion of

it is always covered with snow; while other districts, where the snow melts during several weeks in every year, afford pasture-ground. On the plain there rise a small number of summits, among which the Skagstölstind attains 8400 and the Sneehätten 8200 feet. The western side of the plain is indented by deep inlets of the sea, which penetrate from 30 to 60 miles, and even more, inland: the eastern side is furrowed by narrow and deep valleys, of nearly the same length.

North of 63° N. lat. the masses of rocks take the form of a high ridge, the summits of which however rarely extend more than a few miles, and frequently present a sharp-edged crest. Their ascent on the side towards the Atlantic Ocean is rapid and frequently precipitous, a character which increases as we advance farther north, because the highest part of the range gradually approaches the ocean till it constitutes its very shores. The highest summit is the Sulitelma, which rises to more than 6000 feet; but many other parts exceed the snow-line, which varies between 2000 and 3000 feet, and towards the north sinks much lower.

The country to the east of this range, and at the base of it, is more than 1000 feet above the sea, and descends towards the Gulf of Bothnia in long slopes, interrupted by small level plains, and intersected here and there by ridges of hills, running in the direction of the slopes, and approaching in some parts to the shores of the gulf.

Mount Sylthfiellen is on the northernmost extremity of the mountain plain, where it begins to contract to the dimensions of a range. It stands near 63° N. lat., and attains the height of 6486 feet above the sea. From it, as from a common centre, branch off several ridges to the east, south-east, south and south-west, and though they soon sink down to hills, they continue through the south-eastern part of the peninsula, the mean elevation of which is from 300 to 400 feet above the sea, and above which the hills rise a few hundred feet. The Scandinavian ridges enclose the great lakes of Mälarn, Wenern, and Wettern. To the south of the last lake these ridges unite, and form the table-land of Småland, whose surface is on an average about 500 feet above the sea, and which constitutes the most southern extremity of the Scandinavian system. It descends with a gentle slope towards the east, but very rapidly to the south and west. The peninsula of Scania, which joins it on the south, is low and flat.

The Färoe Islands, which are between Norway, Cape Wrath in Scotland, and Iceland, and nearly equidistant from these three countries, resemble in their conformation the rocky plain of South Scandinavia, rising abruptly from the sea to more than 1000 feet, and presenting on their summits, at an elevation of more than 3000 feet above the sea, generally a level surface. This seems also to be the case with the south-eastern part of Iceland, which is called the Klofa Yökul, where a surface of more than 8000 square miles has never been explored, probably owing to the thick layer of snow which has accumulated on a mountain-plain which rises above the snow-line (3000 feet). The western and northern districts of Iceland, which in general rise only to a moderate elevation, though some isolated ridges and summits attain the snow-line, seem to be the produce of that active volcanic agency which has frequently laid waste this portion of Iceland.

Though the Scandinavian Mountains are not visibly connected with the South European Mountain system, we may perhaps be excused in considering the island of Great Britain as forming such a link. The most northern part of Scotland lies in the same parallel with the southern part of the Scandinavian mountain-plain, and bears a considerable resemblance to it in configuration, consisting of one enormous mass of high rocks, which rise abruptly from the sea, and exhibit on their surface extensive plains, sometimes flat and sometimes diversified with eminences. These plains however are not covered with snow, as they do not rise above 2000 feet, and sometimes attain only 1000 feet, or a little more, an elevation which falls considerably short of the snow-line. This description is applicable to the whole of Scotland north of the Central Grampians (57° N. lat.), with the exception of the greater part of the counties of Caithness and Aberdeen. Even to the south of 57° N. lat. we meet with an elevated plain, about 1000 feet above the sea, which, under the name of the Moor of Rannoch, extends more than thirty miles in every direction between Ben Cruachan and the southern chain of the Grampians. But farther south the Scandinavian character of the country is lost, and the surface presents the broken character of ridges, valleys, and plains, by which the most northern portion of the South European mountain system is distinguished. This character of the country softens gradually as we proceed farther south. Between 57° and 54° N. lat. the plains are generally of small extent, and a great number of summits rise to 1000, 2000, and sometimes even to 3000 feet and upwards above the sea. South of 54° N. lat. however these lofty elevations, and the comparatively narrow valleys which accompany them, occur only along the western coast of Great Britain, in Wales, and the counties of Devon and Cornwall. East of the Severn the hills do not generally rise so high as 1000 feet, nor are their slopes abrupt; the whole surface consists of gentle swellings and slopes, with wide levels between them. Towards the North Sea it sinks down entirely, and forms (with few interruptions not worth mention in this general survey) a great plain, which occupies the counties of Lincoln, Cambridge, Huntingdon, Norfolk, Suffolk, and Essex. As these flats lie opposite to the western extremity of the Great European Plain, one might imagine that they are a continuation of that plain, and that in the island of Great Britain the three great systems which occupy Europe have their representatives. South of the Thames the country resumes its undulating surface, and approaches in its form to those districts of France which extend along the southern shores of the Channel.

South European Mountain System.—This system, which extends over the whole of South Europe, from Cape La Roca in Portugal to the Straits of Constantinople, presents a surface more diversified in its form than any other portion of the globe of equal extent, China perhaps excepted.

To give greater perspicuity to our description, we shall follow the natural division made by a valley which traverses the whole of this mountain-system from north to south, between 4° and 8° E. long. In the northern part of the valley flows the Rhine from Basel northwards, in the southern the Rhone from Lyon southwards. The middle portion of the valley is occupied by the vale through which the Saone, a tributary of the Rhone, and the Doubs, a branch of the Saone, have their course. The most northern bend of the Doubs lies nearly under the same parallel as Basel, and less than thirty miles from it. In this part there occurs a great depression in the mountains, which divide the Rhine from the Doubs, and the French government have taken advantage of it, by carrying through this depression a canal, which is called the Rhone and Rhine canal, and which unites the Doubs to the Ill, a tributary of the Rhine. The highest part of this canal is nearly 1760 feet above the sea.

In the region which lies west of this long transverse valley, nature has effected another natural division, by forming across the continent a wide plain, skirting the northern side of the Pyrenees, and extending from the Bay of Biscay to the Mediterranean. The western part of this plain is low and flat, and drained by the river Garonne; the eastern is traversed by low hills, but does not rise much higher than the western part. The canal of Languedoc, which is made through this portion of the plain, and unites the Garonne with the Mediterranean Sea, attains at its greatest elevation about 600 feet above the sea.

South of this plain the mountain-chain of the Pyrenees rises with a rapid ascent, and runs across the whole continent from the Bay of Biscay to the Mediterranean. In its central parts it attains a mean elevation of about 6000 or 7000 feet, but a much less height towards its two extremities. The highest summits are upwards of 11,000 feet high, as the Mont-perdu (11,282), the Maladeta (11,500), and there are many more which exceed 10,000 feet. The southern declivity runs out in long mountainous slopes, intersected by deep valleys, and terminates on the banks of the river Ebro. Not far from the western extremity of the Pyrenees another chain branches off, which may be considered as its continuation, since it runs directly to the west. As far as 6° W. lat. it is a single chain, with short offsets, but west of that meridian it divides into several ranges, which traverse the north-western part of Spain in different directions, and terminate respectively at the capes of Ortegal, Finisterre, and Silleiro. This chain, which may be called the Cantabrian range, rises in its eastern parts to about 4000 or 5000 feet, but west of 5° W. lat. it attains a height of 5000 or 6000 feet, and even more.

South of these ranges extends the table-land of Spain, the highest parts of which occur between 1° and 4° W. long., where they are from 2000 to 2500 feet above the level of

the sea. The country east of this line descends rapidly, but in high chains of hills, which contain some mountain summits, to the Mediterranean. On the highest part of the table-land also, a few high mountains occur, as the Sierra Urbion, which rises to 7272, and the Sierra Molina, to 4500 feet, but they do not form continuous chains. The country west of them is a plain, which presents a large extent of level ground, in some places a hilly surface, and in others ridges about 1000 feet above their base. Such are the ridges which divide the basin of the river Tajo from that of the Guadiana. But between the Tajo and the Duero the dividing ridge rises to 5000 or 6000 feet, and attains in the Sierra de Gredos even the elevation of 10,548 feet. In its continuation towards the Atlantic is the Serra d'Estrella, 7524 feet high; and even the Serra do Junto, not far from its termination at Cabo da Roca, is 2319 feet above the sea.

The Sierra Morena, which divides the basins of the rivers Guadiana and Guadalquivir, forms the southern boundary of the table-land. It does not however rise much above it, the mean elevation of this range varying between 3000 and 4000 feet. South of the Sierra Morena the country sinks considerably to the valley of the Guadalquivir, which, in its upper part is only about 1000 feet above the sea, and in its lower course traverses an extensive level plain, which, near the sea, is covered with swamps.

This valley is divided from the Mediterranean by a long chain of mountains running east and west, a considerable part of which is always covered with snow, and has therefore received the appropriate name of Sierra Nevada. The highest summits occur between 3° and 4° W. long., and are the Cerro de Mulhacen (11,660 feet high), Cerro de Machos (11,096), Cerro de Veleta (11,387), Cerro de Caldera (10,793), and Cerro de Fajos Altos (10,778). Many other summits exceed the snow-line, which, in this latitude, is about 9000 feet above the sea.

The country between the plain of the Garonne and the valleys of the Rhone and Rhine presents a different character. It contains also an elevated region, rising to between 2000 and 3000 feet above the level of the sea. But this region is of comparatively small extent, being included between 44° and 46° N. lat., and between 1° and 4° E. long. On its surface rise three chains of mountains, which enclose the valleys of the Allier and of the Upper Loire. The most western part is called the mountains of Auvergne, the middle the mountains of Forez, and the eastern range the Cevennes. The mountains of Auvergne, which exhibit unequivocal signs of volcanic origin, rise in Mount Cantal to 6090 feet, in Mont d'Or to 6200, and in Puy de Dôme to 4840 feet. The country west of them continues high and hilly, but gradually declines in elevation as far as the source of the Charente, from which point to the sea it extends in a low and level plain. The mountains of Forez rise in the Pierre Haute to 6200, and in the Mount Magdalene to 4800 feet. The two chains terminate about 46½° N. lat., near the town of Moulins, on the Allier: the country extending to the north and north-west of them has an undulating surface, resembling that of the southern counties of England; it varies from 200 to 300 feet above the level of the sea, and does not exhibit ranges of hills, except in the south of Normandie and in Bretagne, where the hills rise from 1000 to 1500 feet above the sea.

The Cevennes, which separate the valley of the Upper Loire from that of the Rhone, rise in Mount Mezin to 5820 feet, in Mount Pilate to 3516 feet, and in Mount Tarare to 4756 feet. South of 47° N. lat. they sink down to the level country, and through the depression thus formed runs the Canal du Centre. North of this canal the chain rises again, but to a less elevation, and is here called the Côte d'Or, which, between 47° and 48° N. lat., terminates in a hilly plain, called the Plateau de Langres. On this plain, which may be about 1000 feet above the sea, several of the rivers of France take their rise, and among others the Seine. From the north-eastern part of this plain issues a chain of low hills, called Monts Faucilles, which, at 48° N. lat., extend eastward till they meet the higher range of the Vosges mountains, which rise in the Ballon de Sulz to 4560 feet. The chain of the Vosges runs parallel to the Rhine and terminates at a short distance from the town of Mayence, in the Mont Tonnerre, or Donnersberg, 2656 feet high. West of this chain, as far as the Côte d'Argonne (a range of high hills which issues from the western extremity of the Monts Faucilles, and separates the valley of the Meuse from the sources of the eastern tributaries of the Seine), extends a rugged country, intersected by valleys and chains of hills, running in a northern direction, and terminating in the Ardennes and the Eifel, which are hilly and rugged plains, about 1800 feet above the level of the sea, occupying the space between the Meuse and the Rhine as far north as 50½° N. lat. West of the Côte d'Argonne extend the dry chalk-plains of Champagne, which gradually subside in the level country which occupies the north of France (the departments of Seine and Marne, Aisne, Oise, Seine Inférieure, Somme, Artois, and Nord), and joins that of Belgium. On this plain only a few hills, and those of very moderate elevation, occur at considerable intervals.

We pass now to that portion of the south European mountain system which lies to the east of the valleys of the Rhone and of the Rhine. Here we find the mountain system of the Alps, which extend from the banks of the Rhone as far east as 18° E. long., and cover an immense tract of country, measuring on an average about 130 miles across. The Alps may be divided into the Higher and Lower Alps. The Higher Alps extend to about 13° E. long., and the Lower between 13° and 18°.

The Higher Alps have the form of a quadrant, beginning on the shores of the Mediterranean, and running first due north, but gradually declining to the east, until they run due east, in which direction about one half of their course continues. Their mean breadth does not exceed 100 miles. Many hundred summits, perhaps not less than a thousand, rise above the snow-line, which here is found at somewhat more than 8000 feet above the sea. The highest summits are Mont Blanc (15,748 feet), Mont Rosa (15,170), and Mont Cervin 14,778 feet above the sea. The valleys by which these mountains are intersected are narrow, and sink down to 2500 and 2000 feet, and still lower.

The Lower Alps do not rise to so great an elevation, few of the summits attaining the snow line; the highest summit is Mont Terglou, near the sources of the Save, which is 9380 feet above the sea. But the space occupied by these mountains widens considerably as they proceed eastward; between 15° and 16° E. long. they are upwards of 200 miles across, and fill up the whole country between the Adriatic Sea and the Danube. They form also several chains running east and west, between which there are wide longitudinal valleys. East of 16° E. long., where they approach the mountain system of the Balkan, they narrow to about 80 miles, and continue to run along the Adriatic Sea.

The Alps descend with a rapid slope southward to the plain of Lombardy, which extends from the western part of the Higher Alps to the Adriatic. Its length is about 250 miles, with an average breadth of about 50. Its western and higher districts are about 400 feet above the sea, but it gradually subsides as it advances east, till it terminates in a low sandy shore. It is mostly a dead flat, of great fertility, and very well cultivated.

South of this plain extend the Apennines, a mountain-range which, at its western extremity, joins the most southern part of the Higher Alps, and runs in one chain eastward along the plain of Lombardy, from which it rises with a steep ascent. It afterwards turns south and traverses, in different chains, the peninsula of Italy, terminating at its most southern extremity, the Capo dell'Armi, on the straits of Messina, with the Monte Aspro, 5300 feet. The highest part of this range is between 43° and 42° N. lat., where the Monte Corno or Gran Sasso d'Italia rises to 9510 and the Monte Sibilla to 7200 feet. The valleys, which are included between its several ranges, are wide and fertile In some places the mountains do not extend to the shores of the sea, but leave spacious plains, as is the case along the Adriatic, north of 44°, and again between 42° and 43°. The latter plain, called the Tavogliera de la Puglia, is a savanna, without trees, and of very indifferent fertility. Along the Mediterranean occurs the plain of Terra di Lavoro, in which the town of Naples and Mount Vesuvius are situated, one of the most fertile spots of Europe or the world. Many of the mountainous districts along the Mediterranean are covered with lava.

The Island of Sicily, which is separated from Italy by the strait of Messina, has a hilly surface. Along the northern coast there runs a chain of low mountains, which, in Mount Madonia, rise to 3788 feet. Unconnected with this chain is the volcano of Mount Ætna, which attains an elevation of 10,800 feet above the sea. Between the hills, with which Sicily is studded, and sometimes on their very tops, there

are plains of moderate extent, which are sometimes nearly .000 feet above the sea.

The island of Sardinia consists of two chains of mountains running north and south, and an elevated valley between them. The eastern chain, which is the higher, rises in Mount Schimschiu to 6000, and in the Lyubarra mountains to 5768 feet. The western chain probably does not exceed 3000 feet in elevation. Along the coast there are some low swampy tracts.

The island of Corsica is still more mountainous. If a few small tracts along the eastern shores are excepted, which are covered with swamps, it is everywhere studded with high hills and ridges of mountains. Some of the summits attain a great height. Monte Rotondo is 9060, and Monte Paglia Orba 8691 feet above the sea. The valleys are numerous but very narrow, and of indifferent fertility.

Passing to the countries north of the Alps we find that this great mountain-system, at its western extremity, is bounded on the north by the river Rhone, from the point where it issues from the lake of Geneva to its junction with he river Saone. Immediately north of the Rhone there rises another chain of mountains, different in character and n elevation, called the Jura. This chain extends from the banks of the Rhone, in a north-east direction, to the river Rhine, on whose banks it terminates between the mouth of the river Aar and the town of Basel. Its length may be about 160 miles, and its width less than 20 on an average. It consists of a number of parallel ridges, rising 1000 feet and more on a base which is nearly 3000 feet above the sea. Some of the summits exceed 5000 feet in absolute elevation. The highest are towards the southern extremity of the range. The Pré des Marmiers attains 5640, Reculet 5619, and the Dôle 5500 feet.

Along the south-east side of the Jura, and between it and the Alps, extends the plain of Switzerland, beginning on the shores of the lake of Geneva and terminating on those of the lake of Constance. This plain is between 1250 and 1350 feet above the level of the sea. At each extremity some hills rise to a considerable height, but the central districts exhibit only a strongly undulating surface. Its length may be about 180, but its width does not exceed 20 miles.

Opposite the northern extremity of the Jura, but on the northern banks of the Rhine, rises the Black Forest, a mountain-range, about 20 miles across, which runs parallel to the Rhine, and whose western sides approach the river sometimes within three or four miles. It terminates on the banks of the river Neckar. Its length may be between 130 and 140 miles. The upper part of this range extends in wide plains more than 3000 feet above the sea; the number of summits which rise above these plains is not great. The Feldberg attains 4912 feet, and the Kandel 4160 feet above the sea. The Odenwald, which extends between the Neckar and Mayn, in the same direction, may be considered as its continuation, but it does not attain an equal elevation, its highest summit, the Katzenbuckel, rising only to 2000 feet.

Between the Black Forest and the Odenwald on the east, and the Vosges mountains on the west, lies the valley of the Rhine, which is about 20 miles in width, but the length from Basel to Mayence is not less than 200 miles. At its upper extremity it is 800 feet, but at its lower hardly more than 400 feet above the sea. This valley presents a level surface of great fertility.

The Rhine, below the great cataract of Schafhausen, is not more than 1000 feet above the level of the sea; but the Danube, at Danaueshingen, nearly under the same meridian, is 2200 feet above it; yet between both rivers no mountain-range occurs. With only a hilly surface, and in an extent of hardly 15 miles, the country rises more than 1200 feet. This hilly country may be considered as the commencement of the elevated plain of Bavaria, which extends from the foot of the Alps (about 47½° N. lat.), between the Black Forest and Odenwald on the west and the Böhmerwald (forest of Bohemia) and Fichtelgebirge on the east, to the Thüringer Wald and the Rhöngebirge (51° N. lat.). The length of this plain is about 180 miles, and its breadth about the same. The western part of the plain, which joins the Black Forest, is hilly, and intersected by a mountain-ridge, called the Rauhe Alp, which runs along the northern bank of the Danube for 70 or 80 miles, with a mean width of about 16 miles. South of this ridge the country is nearly 2000 feet above the sea, but north of it less than 1000 feet. The eastern part of the plain, south of the Danube, is nearly a level, which sinks gradually and almost imperceptibly from the foot of the Alps towards the river. The town of Munich, which nearly occupies its centre, is 1664 feet above the sea, and Ratisbon, on the Danube, more than 1000 feet. That part of the plain which lies north of the Danube has an undulating surface, upon which some hills rise towards the banks of the river Mayn. From the banks of the Danube the country rises slowly, but hardly more than 150 feet above the river, when it forms the water-shed between the Danube and Mayn, and begins to subside towards the bank of the last-mentioned river, where it is only from 600 to 800 feet above the sea.

The elevated plain of Bavaria does not extend far enough north to reach the Great Plain, being divided from it by a mountain-region which extends between 50½° and 52° N. lat. over the whole of Germany, from the very banks of the Rhine to the Fichtelgebirge and Erzgebirge. This region, which has a width of about 100 miles, contains a great number of ridges, bearing different names. Their mean elevation is about 3000 feet, and the highest summits attain upwards of 4000. The most northern of these ridges is the Harz. For a more peculiar account of them we refer to GERMANY.

The countries which we have hitherto considered are to the north of the Higher Alps. To the north of the Lower Alps, and divided from them only by the narrow valley of the Danube, is another system of mountains, which encloses, in the form of a quadrilateral figure, the kingdom of Bohemia, and might therefore be called the Bohemian mountains. The several ridges of which it consists have different names. They attain a mean elevation of 3000 or 3500 feet above the sea; their highest summits rarely exceed 5000 feet. The great valley of Bohemia, which is enclosed by these ridges, is subdivided into numerous smaller valleys by the lower ridges, which advance into it from those which surround it. Near the higher ridges the surface of these valleys is 1500 feet and upwards above the sea, but they subside rapidly towards the middle of the great valley, where they are not more than 700 and 900 feet above the sea. Where the Elbe carries off the waters of Bohemia it is somewhat less than 400 feet above the sea.

At the eastern extremity of this mountain-system, where the rivers Oder and Morava take their origin, the Carpathian Mountains commence. They run first due east, then decline to the south-east, and when in that direction the range has passed 26° E. long., it turns suddenly to the west, and having proceeded in that direction to 23° E. long. it gradually declines to the south, and terminates on the banks of the Danube on both sides of the meridian of 22°. The length of this range does not fall much short of 800 miles; its breadth is not very considerable, in a few places only exceeding 70 or 80 miles. Its mean elevation may be between 3000 and 4000 feet; but in two places it rises much higher: Tatra Mount, which is intersected by 20° E. long., is an enormous mass of rock, about 50 miles long and 30 wide in the central parts, whose surface is about 7000 feet above the sea. Above this huge mass there rise about ten peaks which exceed 8000 feet. The highest is the Peak of Lomnitz, which rises to 8675 feet above the sea. The Peak of Eisthal (dale of ice) is 8640, and the Krywan 8150 feet high. Elevated summits occur again on the most southern part of the range, where the Buzesd attains 8700 feet, and Mount Surul 7572 feet. Towards the great plain, and on the north and east, the range sinks with gentle slopes, forming no offsets, except a few short ones at the sources of the rivers Pruth, Serith, and Suezava, between 47° and 48½° N. lat. But some considerable offsets occur towards the two extremities of the range. Four chains are detached from it between 18° and 20° E. long., which run southward and terminate not far from the banks of the Danube, after traversing the north-western part of Hungary: they are comprehended under the general term of Hungarian Ore Mountains, from their being rich in gold and silver ore. The valleys between them are wide and fertile. No considerable chain branches off from the middle part of the range, but from its eastern extremity four or five ridges issue: these ridges running in a western direction some hundred miles, traverse Transylvania, and render the whole of this country a succession of mountains and wide valleys, which are generally very fertile.

Between these offsets of the Carpathians on the east, the principal range, and the Hungarian Ore Mountains on the north, and the eastern termination of the Alps (16° E. long.), lies the plain of Hungary, the most extensive that is

included within the South European mountain-system. It extends from north to south about 300 miles, and its mean breadth is not less. The Danube traverses it. To the west of the Danube is a small range on the plain, the Bakony Mountains, which rise in their highest part somewhat more than 2000 feet; and farther south (near 46° N. lat.), the hills of Fünfkirchen occur: but both these ranges occupy only a small surface. The plain east of the Danube is a dead flat. That portion which lies west of the Danube is fertile, as well as that which skirts the Hungarian Ore Mountains, but by far the greatest part of it is either covered with sand or swampy, and affords only indifferent pasture. This great plain towards the south is only 300 feet above the sea, but towards the north it rises to 400 and 450 feet.

South of the Carpathian Mountains, and between them and the lower course of the Danube, extends the plain of Wallachia, 250 miles in length from west to east, and about 100 miles in breadth. It is generally level, but towards the mountains undulating; in its lower parts along the Danube it is only about 100 feet above the sea. It is of great fertility, but in many places swampy.

The third great division of the South European mountain-system is formed by the Balkan, which, with its numerous branches, traverses the most eastern of the three great southern peninsulas, which advance from the body of the continent into the Mediterranean Sea. The Balkan range is not disjoined from the Alps by any natural separation, but is so closely connected with them as to form a continuation of that mountain-system. Geographers have however assumed a dividing line about 18° E. long.

From this line the principal range of the Balkan runs in a south-east direction till it reaches 22° E. long., from which point it continues in a general due east direction till it terminates on the shores of the Black Sea in Cape Eminch. The length of this chain may be about 600 miles. Its elevation is considerable west of 24° E. long., especially between 22° and 24° E. long., where a great part of the chain, called here Shardagh (Scardus) and Egrisu Dagh, is covered with perpetual snow, which shows that it must rise at least to 9000 feet. East of 24° E. long. it does not rise so high, and it is supposed that in this part its mean elevation varies between 3000 and 4000 feet. The extent of country covered with this range and its numerous branches is very great. West of 24° E. long., all the immense tract which lies between the Save and Danube on the north and the Adriatic as far south as Cape Linguetta or Karaburnu, presents nothing but a continuous succession of high mountains and generally very narrow valleys, and is probably the most rugged part of Europe, as it is certainly the least known. The country which lies between the great range and the Danube, east of 24°, is only mountainous near the foot of the range, for its offsets rapidly decrease in height, and subside as they approach the river, on the banks of which the country exhibits merely an undulating surface.

From the southern side of the Balkan three ranges branch off: the eastern, which leaves the principal range about 70 or 80 miles from the Black Sea, is called Strandja or Stanches Dagh, and runs south-east, parallel to the Black Sea, but gradually approaching it. About 50 miles west of Constantinople, it turns to the south, and terminates at the mouth of the river Maritza. The latter portion is called Tekir Dagh. Both parts are of moderate elevation. The second range branches off from the Balkan east of 24° E. long., and runs first south-east till it approaches the Ægean Sea, within 20 or 30 miles, when it turns east and terminates nearly opposite the Tekir Dagh, on the banks of the Maritza. This chain, called Dispoto-Dagh, rises to a considerable elevation, though none of its summits seem to attain the snow-line.

The country between the Strandja Mountains, the Dispoto Dagh, and the Balkan is only mountainous towards the two last-named ranges; the greater portion of it rises only into hills, separated from one another by wide valleys, which in several places spread out into plains of moderate extent. This country possesses great fertility, and is one of the finest parts of Europe.

The third and most considerable range, which branches off from the Balkan on its southern side, since no modern name has been assigned to it, may be called by the antient denomination of Pindus. It leaves the principal range near 22° E. long., and runs south, forming the watershed between the rivers which fall into the Adriatic and those which empty themselves into the Ægean Sea. It may be considered as terminating south of 39° N. lat. with Mount Veluchi (7657 feet high). The length of this chain is upwards of 200 miles; and the greatest part of the upper range is for eight or nine months, and some summits probably the whole year round, covered with snow.

The country between this range and the Adriatic is very mountainous: it generally consists of high ranges and deep and narrow valleys, though in some places there are elevated plains of moderate extent, as that on which the town of Joannina (or Yanina) is built, which probably is at least 1500 feet above the sea.

The countries to the east of the Pindus range are less mountainous. That portion which extends north of 40° N. lat. contains high summits and ridges near the great range; but as it approaches the sea the mountains subside into hills, and the valleys widen by degrees into plains. Mount Athos, or Hagion Oros, is an isolated mass which terminates the most eastern of three projecting tongues of land, and rises to the height of 6349 feet.

Near 40° N. lat. a lateral chain branches off from the Pindus range. It is called Volutza Dagh and runs east, terminating near the sea in Mount Olympus, which attains the height of 6520 feet. Near 39° N. lat., between Mount Itamo (5789 feet high) and Mount Veluchi (7657), two lateral chains branch off to the east and terminate respectively on each side of the Gulf of Zeitoun. In the northern range, called by the Greeks that of Othrys, the Ieracovouni rises to the height of 5670 feet. In the southern range, known among the antients by the name of Oeta, the Katavothron rises to 7070 feet. Between the Othrys, the northern of these two ranges, and the Volutza Dagh is the plain of Thessaly, celebrated from the most remote antiquity for its beauty and fertility. Though it extends nearly 60 miles from north to south it is much narrowed by hills, which advance from the neighbouring ranges 15 or 20 miles into the plain, and on the sea side it is shut in by a barrier of mountains.

The country south of the Oeta range and the Gulf of Arta is mountainous in its western districts, but farther east it assumes a more undulating surface, though some of its numerous elevations rise to the height of mountains, as Mount Parnassus, which is supposed to rise to 6000 feet, and several others are perhaps not much lower.

Round the lake of Topolias, the antient Copais, there is an extensive plain, whose surface is several hundred feet above the sea level and walled in on the east by the high mountains which line the western margin of the Euripus. Some of these mountains are above 2000 and others above 3000 feet high.

The peninsula of the Morea is united to the continent by a rocky isthmus which in one part contains a considerable depression, across which several attempts were made in antient times to cut a canal. The Morea preserves the character of the countries which are dependent on the Balkan, being very mountainous, especially in its eastern parts, where several lofty ranges run in a south-eastern or southern direction. Mount Zyria, the Cyllene of the Greeks, seems to be the knot where the ranges unite. Cyllene is 7744 feet high, but the Pentedaktylon (Taygetus), in the southern part of the peninsula, rises to 7920 feet. The central districts of the peninsula contain some elevated plains which are probably as high as the interior of Spain. Tripolitza is 2224 feet above the sea, and Madrid, according to Bauza, is 2222 feet above the same level. In the western dis-districts the mountains gradually subside into hills; and several plains of moderate extent occur along the bay of Koron and the banks of the Alpheius.

The mountains of the island of Eubœa, which lies parallel to the coasts of Attica and Eubœa, belong to the mountain system of Othrys and of Oeta, from which it is separated on the north and west by those prodigious fissures which form the sea-valleys or channels of Trikiri and the Euripus.

The Great Plain.—Beginning at its western extremity, we find that between the mouths of the Schelde and the Elbe, the country hardly in any place rises to more than 100 feet above the sea. Its surface is covered with a succession of moors and heaths, ill adapted for agriculture, except in the alluvial tracts along the rivers. But this sterile country is surrounded by fertile marshes, which run along the shores of the North Sea, and are so low that it is

necessary to defend them by dykes from the invasion of the waves. The width of these marshes varies from one to four or five miles, except at the western extremity, where they occupy the whole of the province of Holland. Towards the banks of the Elbe the soil mostly consists of sand, but it begins here to be covered with forests.

The countries between the Elbe and the Vistula are more fertile, though the sandy soil prevails, especially towards the north; yet even here extensive tracts of fertile land occur. Towards the mountain region which borders on it on the south, especially in Silesia and the southern districts of Poland, the country may be considered as rather fertile. No marshes occur along the Baltic, but at the south-western extremity of this sea a series of small lakes begin which run parallel to the shore and follow its sinuosities. Their distance from the sea is about 50 miles, and they are situated on the highest part of the plain, perhaps at a mean elevation of 150 feet. They form the watershed between the small rivers which fall into the Baltic and those which run southwards into the interior of the plain.

That portion of the plain which we have so far noticed is drained by rivers which originate in the mountain-region south of it and traverse it in a north-western or northern direction. But east of the upper branches of the Vistula, the rivers originate in the plain itself which they drain. These rivers run either north-west and north to the Baltic and White Seas, or south and south-east to the Black and Caspian Seas. The watershed which separates their sources begins about 23° E. long. on the northern declivity of the Carpathian Mountains, in a range of hills which separate the Saan, a branch of the Vistula, from the sources of the Dniester. This range of hills runs in a north-eastern direction to the sources of the Bug, another tributary of the Vistula, where it turns north, and is lost in the plain. It is soon replaced by an immense swamp, the largest in all Europe. The principal body of this swamp covers nearly the whole basin of the river Priepec, which extends about 200 miles east and west, with an average breadth of 100 miles. It also continues northward, but with a much diminished width, between the sources of the Niemen, Beresina, and Vilia, and terminates on the banks of the Düna, south of Dünaburg and Polotz. The surface covered by this swamp is perhaps not inferior to that of England. Some parts of it are wooded. We do not know what is the elevation of this swamp above the level of the sea, but we may conjecture that it is not less than 300 feet. Towards the northern extremity of the swamp the watershed turns due east, and is here formed by an undulating country which separates the upper courses of the rivers Düna and Dnieper. But where it approaches the sources of the Volga it turns first north-east and then north, and here it is overtopped by steep and rocky hills, called the Hills of Waldai, which rise highest in the neighbourhood of that town, where they attain an elevation of 1200 or 1300 feet above the sea. This seems to be the highest point of the watershed. It continues in a northern direction till it passes 60° N. lat. between the lakes of Onega and Bielo Osero, and then turns south-east to the sources of the Suchona, the principal branch of the Dwina: thence it proceeds in an east-north-east direction to the sources of the Petshora, which falls into the Arctic Sea, and of the Kama, a branch of the Volga, where it terminates in the Uralian range. That portion of the watershed which is east of the hills of Waldai is covered with an immense forest, called the Forest of Volkhonsky.

The country north of the watershed is, in general, of moderate fertility; there are some districts which are covered with sand, while others have a rich soil. That series of small but very numerous lakes which we noticed in the western part of the plain continues in this at nearly the same distance from the Baltic, forming likewise a subordinate watershed. East of 22° E. long. however it stretches farther inland, approaching the northern extremity of the great swamp, and then continues north of it along the watershed to the hills of Waldai, [illegible] still farther in the Forest of Volkhonsky, where it terminates near 35° E. long.

The country north of 60° N. lat. is only in a few places fit for agriculture, partly on account of its cold climate, and partly on account of the sterility of the soil. That portion which lies west of the lake of Onega is rocky, and is mostly traversed by ridges of rocky hills, which lie in a north and south direction. These hills rise in some places to 500 or 600 feet above the sea. Most of them, as well as the level country between them, affords excellent pasture ground. This region is remarkable for its numerous large lakes, which cover nearly one-fourth of its surface, and are connected by short natural channels. The largest of these lakes are the Ladoga, Onega, Saïma, and Enara.

There are only a few lakes east of the lake of Onega. It appears that the watershed here rises to a greater elevation, and that the slope of the country is more regular. Its southern districts are still covered with forests, and a few spots are cultivated; but its northern districts extend in immense plains, covered with moss, which by attracting the water of the melting snow renders them impassable for the greatest part of the summer. A few rocky ranges of hills occur on this plain, but we are not acquainted with their direction and elevation.

By far the greater part of the Great Plain extends to the south of the watershed. Contiguous to its southern declivity extends a country of great fertility, from 300 to 400 miles in width. It begins on the west near the foot of the Carpathian Mountains, and terminates on the east where the Volga begins to run south-south-west. The parallel of 49° forms its southern boundary, as far east as about 40° E. long., whence it runs in a north-eastern line to the town of Simbirsk on the Volga. The town of Moskwa, situated nearly in its centre, is 480 feet above the sea. The country east of the Volga, as far as the Uralian range, is mostly covered with hills, and is even mountainous, being traversed by the offsets of the great range: it is of moderate fertility in the valleys, which are frequently wide. The hills and lower parts of the mountains are covered with forests.

To the south of this region extend the deserts which are called the Steppes. They may be divided into the Higher and Lower Steppes, the line of separation between them being the high ground which extends north and south between the Don and Volga. The Higher Steppes occupy the western part of the plain, extending south of the fertile region to the very shores of the Black Sea. Their elevation above the sea may be between 150 and 200 feet. They are without trees, produce only in some places a few shrubs, and are overgrown in the early part of the summer with a coarse grass, which affords very indifferent pasture. In the latter part of the summer and autumn their dry brown surface shows no sign of vegetation. Agriculture can only be carried on in the narrow bottoms along the rivers. The peninsula of the Crimea is connected with them by a low isthmus. Three-fourths of its surface resemble the Lower Steppes; but on its southern shores rises a mountain-range, whose highest summit, the Chatyr Dagh, is 5040 feet. The valleys of this range are fertile.

The Lower Steppes are at the eastern extremity of Europe, extending between the southern extremity of the Uralian range and Mount Caucasus along the banks of the river Ural, and on both sides of the lower course of the Volga. They occupy a space more than twice as large as the area of the British Islands. The southern part is lower than the level of the sea, the Caspian Sea being more than 300 feet beneath it, and the adjacent country rising very little above its shores. The town of Saratow on the Volga, more than 300 miles from the Caspian, is not above the sea-level. We do not know how much higher the northern districts of these steppes rise, nor if their soil differs from that of the southern, which are covered with a fine sand, intermixed with shells, producing no trees nor shrubs, but at certain seasons a scanty grass. This soil is strongly impregnated with saline matter, and most of the lakes which occur here contain such a quantity of salt that it crystallizes in summer, and supplies the greatest part of the inhabitants of Russia. In no part of these steppes are any traces of agriculture visible except in the neighbourhood of Astrakhan.

We shall conclude this general survey of Europe by observing, that the Uralian range, which runs about 1500 miles, first south and then south-south-east, rises in its highest summit, the Pawdinskoi Kamen, to more than 6800 feet above the sea; that the Lower Steppes extend east of the river Ural far into Asia; and that Mount Caucasus, though only few of its summits attain the snow-line, rises in its highest summit higher than the Alps, Mount Elboorz attaining an elevation of 16,800 feet.

Looking at the map of Europe we find that its coast-line is formed alternately by wide projecting promontories and deep bays, which divide them from one another. This peculiarity has led a large proportion of its inhabitants to a

sea-faring life, and as the winds and weather in the waters that surround this continent are not regulated by the seasons of the year, but are subject to continual changes, this circumstance has given to them that boldness in maritime enterprise which forms the most distinguishing feature in their character, and raises them above most other civilized nations of the globe.

Europe, in fact, considered by itself, is only a large peninsula, which is further cut up into a great number of smaller peninsulas by the interior seas and gulfs which penetrate far inland into the main mass of the peninsula; consequently, in proportion to its surface, it presents a much greater extent of coast than any other of the great divisions of the globe, as will appear by the annexed table, which however must be considered only as a rough approximation:—

	Surface in square miles.	Coast-line. Miles.	Ratio of one mile of coast-line to area in square miles.
Asia	18,000,000	35,000; or including the islands, 40,000.	500; or including the islands, 420.
Africa	14,000,000	16,000	900
Europe	3,900,000	20,000	195
America	15,000,000	32,000 (without the coast of the Arctic Sea).	470

The Atlantic Ocean, with which all the seas that wash the shores of Europe are connected, except the Caspian (and this is rather to be considered as an immense inland lake), forms the Bay of Biscay between Cape Finisterre and the island of Ushant; the English Channel between the northern coasts of France and the southern coasts of England; St. George's Channel, between Great Britain and Ireland; and the North Sea, which separates Great Britain from the Netherlands, Germany, Denmark, and Norway. The North Sea might be considered a closed sea, as it is united on the south to the great expanse of the Atlantic only by the straits of Dover, which, between the South Foreland in Kent and Cape Grisnez in France, is only eighteen miles wide, and by the comparatively narrow channel called the English Channel, if it were not on the north connected with the Atlantic by the open and wide expanse of sea which separates North Britain from Norway.

The close seas, which are united to the Atlantic by straits, are the White Sea, the Baltic, and the Mediterranean; with the latter the Black Sea and the Sea of Azof are connected.

The White Sea, the smallest of these inland seas, covers an area of only about 40,000 square miles. The strait by which it is connected with that portion of the Atlantic which is called the Arctic or Icy Sea, is about 200 miles long, and of considerable width, its narrowest part being from 30 to 40 miles across. This sea is entirely or partially covered with ice during four or five months of the year. Into its eastern part the Dwina falls; and into the wider part of the strait the river Mezen.

The Baltic is connected with the North Sea by a channel with about 80 or 90 miles of average width; this channel branches off from the North Sea in an east-north-east direction, but afterwards suddenly turns south. That portion which is connected with the North Sea and extends to the east-north-east is called Skagerack, or the Sleeve by the British sailors, and the other part, which lies south and north, the Cattegat. At the southern extremity of the Cattegat are the three straits by which the Baltic is entered like three gates. The Sound, between Zeeland and Sweden, is the passage generally taken by vessels; it is at the narrowest place only about two miles wide. The Great Belt is in the middle between Zeeland and Fünen, and eight miles across at the narrowest place. The Little Belt, which is only three-quarters of a mile wide where narrowest, separates the island of Fünen from the peninsula of Jutland. The Baltic forms three great gulfs—those of Riga, Finland, and Bothnia. Receiving, by the numerous rivers which fall into it, great masses of fresh water, it is less salt than the Atlantic. This circumstance, and the small depth of its waters, sufficiently explain why ice is formed nearly every year along its shores, and the navigation is interrupted for three or four months.

The Mediterranean is connected with the Atlantic by the strait of Gibraltar, which is about ten miles across. It is the largest of the close seas which wash the shores of Europe, but it receives the drainage of a comparatively small portion of its surface; the number of rivers which fall into it is very considerable, but few of them run 100 miles. Evaporation carries off a larger portion of its waters than is supplied by the rivers which flow into it, and there is accordingly a strong current setting continually through the straits of Gibraltar. A motion of its waters towards the east is proved by vessels requiring a greater time to sail from the coast of Syria to Gibraltar than from Gibraltar to Scanderoon. Its waters are salter than those of the Atlantic. It also forms several large gulfs; as, on the European side, the Bay of Lyon, that of Genoa, the Adriatic, and the Ægean Sea, or Archipelago. By means of this sea the Straits of the Dardanelles (one mile across where narrowest), the Sea of Marmara, and the channel of Constantinople (six furlongs across at the most narrow place), the Mediterranean is united to the Black Sea, from which a constant current pours through the narrow straits into the Ægean. [Eubœa.] The Black Sea is connected by the strait of Yenikale with the Sea of Azof. It is less salt than the Mediterranean, and its northern shores in winter are frequently fringed with ice.

The Caspian Sea, whose north-western shores only are included in Europe, is the largest of the numerous seas without an outlet which occur in the north-western regions of Asia. Ice is formed every winter along its northern shores. Its waters are salt, but only in a slight degree.

Seas.	Extent. sq. miles	Specific gravity of its waters.
Mediterranean	760,000	1.0293
Black Sea and Sea of Azof	190,000	1.0142
Caspian	180,000	
Baltic	160,000	1.0400
White Sea	40,000	1.0190
Atlantic Sea, in the northern hemisphere		1.0283

When we consider these seas as the receptacles of the drainage of the adjacent countries, we find that those towards the east have the most extensive basins. The basin of the Caspian Sea, though it is only drained by two large rivers, the Volga and the Ural, occupies a surface of 850,000 square miles, as far as it belongs to Europe, and runs with its northern boundary along the parallel of 60° N. lat. The basin of the Volga, the largest of the rivers of Europe, contains an area of above 750,000 square miles. The basin of the Black Sea is somewhat larger. Its south-western boundary is formed by the principal range of the Alps; its north-western by a line drawn from Switzerland to Moscow; and another line from this city to the mouth of the Volga, forms its north-eastern border. Its area in Europe is rather more than 900,000 square miles. The countries which are comprehended in the European part of its basin are drained by the Danube, Dnieper, Dniester, Don, and Kuban, and their tributaries. The basin of the Baltic is nearly equal in extent, including the Cattegat and Skagerack, being on all sides surrounded by countries which belong to Europe; their basin extends over a surface of nearly 900,000 miles, though perhaps none of its rivers rise more than 350 miles from its mouth in a straight line. The great rivers which fall into the Baltic are the Oder, Vistula, Niémen, Düna, Newa, and the numerous rivers descending from the Scandinavian range, as the Tornea-elf, Calix-elf, Lulea-elf, Pitea-elf, Scaleftea-elf, Umea-elf, Angerman-elf, Indals-elf, Liunga-elf, Ljusna-elf, and Dal-elf; and likewise the Götha-elf, and Glommen, which fall into the Cattegat and Skagerack. The basin of the White Sea is drained by the Dwina, the Mezen, and Petshora, and some other smaller rivers, and occupies a surface of about 400,000 square miles. Though the coast-line of the Atlantic from Cape North Kyn to Cape Tarifa, comprehends the whole of the shores of the western declivity of Europe, including the British islands, its basin probably does not much exceed 600,000 square miles. No considerable river flows into the Atlantic between Cape North Kyn and the mouth of the Elbe. Into the North Sea there flow the Elbe, Ems, the Rhine, Schelde, and of the rivers of Great Britain, the Spey, Tay, Forth, Humber, and Thames; into the English Channel, only the Seine; into St. George's Channel, the Severn; into the Bay of Biscay the Loire and Garonne; and immediately into the Atlantic the Clyde, the Shannon, the Duero, Tajo, Guadiana, and Guadalquivir. The basin of the Mediterranean, including the Archipelago, is by far the

smallest of all those which belong to the inland seas of Europe, comprehending only about 250,000 square miles. The largest of its rivers, the Rhone, flows only 500 miles, including its bends. The other rivers, which are of a considerable length, are the Ebro in Spain; the Po and Tiber in Italy, and the rivers of Albania and the Maritza in Turkey. All the rivers which drain the basins of the Mediterranean and Atlantic Sea rise in the South European mountain region; those which fall into the Black Sea rise within the Great Plain except the Danube and its tributaries, which drain about one-third of the mountain region. The rivers which run to the Caspian rise partly on the watershed of the Great Plain, and partly in the Uralian range; and the same is the case with those that drain the basin of the White Sea. The rivers which flow from the east into the Baltic rise on the Great Plain; those which flow into it from the south rise on the edge of the mountain region; and those which fall into it from the north descend from the Scandinavian range.

Climate.—The climate of Europe presents great differences, if we compare it with that of those countries in other divisions of the globe, which lie within the same parallels. It is a well-established fact, that the eastern coast of North America is much colder than the western coast of Europe, under the same latitudes. This difference is in some places equal to 10° of latitude. Thus we find that the mean annual heat of London (51° 31′ N. lat.) is nearly 50° Fahr., while at Quebec (46° 48′ N. lat.) it hardly exceeds 42° Fahr. At Lisbon (38° 43′ N. lat.) it is 61½° Fahr., and at Williamsburg in Virginia (37° 5′ N. lat.) only 56° Fahr. It is however worthy of remark, that the eastern countries of Europe, especially those north of the Black Sea, are much colder, and approach in climate those of the eastern coast of America. At Moscow (55° 47′ N. lat.) the mean annual heat is not quite 38° Fahr., whilst at Edinburgh (55° 58′ N. lat.) it exceeds 47° Fahr.

This difference in the climate of Europe may perhaps be explained by the circumstance that this continent is enclosed on most sides by seas whose water is warmer than that of the ocean at large. The water of the Mediterranean is from 4° to 5° Fahr. warmer than the ocean without the straits. Between America and Europe the warm water of the gulf stream, which exceeds the heat of the other water of the Atlantic by 8° or 10° Fahr., covers a surface not inferior to that of the Mediterranean, and the exhalations of this immense expanse of warm water are carried by the prevailing western and south-western winds to the western shores of Europe. Besides this, the water in the sea between Spitzbergen, Greenland, and the coast of Norway indicates a higher degree of temperature when drawn from some depth under the surface of the sea than on the surface itself. This has been proved by the experiments of Sir John Franklin and Captain Scoresby, though the contrary is the case in all other seas, as far as we know.

Dr. Brewster however thinks that there are two frigid poles in the northern hemisphere, and that the degree of warmth increases with the distance from the meridian in which these poles are situated. By comparing the few exact meteorological observations which have been made in remote countries, he is induced to infer that these meridians are about 90° from the western countries of Europe, and hence he presumes we may account for the greater mildness of the climate in these regions. The observations which the latest traveller through the north of Asia, Dr. Erman, has made in those remote countries, seem rather to confirm than to contradict the theory of Dr. Brewster.

With respect to climate, Europe may be divided into three zones, the northern, the central, and the southern. These zones may be separated from one another by two lines, of which the northern begins near 60° N. lat., on the western coast, and terminates between 55° and 54° N. lat. on the Uralian range on the east; the southern commences about 48° N. lat. on the west, and terminates on the east at the mouth of the Danube (45° N. lat.). In the northern zone only two seasons occur, summer and winter, the former lasting about three months (June, July, and August), and the latter nearly nine months. These seasons are separated by a spring and autumn of a few days, rarely two weeks' duration. In summer the heat is very great, and the vegetation inconceivably rapid. The winter is severe and boisterous, and brings down immense quantities of snow. In the central zone the four seasons are distinct, and the passage from heat to cold and *vice versâ* is very gradual. The heat is less than in the northern zone, and so is the cold during the winter; still frost prevails during two, three, or four months, and snow is common except on the coasts. In the southern zone frost is either not felt at all or only during a few days; and snow is of rare occurrence, or it does not lie on the ground for more than a few days. Vegetation accordingly is very little interrupted. But the countries within this zone have abundant rains during the last three months of the year, and are subject to great and long droughts in summer. These droughts frequently continue for four or five months, and in some places occasionally for eight or nine months.

IV. *The Man of Europe.*—Nearly the whole population of Europe belongs to that race which is comprehended under the name of the *Caucasian* race; but along the Uralian range, and at the most northern extremity of the continent, a few nations occur which belong to the Mongolian race; to which must be added the Magyars, who inhabit nearly the centre of Europe (Hungary).

The inhabitants of the Caucasian race may be divided into three great branches and several smaller ones, if we consider them with reference to their language. The first division comprehends those languages which are derived from the Latin and an admixture of the languages of the antient aborigines and of the later destroyers of the Roman empire. These languages are spoken in the peninsulas of Italy and Spain and in the countries west of the valley of the Rhine. They are the Italian, Spanish, Portuguese, and French languages. In some districts of the countries where these languages are spoken there still exist the languages of some of the aboriginal inhabitants of Europe. On both sides of the western extremity of the Pyrenean mountains, south and west of the river Adour, the Basque language is spoken by a population not exceeding 600,000 souls, according to the most exact computation. The Cymric language is spoken in Wales, and also in the interior districts of the most north-western peninsula of France, which is called Bretagne (Little Britain), by a population amounting to about 2,000,000 individuals. The most extensive of these languages is the Celto-Gaelic language, which is still prevalent in the greater part of Ireland, and in some of the northern districts of Scotland. The number of the individuals who speak it perhaps does not fall short of 7,000,000. Many persons think that the Cymric and Celto-Gaelic languages ought to be considered only as dialects of the same original language.

The second great branch of the languages is formed by those of Teutonic origin. These languages are spoken by the inhabitants of England, a great part of Scotland and Ireland, Iceland, Norway, Sweden, Denmark, Germany, and the Netherlands. In every one of these countries a pecular dialect is spoken, though the affinity of all these languages cannot be questioned. It would seem as if these languages had been introduced into these countries by their first inhabitants, or aborigines, as at present no other language is spoken in any of these districts (with the exception of the British islands), nor do we find any mention in historical records of such other languages ever having existed.

The third great family of languages is comprehended under the name of Slavonian. The most western tribes that speak these languages are found in the eastern districts of Germany. The Czekes inhabit Bohemia, and the Wendes the north-western part of the Prussian province of Silesia. In the south-western part of the same province Polish is spoken. Between Vienna and Trieste is another Slavonian tribe, also called Wendes, or Windes by the Germans; but they call themselves Slovenzi. Towards the south the Slavonian language extends to the very summit of the Balkan, the inhabitants of Dalmatia, Croatia, Slavonia, Bosnia, Servia, and Bulgaria, speaking dialects of that language. From these extreme points the Slavonian language is spoken over the whole of the great plain of Europe to the borders of Asia, on the Uralian range, and on the river Ural. The most extensively spoken languages of this family are the Russian and the Polish.

In the immense tract of country in which the Slavonian language may be considered as prevalent, some extensive districts are occupied by nations who speak different languages. We shall first notice the tribes of Mongolian origin, who form three different groups. The most numerous tribe are the Magyars, who inhabit the greatest part of the Hungarian plain, especially that portion which lies east of the Danube, from the banks of which river they extend to the foot of the Carpathian mountains, where they

are on every side surrounded by Slavonian tribes. The second group of nations of Mongolic origin occupy the countries between the Scandinavian Peninsula on one side, and the White Sea and the three great lakes of Ladoga, Onega, and Peipus on the other side. The Laplanders inhabit the country between the northern extremity of the Gulf of Bothnia and the White Sea; the Finns occupy the country farther south, as far as the Gulf of Finland. At the most eastern part of this gulf live the Inghers, and south of it the Esthonians and the Livonians, who extend to the southern part of the Gulf of Riga. All these nations speak dialects of the same language, which is said to have a great resemblance to the language of the Magyars. The third group of the Mongolian tribes occupy the countries along the Uralian range, and between the rivers Ural and Volga. The most northern tribe are the Samoyedes, who occupy the eastern portion of the government of Archangel, between the river Metzen and the Uralian range. South of them, in the eastern districts of the government of Wologda, are the Siryanes, who also occupy the northern part of the government of Perm. In the southern districts of this government are the Permiens, the Wogules, and Wotyakes. Here are also a few families of the Mordwines, Cheremisses, and Chuwashes, who are dispersed over the surface of the governments of Viatka, Kasan, Simbirsk, and Pensa, where they inhabit an extensive district on the western side of the Volga. Their neighbours on the other side of the Volga are the nomadic tribes of the Calmucks and Kirghises. The former occupy the countries contiguous to the Volga, on its eastern bank; but the Kirghises inhabit those between the rivers Useon and the river Ural. The two latter tribes are Bhuddists. To these tribes are still to be added the Bashkirs, who, in their stature, and the conformation of their face, evidently show their Mongolian origin, though they speak a Turkish dialect. They inhabit the most eastern part of Europe, the northern portion of the government of Orenburg, and some districts of that of Perm, on both sides of the Uralian range.

Different both from the Mongolian languages, and those of the Slavonian tribes, are the languages spoken by the Lithuanians and Courlanders, two small nations who inhabit the countries between the rivers Niemen and Düna, and extend over the northern districts of eastern Prussia and the Russian governments of Grodno, Minsk, Wilna, and Mitau.

The Wlaches, or inhabitants of Wallachia and Moldavia, speak a peculiar language, with which a great number of Latin words are mixed up. Hence it is inferred that their ancestors inhabited these countries when they were subject to the Roman empire.

The eastern peninsula of southern Europe is inhabited by nations who speak three different languages. The most numerous are those who speak the Turkish language, which is used by the Osmanlis or Turks, and the Tartars. Some tribes of the latter nation are also dispersed among the Slavonian nations, on the northern shores of the Black Sea, where they are known by the names of the Nogai Tartars and Meshtcheryakes. They are most numerous in the Crimea, and along the northern declivity of the Caucasus. The Osmanlis form the bulk of the population in those parts of Turkey which lie between the Balkan and the Volutza range. The mountainous countries west of the Pindus range are inhabited by the Albanians, who speak a peculiar language, and are considered as the descendants of the Illyrians, the aborigines of these countries. The most southern part of the peninsula is inhabited by the Greeks, who form the bulk of the population in Greece, and also in that portion of Turkey which lies between the Volutza and Othrys ranges. Their language does not differ substantially from the antient Greek, of which it is a corrupted form, mixed up with some Latin, Italian, Turkish, and other foreign words.

The population of Europe is calculated to amount to about 230 millions in round numbers. The Christian religion is that which generally prevails. The Catholic faith is nearly exclusively professed by the inhabitants of Portugal, Spain, and Italy, and also by the majority in France, Austria, Bavaria, Poland, Belgium, and Ireland. Catholics are also numerous in some cantons of Switzerland, and some provinces of Prussia and of Russia. The whole number of the adherents of this faith is calculated to amount to 112 millions. To the Greek church belong the Russians and the Greeks; and a great number of the members of this church are dispersed over different parts of Turkey: they amount altogether to about 54 millions. The inhabitants of Sweden, Norway, and Denmark are nearly exclusively Protestants; and the various sects of Protestants form the great majority in England, Scotland, Holland, Switzerland, Prussia, and the northern and western states of Germany. In France, Austria, Ireland, Belgium, and some provinces of Russia, Protestants are numerous. The whole number is about 52 millions. There are Armenians in Russia, Austria, and Turkey; about 200,000 in all.

The Turks and Tartars, with some of the small tribes of Mongol origin along the Uralian Mountains, are Mohammedans. Their number is supposed not to fall much short of six millions. Among the Laplanders and Samoyedes there are still some who have not embraced Christianity. The Calmucks and the Kirghises are mostly Bhuddists. At Astrakhan there are a few Hindoos. The Jews are most numerous in some parts of Russia, Poland, Austria, and Turkey. Their number cannot be accurately estimated. In the south-eastern countries of Europe there is a considerable number of gypsies: it is doubtful what their religion is.

The following is a tabular view of the sovereign states of Europe in 1837. The areas and population are given from the latest and best authorities, and, wherever they could be got, from official documents. It is hardly necessary to observe that these figures must be considered only as approximations with respect to several of the states of Europe, such as Turkey and Greece, for instance.

Those thus marked * are states which are members of the Confederation of Germany.

States.	Form of Government.	Area. Sq. miles.	Population.
Andorra (Pyrenees)	Republic, with two syndics and a council	190	15,300
*Anhalt-Bernburg	Duchies, with states having limited powers	336	45,500
*——— Cothen		310	36,400
*——— Dessau		357	57,600
*Austria, Empire of 1, in Germany, Hungary, &c.;	Absolute monarchy, with the exception of Hungary and Transylvania, which have legislatures	237,334	29,600,000
2, in Italy		17,892	4,500,000
*Baden	Grand duchy; limited sovereignty, with legislature of two chambers	5,712	1,240,000
*Bavaria	Limited monarchy; two chambers	28,435	4,300,000
Belgium	Do.	12,569	4,230,000
*Bremen	Republic; senate and convention	67	57,800
Britain, Great, Ireland, and settlements and islands in Europe	King and two houses of parliament	116,700	25,300,000
*Brunswick	Duchy; limited sovereignty, with one chamber	1,525	250,000
Church, States of the, or Papal States	Absolute and elective sovereignty	17,048	2,590,000
Cracow	Republic; senate and chamber of representatives	490	124,300
Denmark, Continental	Absolute monarchy, with provincial states having limited powers	21,472	2,040,000
——— Islands		38,290	57,400
France	Limited monarchy; two chambers	202,125	33,600,000
Frankfort (on the Main)	Republic; senate and legislative body	91	56,000
Greece	Absolute monarchy	10,206	810,000 (a)
*Hamburg	Republic; senate and common council	149	153,000
*Hanover	Limited monarchy; two chambers	14,600	1,679,000
*Hesse-Cassel, or Electorate of Hesse	Limited sovereignty; one chamber	4,386	699,000
*Hesse-Darmstadt, or Grand Duchy of Hesse	Do. two chambers	3,198	765,000
*Hesse-Homburg	Landgraviate; absolute sovereignty	154	24,000
*Hohenzollern-Hechingen	Principality; limited sovereignty, with one chamber	136	21,000
*——— Sigmaringen	Do. do.	383	42,800
Holland (including Duchy of Luxemburg)	Limited monarchy, with two chambers	13,890	2,820,000

(a) The area is assumed from the President's decree of the 25th of April, 1828. Balbi and others carry it above 15,000. The population, according to Klade's Almanac for 1837, is 926,000, besides 12,326 troops.

States.	Form of Government.	Area. Sq. miles.	Population.
Ionian Islands	Free state; with council and one chamber, under British protection	998	242,000
*Liechtenstein	Principality; limited with one chamber	52	5,800
*Lippe-Detmold	Do. do.	452	79,000

Zoology of Europe.—In giving a general view of the animals of Europe, it will be found that the number of wild quadrupeds at present existing (many species having become extinct from the progress of civilization), is too small to exhibit many characteristic peculiarities in their geographical distribution and local adaptation; and the close connexion of this continent with that of Asia makes it very difficult to draw any exact line between their productions. Many of the animals of the south of Europe are also common to the north of Africa; and most of the quadrupeds inhabiting the northern parts of our continent are found in the corresponding latitudes of Asia and America. But though the zoology of Europe does not possess much interest from the number, size, or peculiarity of its animals, this is in some measure compensated by the intimate acquaintance which we possess with the habits and manners of many of the smaller species, whose natural history has been carefully investigated by many able and industrious naturalists.

In the following table the mammalia which are found in Europe are arranged according to their position in the orders of the Cuvierian system; those which are peculiar to this continent, and those which are common both to it and other parts of the globe, are placed in separate columns.

ORDERS.	Whole No. of known species.	Whole No. of European species.	No. of species peculiar to Europe.	No. of species common to Europe and other Continents.
I. Quadrumana	186	1	0	1
II. Cheiroptera	192	27	18	9
III. Carnivora	320	50	17	33
IV. Marsupialia	67	0	0	0
V. Rodentia	295	35	12	23
VI. Edentata	23	0	0	0
VII. Pachydermata	30	1	0	1
VIII. Ruminantia	157	8	1	7
IX. Cetacea	76	28	10	18
Total	1343	150	58	92

We here see the relative number of European mammals placed according to their organization, in different groups or orders; and we may remark that no animal is found in Europe belonging to the Marsupialia and Edentata, while of the Quadrumana and Pachydermata two species only inhabit our continent, one belonging to each order, the Barbary ape (Inuus sylvanus) and the wild boar (Sus scrofa). The former is found among the precipices of the rock of Gibraltar, and thus enters into the geographical limits of Europe.

The domesticated quadrupeds occupy a much more important station among the animals of our continent than any of the wild species: under this head we shall mention the horse, ass, goat, sheep, ox, hog, dog, and cat, and in the more northern parts of Europe the rein-deer may be added.

No wild races of horses at present exist which have not descended from domesticated varieties; but it seems probable that they were aboriginal in Tartary, and most likely in other parts of Asia. From the former country it is conjectured that they were originally imported into the north and east of Europe; while in the southern and western parts of the continent they were probably derived from Barbary and Arabia; but this of course must be mere conjecture, as we cannot name any time within historical limits when these animals were not spread over all or the greater part of Europe. The horses of Spain were celebrated in the time of the Romans, after which they were probably crossed with the Barbary and Arab breeds during the Moorish dynasty. They may be considered as the lightest and fleetest of the old European breeds, and the nearest approaching to the Arab; but they have fallen off greatly during the last century, little care having been bestowed in keeping up the more noble breed. The best Spanish horses are generally about four feet six or eight inches high, and closely resemble the beautiful Arabians of Barbary called Barbs: those of Andalusia, Granada, and Estremadura are the best. The heaviest horses in Europe come from the shores of the North Sea, and the smallest from the north of Sweden and from Corsica. Those of Germany and Italy are of little note. Switzerland produces good draught horses, and those of Holland are noted for the same qualities. The French is a useful and hardy race, and will endure greater fatigue, though it is not possessed of the size and beauty which now characterize the English horses: the native breeds have been much improved lately by crossing with English stallions. Greater attention is paid to the breeding of horses in England than in any other country except Arabia; but while the Arabs only endeavour to preserve their breed in its original purity, we have improved upon it by crossing with other varieties, till the English horses both exceed the Arabian in size and fleetness, and equal them in many instances in symmetry, though they are not quite their match in powers of endurance. The English horses have been divided into four principal classes—the racer, the hunter, the carriage-horse, and the dray-horse.

The ass in Europe holds a very inferior place to the horse.

(a) Including the governments of Perm, Viatka, Kasan, Simbirsk, [illegible], [illegible], Astrachan, and part of Orenburg, 158,390 square miles.
(b) According to the Appendix to a decree in the 'Madrid Gazette' of August, [illegible].

It is generally an ill-used and neglected animal. Originally of Asiatic extraction, it does not accommodate itself so well to our climate as the horse; for it feels the effects of cold more, and degenerates in northern countries; a circumstance which partly accounts for the contempt in which it is held. In the southern parts of Europe it is a fine spirited animal, and approaches in appearance and usefulness to those of Western Asia and Egypt. The Spanish and Maltese are the finest breeds of asses in Europe. One principal use of this animal is for the breeding of mules, which are extensively used in the mountainous parts of Southern Europe as beasts of burden, where, from their possessing the sureness of foot of the ass, with greater size and strength, they are found exceedingly useful.

Sheep and goats, though placed in distinct genera, are so nearly allied, that the characters which distinguish them are very slight; and there are several races or species of wild sheep and goats very nearly approximated.

It is not easy to trace the present domesticated varieties of either of them to any species still existing in a wild state, for both goats and sheep were among the earliest animals domesticated by man. Cuvier imagined that all the present varieties of the domestic goat have arisen from the Capra ægragos, a wild species inhabiting the mountains of Persia, where it is called Paseng by the natives. He also states that this animal has been found on the Alps; but it has been supposed that this variety, which is met with there in a wild state, might have been a hybrid between the common goat and the Ibex. It seems probable that the goat preceded the sheep in domestication; at any rate it did so in the north and west of Europe for many ages. It is a hardier animal, and will live on the roughest fare, being an inhabitant of mountainous districts, where it is principally bred. The most numerous and finest varieties of domestic goats are in Asia. The Welsh breed is large, with fine long hair, generally white. In Sweden and Spain there are long-haired hornless breeds, with upright ears. The utility of goat's milk is well known; and though the flesh of the adult animal is not much valued, that of the kid is very palatable; the horns and hair are used in different manufactures; and the skin is formed into leather for making gloves, &c.

Sheep seem to have been originally derived from western Asia, whence they were imported into Africa, where they arrived at greater perfection than in their parent country. All the wild varieties of sheep have hair, and not wool: the change in the covering of the body seems to have arisen from the effects of cultivation and climate. The different kinds of domestic sheep are all supposed to have arisen either from the Argali (Ovis ammon), or the different varieties of Musmon (O. musmon), one of which is still found wild in some of the islands of Europe, as Candia, Sardinia, and Corsica. There seems formerly to have been a wild race of sheep in Great Britain, which was very large, with great horns and tail. Mr. Pennant observes (*History of Quadrupeds*) that such an animal is figured on a bas-relief taken from the wall of Antoninus, near Glasgow. Boethius says that a breed of sheep lived in St. Kilda which had horns as large as an ox, and reaching to the ground. The principal European breeds of domestic sheep are—1, the many-horned of Iceland; 2, the Cretan; 3, Wallachian; 4, Merino, or Spanish: 5, the English, of which there are many varieties. The most important among the continental races is the Merino, which differs from the English in bearing wool on the forehead and cheeks. The wool is of the finest quality for manufacturing cloth. This breed is extended over the greater part of Spain. But Great Britain possesses the most valuable race of sheep, taking every thing into consideration; for it produces the greatest quantity of the best wool, and the most delicate flesh.

The ox, which belongs to the largest tribe of ruminating animals, is eminently serviceable to man, though since the horse has come into such general use, oxen have been less employed in husbandry. It was first domesticated by the Caucasian nations of western Asia, and from thence is supposed to have found its way into Africa and Europe; but it has been imagined that the domestic varieties in our continent might have arisen from races which once existed in Europe, and even in Britain, in a wild state, the only remains of which is the wild bull of Scotland (Bos Scoticus), still preserved in one or two parks in the North. This is most probably the species which was named Urus by Cæsar, and other antient writers; but what makes it improbable that this was the parent of our domestic oxen is the fact, that several important anatomical differences, principally as to the shape of the skull, are discovered between the Scotch bull and the domestic ox. Numerous specimens of fossil skulls, found in the more recent formations, which are supposed to have belonged to the antient Urus, present also the same differences. The largest European breeds of cattle are those of Podolia, and the Ukraine, of Turkey, Hungary, and the Roman states. The Roman variety is supposed to have been introduced by the Goths, as all the representations of oxen found among old sculptures seem to denote a smaller race, more resembling that which is now seen in Tuscany, of a fine form, and pure white colour. There is a large breed of oxen in Denmark, which is the origin of the Dutch and Holstein varieties; the latter is the parent of the English unimproved breeds.

The hog occupies a low place in the scale of domestic animals, though its flesh forms an exceedingly good article of diet, and one much used by the peasantry in Christian countries. One of its most valuable qualities is that of preserving exceedingly well with salt, without becoming dry and hard, and losing its nutritive properties. The common wild boar (Sus scrofa) of Europe is no doubt the original parent of our domestic varieties. It was once indigenous over the whole of the old world, though now exterminated from some countries, as for instance Great Britain. The English breed of pigs is the finest in Europe, and some of them are fattened to an enormous size. In Ireland every cottager keeps his pig as a regular part of his establishment; and the salting of pork for exportation is a considerable article of trade in that country. There is a peculiar long-legged race of swine in Portugal and Spain. The pigs of Poland and Russia are of a reddish colour, and very small.

The dog claims our attention, not for his use as a beast of burthen, or in providing food for our tables, but for the attachment which he shows to man, becoming his companion and friend, assisting him in his pleasures, and protecting his property and home.

M. F. Cuvier has divided the different varieties of dogs into three primary types; the first has the jaws and muzzle elongated, and we may remark that all the wild species, as the Dingo of New Holland, &c., belong to this group, and more resemble the wolf and fox: this therefore may be considered as the most natural type. The second group has the jaws shorter than in the first, though longer than in the last division. The principal varieties of dog found in Europe belonging to the first group are—1, the *Albanian*, mentioned by the oldest historians and poets; 2, the *French matin*, which is considered by the writers of that nation as the most important of the canine race, and the ancestor of many others; 3, the *Irish Greyhound*; 4, the *great Danish Dog*; 5, the *common Greyhound*. The second group of dogs includes the most intelligent and useful kinds, as the spaniels, hounds, shepherd's, and wolf dogs; and we may here mention as belonging to this section the Alpine spaniel, or Mount St. Bernard dog, a variety of the Spanish breed, which is a beautiful and intelligent animal, kept by the monks at the monastery, from whence it derives its name, for the preservation of unfortunate travellers, who are often lost in the snows of this inhospitable region. Two of them are said to be sent out together, one carrying a cloak, and the other a basket of provisions and cordials: thus provided, they often discover, and are the means of saving persons who would otherwise perish with cold and fatigue. In the last group, which have the muzzle very short, are placed the *mastiff*, *bull-dog*, *pug*, &c. Our English breeds of mastiffs were once so celebrated that the Roman emperors appointed an officer in the island, whose business it was to send these dogs to Rome to fight in the arena; and in later times, when in our own country savage conflicts between dogs and wild beasts were a fashionable amusement, great care was bestowed on the breeding of bull-dogs and mastiffs.

There has been considerable diversity of opinion respecting the origin of the domestic cat, and the part of the world from whence it originally came. It has been thought by some that it must have been an inhabitant of warm climates, as it is a chilly animal, and always creeps as near to the fire as possible. Cuvier believed that it was a native of our European forests, and was the same species as the wild cat at present found, having been only altered by the effects of domestication. In support of this opinion, it is

asserted that cats in some places, near woods or forests, will stray away and return to a savage state, when they assume very much the characters and appearance of the wild cat. According to Bewick (*History of Quadrupeds*), wild cats are found with little variety in most climates. The domestic cat is very useful in destroying vermin, as rats and mice, and is a favourite pet, though it is not capable of much attachment.

The reindeer, which is naturally wild in the north of Europe, becomes, when tamed by the Laplander, of the greatest value to him. It serves him for food, clothing, and as a beast of burthen; by its organization it is formed for crossing the snowy wastes, which without this animal would be impassable: it will draw a great weight when attached to a sledge, and go with amazing swiftness. The riches of a Laplander are estimated by the number of reindeer which he possesses: during the winter season when the ground is covered with snow, and the ox and horse would starve, the reindeer finds plenty of food in a peculiar lichen (*Cladonia rangiferina*), which grows in the greatest abundance, and often covers the soil in steril places for miles, affording nourishment for vast herds of reindeer, which root for this vegetable under the snow like swine in a pasture. Attempts have been made to domesticate this animal in England, but hitherto they have not succeeded. The reindeer is not adapted to our climate, and does not seem likely to be of much use in any point of view even if the experiment should succeed.

The whole number of wild European mammalia at present met with is only 150, which includes 28 belonging to the whale tribe, and 8 species of phocidæ or seals, among which the morse or walrus (*Trichecus rosmarus*) is placed: these being deducted, the number of land animals is reduced to 114, a proportion very small when compared with the three other great continents: of these seventy are also found out of Europe, most of them being common to Asia; there only remain therefore forty-four quadrupeds which are now peculiar to Europe.

We have already mentioned the only quadrumanous animal found within our limits, the Barbary ape, or magot, which, though now naturalized, is probably not an aboriginal inhabitant of Gibraltar.

Of the *Cheiroptera* twenty-seven species are found in Europe, most of which belong to the genus Vespertilio, a small and harmless race of bats. The most common and best known species is the *V. murinus*, the flitter-mouse of the English, which lives in caves, ruined buildings, church towers, the roofs of houses or churches, and hollow trees, where it hybernates during the whole winter, snugly wrapped up in the wing-membranes, and suspended by the hind feet. There are two or three or perhaps more European species of the genus Rhinolphus, commonly called horseshoe bats, and one species of Plecotus has been described as found in Europe. As many as sixteen bats have been enumerated by Jenyns as inhabitants of Britain.

Most of the *Carnivora* of Europe are very insignificant animals by the side of their congeners of Asia and Africa. The only formidable beasts of prey now found within the limits of our continent are the bear, the wolf, and the lynx; but it seems probable that the lion was once met with in the south of Europe. Herodotus says that it was found in Greece between the rivers Nestus and Achelous (vii. 125); and he mentions the circumstance of the army of Xerxes being annoyed by lions on its march from Acanthus to Therme [ATHOS]. The fact of these animals having inhabited our continent is also confirmed by Aristotle, Pliny (unless he is merely copying other writers), and Pausanias. Of the genus Bear there are two species in Europe, the common brown bear (*Ursus arctos*), and the polar bear (*U. maritimus*): the former was once general over the whole continent, and is now found widely diffused in the most solitary districts from the arctic circle to the summit of the Alps and Pyrenees. It is a lonely animal, hybernating during the winter in the hollow of a tree or a cavern, where it remains till the spring without taking any sustenance. It is supposed to be nourished during that time by the fat which accumulates beneath the skin in great quantities in the summer. Cuvier describes a black bear peculiar to our continent, differing from that of America: however, as he never saw but one living specimen, and did not know its habitat, it was probably only a variety of the former species. The polar bear is almost confined to the frozen regions surrounding the north pole, but a solitary individual is occasionally drifted as far south as Iceland, or even the northern extremity of Norway and Lapland. The wolf and fox, the latter under different varieties or species, appear generally distributed over Europe: the former is even now not uncommon among the wooded and mountainous districts of France: when pressed by hunger, it will descend to the farms, and even attack the inhabitants. The lynx, once common in central Europe, has for some time been extirpated, except from some parts of Spain, the Apennines, and the northern parts of the continent: it is about twice the size of the wild cat, which is still said to be a native of Britain. The common glutton or wolverine (*Gulo arcticus*) is a native of Denmark. It is one of those animals whose history is obscured by fable: it feeds principally on dead carcases, though it will kill prey of the smaller kinds, as mice, marmots, &c.; but the stories of its falling from the boughs of trees on to the backs of deer and other large animals, and maintaining its hold there till they drop with fatigue and loss of blood, are doubtless entirely fabulous, as it is a most cowardly animal, and may be easily killed with a stick.

Of small carnivorous quadrupeds there are several species; as many as eight Mustelidæ, or weasels, inhabit different parts of Europe, which are particularly destructive to birds.

Few of the *Rodentia* of Europe require particular notice. The beaver was formerly recorded as a British animal; at present it is found in the neighbourhood of the Rhone, the Danube, the Rhine, and other large rivers on the continent. The porcupine (*Hystrix cristata*) is said to be occasionally met with in Italy, and other parts of the south of Europe. The flying squirrel (*Pteromys volans*) is an inhabitant of Denmark and Lapland, as well as one or two species of lemming (*Georychus*). The different kinds of rats and mice, of which seventeen species have been described, arranged in different genera, form an important feature in European zoology. One species of Hamster (*Cricetus vulgaris*) is distributed over central and northern Europe; and two marmots (*Arctomys marmotta* and *Bobac*); and the Spermophilus Citillus, or Soulisk of the Germans, occurs in the same region.

The *wild boar*, the only aboriginal pachydermatous animal in Europe, was formerly an inhabitant of the forests of Great Britain, and was one of the noblest and most favourite objects of the chase; it is still found on the continent.

The number of *Ruminants* found wild in Europe is very limited, there being only eight species. Of these five are deer, all of which are also inhabitants of other continents, viz., the elk or moose-deer, the rein-deer, the fallow-deer, the red-deer, and the roebuck, which are severally described in the article DEER. The three remaining animals of this order are the ibex, the chamois, and the musmon. The first (*Capra ibex*) is found, though rarely, in the Alps, still more rarely in the Pyrenees, and it is said in some other mountainous parts of Europe and Asia: it lives only in the most lofty and inaccessible places, and is sought for at the extreme peril of the hunter. The chamois inhabits also the wildest and most precipitous regions in the mountains of Europe, though it scarcely ascends to the same heights as the ibex; it is placed in the same group with the antelopes, though by some naturalists it is considered that it should form an intermediate genus between those animals and the goats. The musmon (*Ovis musmon*), the only ruminating quadruped which appears confined in its range to Europe, we have already mentioned as being the supposed parent of our domestic sheep; it has disappeared from the continent, though there is no reason for believing that it formerly existed on the mountains of Spain.

The *Cetacea* are a tribe of animals of which little is known. Their habitation being in the deepest recesses of the ocean, it is impossible to learn much of their habits and characters; and hardly any species can be said to be peculiar to one continent more than another, for the same whale may be met with on the coast of Europe at one time, and on that of America at another. A great many species frequent the shores of Europe, principally on its northern part, and the Greenland fishery is an important branch of European commerce.

The *birds* of Europe are much more numerous than the mammalia. Above 400 species have been described as regular inhabitants of our continent, and a good many more are occasional visitants; but we must confine our notice to a few of the more remarkable and typical species. In the northern or arctic regions very few birds are met with, and

most of them belong to the wading and swimming orders; to whose nourishment and increase the arctic solitudes are particularly congenial. Almost all these species are found also in the northern parts of Asia and America; and the largest proportion occur in southern latitudes, extending even to the shores of the Mediterranean. One of the most characteristic birds of arctic Europe is the great snowy owl (Strix nyctea), which preys chiefly on the ptarmigans and grouse, which frequent these northern regions in great numbers. Two other formidable rapacious birds frequent the northern countries, particularly Lapland: the Iceland falcon (Falco Islandicus), which rarely wanders to more genial climes, and another gigantic owl (Strix lapponica), which is a peculiar inhabitant of the dreary solitudes of Lapland. As we proceed to warmer latitudes, and vegetation acquires a more decisive character, the number and species of birds subsisting on the produce of the earth and on insects greatly increase. Several woodpeckers are met with in the pine forests of Norway, one of which (the Apternus tridactylus) is remarkable for having only three toes on its feet. Among the noblest and most formidable birds of central and southern Europe may be mentioned the golden and imperial eagles; the former (Aquila chrysaëtos) is an inhabitant of the wildest parts of Scotland and Ireland, and rocky places among the higher mountains on the continent. The latter (A. imperialis) is chiefly found in the southern countries. Four species of vulture are met with on the Alps, two of which are found in the north of Africa and the western part of Asia. The bearded vulture (Gypaëtus barbatus), which is almost peculiar to the Alps, is a noble bird, partaking more of the characters of the true falcons, being very courageous and sanguinary; it is above four feet and a half long, from the tip of the bill to the extremity of the tail, and will attack sheep and goats, and it is said that even the ibex and chamois are sometimes killed by it. The great-eared owl represents in central Europe the snowy species of the arctic regions; it is common in the German and Hungarian forests, and is sometimes, though rarely, met with in England. The Gallinaceous genera are few and widely dispersed. The great bustard (Otis tarda) ranges from the western extremity of central Europe to the confines of Asia. The red grouse (Lagopus Scoticus) is the only bird peculiar to Great Britain. This race of birds seems to occupy an intermediate station between the centre of Europe and the confines of its polar extremity: the largest species is the famous cock of the woods (Tetrao urogallus), once an inhabitant of the Scottish forests. The rocky and uncultivated tracts of Spain and Turkey are inhabited by two species of rock grouse (Pterocles), of a genus different from those belonging to northern latitudes. On the shores of the Mediterranean there is a union of the ornithology of Europe, Africa, and Asia: the pelican, the spoonbill, and the flamingo are there met with, though not now very plentifully. Few of the birds of Europe are remarkable for that brilliancy of plumage which is so splendid a characteristic of the birds of tropical climates, but this is, in many instances, more than compensated by their sweetness of voice. The nightingale, the best songster in the world, is common in England and other European countries, though not confined to our continent; it visits us in the breeding season, along with numbers of other warblers, or small insectiverous birds, which enliven our woods and hedges during the spring and summer. The melody of the blackbird and thrush is too well known to require any eulogy. But Europe is by no means destitute of birds characterized by the beauty of their colours, though they are chiefly confined to its southern boundaries: the wall-creeper with its bright rosy wings is common in Italy; while the golden oriole, the European bee-eater, the hoopoe, and the roller are met with in abundance in the two Sicilies during the spring and autumnal migrations; and a modern author says that 'they may occasionally be seen hanging in the poulterers' shops in Naples and Palermo.'

The *reptiles* of Europe are few, and generally harmless. The common viper is almost the only venomous serpent. Numerous little lizards are common in the houses in the southern parts of the continent, as in Italy; but most of them are not peculiar to Europe, being also found on the opposite shores of the Mediterranean. An excellent edible species of turtle inhabits this sea, which resembles in appearance the logger-head of the West Indies, but is much more palatable when dressed. The most remarkable and curious reptile in Europe is the *Proteus anguinus*, which somewhat resembles a water lizard in shape, or an eel with very imperfect legs: it is found in the lake Zirknitz, in Carniola, and more often at the bottom of the grotto of the Maddalena at Adelsberg. It was conjectured by Sir H. Davy and others not to be a natural inhabitant of the surface of the globe, but to be forced up from a subterranean lake through some crevices in the rocks. It was also doubted whether this was a perfect animal or only the larva of some other, but it has been proved to be furnished with both gills and internal lungs; its eyes are quite rudimentary and situated beneath the skin.

Insects and other annulose animals are very numerous in Europe, but few of them possess sufficient interest to require any notice in this general sketch. The scorpion is frequently found in houses in Sicily, though fortunately unknown with us. The common gnat is one of our most troublesome insects, and in warm shady places, where there is much stagnant fresh water, it will cause almost as much annoyance to some people as the mosquito of hot climates, which it closely resembles. In Sweden and other northern countries, where the summer though very short is proportionably hot, it is said that true mosquitos are more numerous than in the woods of tropical America.

Many of the *fish* which frequent the shores of Europe are very important in an economic point of view. We may particularly mention the herring, the anchovy, and the tunny, whose capture and preparation employ a great number of men, and which are also important articles of diet. Herrings (*Clupea harengus*) arrive in great shoals on the western coasts of Europe towards the end of the summer for the purpose of depositing their spawn, and at that time immense numbers are caught, particularly on the British coasts, where they abound. It was supposed by the older naturalists (and among others even by Cuvier) that the herrings migrated from the Northern Ocean in the spring, and returned there after depositing their spawn; but it is the more recent opinion (which is supported by the authority of Mr. Yarrell) that these fish inhabit the deep waters round our coasts, and only approach the shore for the purpose of spawning, and then retire again to the depths of the ocean, where they remain during the winter and spring. The pilchard (*C. pilchardus*), which belongs to the same genus as the herring, is caught only on the coast of Cornwall, where it makes its appearance in July: it goes away in the autumn, and returns in the beginning of January. The anchovy (*Engraulus encrasicholus*) is principally met with in the Mediterranean, which sea it enters in enormous shoals by the Straits of Gibraltar in the spring for the purpose of breeding, after which it retires again to the depths of the Atlantic. The most productive fishery is off Gorgona, a small island west of Leghorn, where it is carried on during the months of May, June, and July. The anchovies are fished for only during the night, and are attracted round the boats by means of fires kept burning in them. Their principal use is for forming a sauce, which is very generally known, and esteemed as a condiment.

The tunny (*Scomber thynnus*) is also an inhabitant of the Mediterranean. It was a fish well known to the antients, and made a considerable branch of commerce: the time of its arrival in the Mediterranean from the ocean was observed, and stations for taking it established in places which it most frequented. (Strabo, p. 225.) It is in the interior of the Mediterranean that this fishery is now principally carried on, particularly along the shores of Catalonia, in Provence, in Liguria, in Sicily, and in Sardinia. These fishes frequent the coasts of Britain, but not in shoals like the tunny of the Mediterranean.

The salmon (*Salmo salar*), which is one of our most valuable and finest fishes, is found in all the seas on the north of Europe, Asia, and America, but it has never been met with in the Mediterranean. According to Cuvier it comes from the Arctic seas, whence it enters in large shoals the rivers of northern countries in the spring for the purpose of spawning. In temperate climates it is towards the end of winter that the salmon quits the sea: in the more northern regions it enters the rivers when the ice begins to melt on the shores of the ocean. Though the salmon is principally confined to the more northern regions, it has not been clearly ascertained how far south it extends, but probably not much beyond the 45th degree of latitude. It occurs, though not plentifully, in the rivers on the western coast of France.

The pike (*Esox lucius*), which is a palatable and whole-

some fish, is exceedingly destructive and voracious; it has been called the fresh-water shark. It is found in almost all the fresh waters in Europe, though more plentifully in the northern than the southern parts. It sometimes grows to a very large size.

EUROPE, BOTANY OF. This continent in its most southern limits exhibits a strong resemblance to the vegetation of Africa and its adjacent islands. In Sicily, for example, along with the vine, grow, in the more steril situations, the poisonous leafless *Euphorbia Canariensis*, an inhabitant of the Canaries, and its congener *E. balsamifera*. *Euphorbia dendroides*, a fine globular shrub, is also met with in company with the castor-oil plant (*Ricinus Africanus*), and the Solanum sodomæum of Egypt. The Date, the Pisang (*Musa Paradisiaca*), and the Prickly Pear (*Cactus Opuntia*), ripen their fruit abundantly; *Agave Americana*, the American aloe, darts up its gigantic flower-stem from the midst of huge horny leaves; rice is grown; the sugar-cane is cultivated at Avola; the cotton-plant (*Gossypium herbaceum*) yields produce of the finest quality on the banks of the Simeto; while the great Italian reed (*Arundo Donax*) supplies the place of the bamboo, and furnishes the long stakes on which the vine is trained. Many parts of the south of Spain partake of this character. The *Smilax aspera* loads the bushes with its fragrant snow-white clusters, maize and Guinea corn are common articles of cultivation, the Peruvian Cherimoyer ripens its fruit in the gardens of Grenada, and the delicate melons of Valencia are as common an open crop as in the fields of Persia. At Barcelona, in the neglected botanic garden, were still found, a few years since, the Sappan tree of Brazil (*Coralpinia Sappan*), the *Schinus Molle* of Peru, and other trees from similar climates flourishing as if in their native air. In Portugal the laurel (*Cerasus Lusitanica*) seems almost identical with the Hixa of the Canaries, while the Coral trees at Lisbon unfold their noble leaves and gorgeous blossoms with all their native South American vigour. In Italy arborescent Endogens extend as far as Nice in the form of the dwarf Palmetto; and the Victor's laurel (*Laurus nobilis*), a common evergreen, is a European representation of the laurels of the Canaries. Along all these latitudes the fig, the olive, the orange, the vine, and the maize find a climate congenial to their southern constitutions. Even in valleys the olive will not exist higher than 44½° N., nor the vine produce good wine beyond 48°, except in a few sheltered places.

About the northern limits of the olive, that is to say, in the parallel of the south of France, a marked change occurs in vegetation; most of the southern equinoctial forms of vegetation either disappear or become uncommon. The Quercus Cerris, so common in Italy and Turkey, is hardly found; evergreen oaks (*Quercus Ilex*), common oaks (*Q. pedunculata* and *sessiliflora*) supply its place. Cluster pines and Scotch firs (*Pinus pinaster* and *sylvestris*) and other species, especially Pinus halepensis, grew along the sea-coast and occupy the position held by the more southern stone-pine (*Pinus pinea*); while *Juniperus Phœnicea* and *oxycedrus*, on the branches of which its peculiar mistletoe is sometimes met with, sweet chestnuts (*Castanea vesca*), the narrow-leaved ash (*Fraxinus oxyphylla*), the flowering ash (*Ornus Europæa*), mastich-trees, and Phillyreas increase the catalogue of trees, no vestige of which is to be traced much higher in a wild state. Still more to the north, where the vine begins to languish, its place is better occupied by broad plains of wheat and other corn; the hardy trees of England, elms, limes, oaks, ashes, alders, beeches, birches, willows, and poplars are found everywhere, with rich pastures and verdant fields, unknown in the land of oranges and myrtles. At last, in the more northern districts of the continent, aspens (*Populus tremula*), bird-cherries (*Prunus Padus*), birches, lime-trees, alders, junipers, spruce-firs, and pines are the principal trees that remain; barley and oats are the only corn-plants, but potatoes continue to be reared in the short cold summer.

Among plants less conspicuous than these and less popularly known, changes occur between the north and south of Europe not less striking to the eye of a botanist. In Sicily occurs a *Stapelia*, a form of vegetation so African, that Arabia Felix and Abyssinia are the nearest points where a parallel can be found. Mandrakes (*Mandragora autumnalis*) cover whole tracts in Turkey and Sicily in the autumn with their sky-blue flowers. Quantities of labiate plants, Boraginaceæ and gay Liliaceæ, Medicagos in abundant variety, an endless host of Cistus and Helianthemum, Narcissi, Tulips, many species of Ophrys, and numerous kinds of Genista and Cytisus mark a zone of vegetation corresponding very much with the distribution of the olive. To the north of this limit such plants either disappear or diminish essentially in number and variety; Apiaceous and Brassicaceous species become predominant, fungi swarm in the autumn, turnips and buckwheat (*Polygonum fagopyrum*) are cultivated advantageously, as also are hemp, flax, hops, carrots, parsnips, common clover, beans, vetches, and lucerne, as common field-crops. But in higher latitudes the predominant forms of herbaceous vegetation are numerous species of Ranunculus, Potentilla, Saxifraga, Arenaria, Primula, Mosses, and Lichens; and there also occur abundance of stunted or pigmy trailing shrubs, such as bilberries and whortleberries (*Vaccinium Myrtillus* and *uliginosum*), *Salix herbacea*, *Arbutus Alpina*, *Arctostaphylos Uva Ursi*, crowberries (*Empetrum nigrum*), and the like.

These changes take place if we merely look to the districts of the plains. In Europe, as in other parts of the world, similar alterations in vegetation occur as we ascend into the atmosphere. In Sicily for instance, with an almost tropical vegetation in the valleys, there is a transition to the middle forms of European vegetation midway on the mountain side, and then to the most northern flora at its summit, 9000 feet above the sea [ÆTNA]; and so with other mountains as we advance to the south, till at last on Sulitelma, in Lapland, not a trace of vegetation can be discovered above the height of 3640 feet.

EURY'DICE (Zoology). [ISOPODA.]

EURYLAIMUS. [MUSCICAPIDÆ.]

EURY'MEDON. [ANATOLIA, vol. i., p. 494.]

EURY'NOME, a genus of brachyurous crustaceans established by Dr. Leach, and forming the second genus of the *Parthenopians* of M. Milne Edwards, who remarks that it establishes the passage between *Parthenope* or *Lambrus* and the other *Oxyrhynchi*. The general form of the body and aspect approximates these crustaceans to *Parthenope*, whilst the disposition of their external antennæ is similar to the conformation in *Maia*. The *carapace* is nearly in the form of a triangle with a rounded base, and is strongly tuberculated and covered with asperities. The *rostrum* is horizontal, and divided into two triangular horns. The *eyes* are small; the *orbits* deep, their upper border very much projecting and separated from the external angle by a slit. The internal *antennæ* are bent back longitudinally, and the first joint of the external antennæ terminates at the internal angle of the orbit. The *epistome* is nearly squared, and the third joint of the *external jaw feet* strongly dilated externally. The *sternal plastron* is nearly oval, and its median suture occupies the two last thoracic rings. The *feet* of the first pair are scarcely longer than the succeeding ones; in the male they are rather long, whilst in the female they are very short, but less than those of the second pair; the succeeding feet diminish progressively in length. *Abdomen* consisting of seven articulations in both sexes.

Example, *Eurynome aspera*. Length about half an inch; colour lively red with bluish tints. Locality, the coasts of Noirmoutier and the Channel (La Manche), at rather considerable depths. (Leach; Milne Edwards.) [PARTHENOPE.]

Eurynome Aspera.

EURYPO'DIUS. [LEPTOPODIIDÆ; MACROPODIANS.]

EURYSTO'MIDÆ. [ROLLERS.]

EUSE'BIUS PA'MPHILI, bishop of Cæsarea, in Palestine, the friend of Constantine, and one of the most distinguished among the earlier Christian writers, was born in Palestine towards the end of the reign of Gallienus, about A.D. 264. He passed the earlier part of his life at Antioch, and acquired a great reputation for learning: it was said of him 'that he knew all that had been written before him.' He became intimate with Pamphilus, bishop of Cæsareá, who suffered martyrdom under Galerius in the year 309, and in memory of whose friendship he added to his name that of Pamphili. In 313 he was himself raised to the see of Cæsarea, which he filled until his death. He attended the great council of Nicæa, A.D. 325, where he joined his brethren in condemning the tenets of Arius; but he is said to have raised some objections to the word 'consubstantial with the Father' as applied to the son, in the Nicæan creed. His intimacy with his namesake Eusebius, bishop of Nicomedia, who openly espoused the cause of Arius, led him also to favour the same, and to use his influence with the emperor for the purpose of reinstating Arius in his church, in defiance of the opposition of Athanasius. [ARIUS; ATHANASIUS.] The party to which he attached himself were called Eusebians, from their leader Eusebius of Nicomedia; and they seem to have acted in great measure from hostility against Athanasius and his supporters, as they did not as yet openly advocate the objectionable tenets of Arius, who had himself apparently submitted to the decrees of the council of Nicæa. In 331 Eusebius attended a council at Antioch, consisting of prelates of this party, who deposed, on some insidious charge, the bishop Eustathius, a zealous supporter of the Nicæan doctrine, and offered the see of Antioch to Eusebius of Cæsarea, which he declined. At the council of Tyre, A.D. 335, Eusebius joined in condemning and deposing Athanasius on the charges of disobedience to the emperor in not reinstating Arius, want of respect to the council, and an alleged desecration of some sacred vessels. Eusebius was deputed by the council to defend before Constantine the judgment which they had passed against Athanasius; and he appears to have used his influence with the emperor to have Athanasius banished. The part which he took in this unfortunate controversy caused him to be stigmatized as an Arian, though it appears that he fully admitted the divinity of Christ; and all that his accusers can prove is, that he believed that there was a certain subordination among the persons of the Trinity. (Mosheim, *Ecclesiastical History*; and Schoell, *History of Greek Literature*, and the notes and references therein.) Eusebius of Nicomedia afterwards openly advocated the Arian doctrine under the reign of Constantius, especially at the council of Antioch, A.D. 341. Eusebius of Cæsarea died A.D. 340.

Eusebius was possessed of most extensive erudition, sacred as well as profane, and he was one of the warmest defenders and expounders of Christianity. His principal works are—1. 'The Ecclesiastical History,' in ten books, from the advent of our Saviour to the defeat of Licinius by Constantine, A.D. 324. Eusebius has been styled the father of ecclesiastical history. He is silent on the subject of the Arian controversy, although it had begun at the time when he ends his narrative. Upon the whole, his history is written with considerable discrimination and impartiality. 2. 'De Præparatione Evangelicâ,' in fifteen books. In this work he examines the various systems of theosophy and cosmogony of the antient philosophers, the purest part of which, he maintains, was borrowed from the Jewish sacred writings. Among the writers whom he quotes, and whose works are now lost, are the Phœnician Sanchoniatho and the Egyptian Manetho. From the aberrations of the heathens and the speculations of the philosophers he draws arguments in favour of the truth of the Christian doctrines. This work of Eusebius was followed by another—3. 'De Demonstratione Evangelicâ,' in twenty books, of which only ten have come down to us. It consists of further proofs of the truth of the Christian faith, chiefly directed against the Jews, being drawn from the books of the Old Testament. 4. The 'Chronicle, or Universal History,' was only known by fragments until it was lately discovered entire in an Armenian MS. version, found at Constantinople, and published by Zohrab and Mai at Milan in 1818. The work is divided into two books; the first, entitled 'Chronographia,' contains brief separate sketches of the history of the various nations and states of the old world, from the Creation till the year 325 of our æra. The author gives extracts from Berosus, Alexander Polyhistor, Abydenus, Cephalion, Manetho, and other lost writers. The second book consists of synchronical tables, with the names of the contemporary rulers of the various nations and the principal occurrences in the history of each, from the age of Abraham till the time of Eusebius. The author has made use of the works of Africanus, Josephus, and others. The discovery of the Armenian copy of Eusebius has been a valuable acquisition, as it serves to correct several errors and to supply many deficiencies in chronology and antient history. The other works of Eusebius are—5. 'Onomasticon Urbium et Locorum Sacræ Scripturæ.' 6. 'The Life of Constantine,' in four books, a piece of panegyrical biography. 7. A Life of his friend Pamphilus, of which only a fragment remains; and other minor works.

EUSTACHIAN TUBE. [EAR.]

EUSTA'CHIUS. Bartolomeo Eustachio, or Eustachius, was one of the distinguished band of Italian professors to whom we owe the restoration of anatomy and much of its advancement in modern times. He was born in the early part of the sixteenth century at San Severino, in the marquisate of Ancona. Having accomplished himself in the classical and Arabic languages, he studied medicine at Rome, and afterwards settled there with a view to practise as a physician, under the patronage of the celebrated cardinal Borromeo. The interest he could thus command and his unusual talents were sufficient to elevate him to the chair of medicine in the Collegio della Sapienza; yet he never obtained any degree of professional success, and after a long struggle with poverty and sickness, died in great indigence about 1574.

It is not surprising that Eustachius should have failed as a practical physician, for the exclusive devotion with which he pursued his favourite study must have left him little time for the cultivation of the lucrative branches of his art; but the complete failure as a teacher, of a man of so much genius and enthusiasm, is remarkable. It may be attributed perhaps to the ascendancy of the rival school of Padua, supported by the wealth of Venice, and illustrated by the established fame of Vesalius and his successors; and may be due in part to a defective temper, of which some indications may be observed in his writings, and to the jealousy with which he concealed his discoveries. Eustachius published little in his lifetime, though he lived long and laboured much; yet his treatises, short and few as they are, and composed when anatomy was yet an infant science, are of high authority even at the present day, and bear witness to the accuracy and extent of his researches. They are all in Latin, and are nearly all collected in his 'Opuscula Anatomica,' published in 4to. at Venice in 1564, by himself, and again by Boerhaave, Leyden, 1707, in 8vo. He also published an edition, with annotations, of Erotian's 'Lexicon Hippocraticum.' His principal work, 'On the Disputed Points of Anatomy,' upon which he evidently intended to rest his fame, was unpublished to the time of his death, although announced in the 'Opuscula,' probably for want of means; it was then lost, and has never been recovered; but thirty-nine copper-plates, engraved as early as 1552, and intended to illustrate the text of this work, were found at Urbino in 1712, and given to the world two years afterwards by Lancisi, with the aid of Morgagni, Pacchioni, and other anatomists of distinction. Several editions of them have since appeared with voluminous commentaries; the best is that of Albinus, published at Leyden in 1744, in folio, and reprinted in 1762. The importance attached to these plates, after so long an interval of oblivion, shows how much Eustachius must have preceded his age; and they prove that many facts of great importance in anatomy were accurately known to him, the partial re-discovery of which had shed lustre on a century and a half of subsequent inquiry.

Haller declares it to be impossible without writing a treatise on the subject to particularize the discoveries and corrections that Eustachius introduced into anatomy. The tube leading from the ear-drum to the throat, and a certain valvular membrane in the heart which bear his name are among the former.

EUSTA'THIUS, archbishop of Thessalonica in the latter part of the twelfth century, was one of the most learned scholiasts of his age. He wrote a Commentary upon the 'Iliad' and the 'Odyssey,' which is a mine of antient erudition, and contains extracts from the older commentators, such as Apion, Heliodorus, Demo-

sthenes of Thrace, Porphyrius, and others. It was first printed at Rome in the edition of Homer, 4 vols. fol. 1542-48; the latest edition is that of Leipzig, 1827. Eustathius wrote likewise a Commentary on Dionysius Periegetes, or the Geographer, which was published by Robert Estienne, 1547, and often reprinted since. He also wrote a Commentary on Pindar, which is lost. There are letters of Eustathius existing in MSS. in several libraries; but they have never been published. The novel of 'Hysmine and Hysminias,' published at Paris, 1618, has been also attributed to Eustathius, but, as it is now proved, erroneously.

EUSTA'TIUS, or **EUSTATIA, St.**, in 17° 33′ N. lat., and 63° 3′ W. long., one of the Leeward islands in the West Indies, is a small rocky island, about 25 miles in circumference, rising from the sea, in the form of a truncated pyramid, or sugar-loaf, terminating in a plain surrounded with woods, having a hollow in the centre, which is now a vast den for numerous wild beasts, and is perhaps the crater of an extinct volcano. The climate is in general healthy, but the island is frequently visited by those dreadful thunder-storms and hurricanes which have so repeatedly ravaged the West Indies. These hurricanes have usually occurred in August and September. The extraordinary fertility of the soil, aided by the industry of the Dutch, who have cultivated the island to the very summit, have rendered it one of the most flourishing and wealthy of all the Caribbee islands. The principal article of cultivation is tobacco, but they grow likewise sugar, indigo, and cotton. The island has great abundance of hogs, goats, rabbits, and poultry of all kinds, not only for the consumption of the inhabitants themselves, but for the supply of the neighbouring colonies, with which they are said to carry on a profitable contraband trade, the situation of the island being remarkably convenient for that purpose. This may be one ground of the very jealous policy of the Dutch, which is far more strict than that of the other European nations who possess any of the islands. The only landing-place, naturally difficult of access, is further guarded by a fort, and fortified so as to render it impregnable; nor has any thing been neglected to render every part of the island equally so. Strangers therefore being nearly excluded, have little knowledge of the internal affairs of the island and of the riches with which it abounds.

St. Eustatius became the property of the Dutch by the right of first occupancy; the States-General granted it to some merchants at Flushing, and it was first settled about the year 1600. In 1665, when the English were at war with the Dutch, the latter were dispossessed by an armament sent from Jamaica. In the sequel France and Holland having formed an alliance, St. Eustatius was reconquered from the English by a combined force, and the French kept a garrison in the island till the treaty of Breda, when it was restored to the Dutch. Soon after the revolution of 1688, the French expelled the Dutch from St. Eustatius, but were obliged to capitulate to Sir Timothy Thornhill, who granted them only their lives and baggage, and left a small English garrison for the protection of the Dutch, who again recovered the entire possession of the island by the peace of Ryswick. They kept it till 1781, when it was taken by the English, but restored at the peace in 1783. The English again took it in 1801, and gave it back to the Dutch in 1814.

EUSTYLE. [CIVIL ARCHITECTURE.]

EUTO'CIUS, a Greek mathematician of Ascalon, in Palestine, who flourished about A.D. 550. He was pupil of Isidorus, the architect who designed and chiefly built the celebrated church (now the mosque) of St. Sophia at Constantinople; and he became ultimately one of the most distinguished geometricians of his time.

It was the general custom of mathematical and philosophical authors, during the decline of learning, to give their views and their discoveries, where they made any, in the form of commentaries on some earlier writer. Eutocius, like Proclus and others, delivered his views in this way; and like them he furnishes some valuable contributions to the history of mathematical science amongst the Greeks.

The commentaries of Eutocius on the works of Archimedes and Apollonius are the only works by which he is known to modern readers. His commentaries on Apollonius were published in Halley's Oxford edition of the works of that author, 1710; and those on Archimedes in various editions, from that of Basil, 1544, to that of Oxford, 1792.

Of the commentaries of Eutocius, those on the treatise of Archimedes 'On the Sphere and Cylinder' are most valued; and chiefly for his account of the various modes of solving the Delian problem of the Duplication of the Cube. All of them, however, though of less value both as to historical and geometrical matter, are still interesting to every one who takes a pleasure in investigating the history of pure science.

The commentary on the 'Measurement of the Circle,' by Archimedes, was translated into German, together with the text of Archimedes to which it refers, by J. Gutenäcker, Würzburg, 1825 and 1828, 8vo.

EUTRO'PIUS, FLAVIUS, was a Latin historian of the fourth century. Little is known of his life; he was secretary to the Emperors Constantine and Julian, and accompanied the latter in his unfortunate Parthian campaign. He is believed to have been of senatorial rank. He is known as the author of a compendium of Roman history, in ten books, from the foundation of the city down to the accession of Valens, A.D. 365, which, being short and easy, has been much used as a school-book. Meagre as it is—for it might be contained in 100 common-sized octavo pages—it is still of some use towards filling up those gaps in history which are left in consequence of the total loss of some writers and the imperfect condition in which others have come down to us. The best edition is said to be that of Haverkamp, Leyden, 1729, 12mo., improved by Verseik, Leyden, 1762, 2 vols. 8vo.

EUTYCHIANS, a sect of Christians which began in the East in the fifth century. Eutyches, its reputed founder, though the opinions attributed to him are said to have existed before (*de Eutychianismo ante Eutychen*, by Christ. Aug. Selig, and also Assemani, *Bibliotheca Orientalis*, tom. i., p. 219), was a monk who lived near Constantinople, and had a great reputation for austerity and sanctity. He was already advanced in years when he came out of his retirement, A.D. 448, in order to oppose the Nestorians, who were accused of teaching 'that the divine nature was not incarnate in, but only attendant on, Jesus, being superadded to his human nature after the latter was formed;' an opinion however which Nestorius himself had disavowed. In his zeal for opposing the error ascribed to the Nestorians, Eutyches ran into the opposite extreme of saying that in Christ there was 'only one nature, that of the incarnate Word,' his human nature having been absorbed in a manner by his divine nature. Eusebius, bishop of Dorylæum, who had already opposed the Nestorians, denounced Eutyches before a council assembled at Constantinople by Flavianus, bishop of that city. That assembly condemned Eutyches, who, being supported by friends at the court of Theodosius II., appealed to a general council, which was soon after convoked by the emperor at Ephesus, A.D. 449, under the presidency of Dioscorus, bishop of Alexandria, and successor to the famous Cyril, who had himself broached a doctrine very similar to that of Eutyches. The majority of the council tumultuously acquitted Eutyches and condemned Flavianus; the bishops opposed to him were obliged to escape, and Flavianus was cruelly scourged by the soldiers; it was in short a scene of disgraceful violence, which earned for the council of Ephesus the name of 'a meeting of robbers.' Flavianus appealed to Leo the Great, bishop of Rome, who, in his answer, condemned the doctrine of Eutyches, but could not obtain of Theodosius the convocation of another council. After the death of that emperor, his successor, Marcianus, convoked a council at Chalcedon, A.D. 451, which is reckoned as the fourth œcumenical council of the Church, and which the pope's legates attended. By this assembly the acts of the council of Ephesus were annulled, Dioscorus was deposed and banished, and Eutyches, who had already been banished by the emperor, was again condemned, and deprived of his sacerdotal office. The doctrine was at the same time expounded that 'in Christ two distinct natures are united in one person, and that without any change, mixture, or confusion.' Eutyches died in exile; but several monks, especially in Syria, continued the schism, and having found a protectress in the empress Eudocia, the widow of Theodosius, who was living in Palestine, they became more daring, and excited the people against the partizans of the council of Chalcedon, whom they stigmatized as Nestorians. The emperor was obliged to send troops to repress these disorders. The doctrine of Eutyches was perpetuated in the East under certain modifications, or rather quibbling of words, which caused the sect to be subdivided under various names,

all however comprehended under the general name of Monophysites, or believers in one nature. (Assemani, 'de Monophysitis,' at the beginning of vol. ii. of his *Bibliotheca Orientalis*, and Albufarragius's *arguments* in favour of that doctrine in the same vol., pp. 288,9.) In the sixth century a fresh impulse was given to the Eutychian doctrine by one Jacob, a monk, surnamed Baradæus, who reconciled the various divisions of the Monophysites throughout the East, and spread their tenets through Syria, Armenia, Mesopotamia, and Egypt, found supporters among several prelates (among others in the bishop of Alexandria), and died himself bishop of Edessa, A.D. 588. He was considered as the second founder of the Monophysites, who assumed from him the name of Jacobites, under which appellation they still constitute a very numerous church, equally separate from the Greek, the Roman or Latin, and the Nestorian churches. The Armenians and the Copts are Jacobites, and so are likewise many Syrian Christians in contradistinction to the Melchites, who belong to the Greek church. Jacobite congregations are found in Mesopotamia.

The Monothelites who appeared in the seventh century have been considered as an offshoot of the Eutychians or Monophysites, though they pretended to be quite unconnected with them. They admitted the two natures in Christ, explaining that after the union of the two into one person there was in him only one will and one operation. This was an attempt to conciliate the Monophysites with the orthodox church, and it succeeded for a time. It was approved of by many eastern prelates, and even by Pope Honorius I., in two epistles to Sergius, patriarch of Constantinople, which are found in the Acts of the Councils. But the successors of Honorius condemned the Monothelites, and Martin I., in a bull of excommunication, A.D. 649, consigned them and their patrons (meaning the Emperor Constans, who protected them) 'to the devil and his angels.' Constans, indignant at this, caused his exarch in Italy to arrest Martin, and send him prisoner to the Chersonesus. At last, under Constantine, who succeeded Constans, the council of Constantinople, which is the sixth œcumenical council, A.D. 680, condemned the Monothelites, and with them Pope Honorius himself. (Mosheim, *The Acts of the Councils;* and Bossuet, in his *Defence of the Declaration of the Gallican Clergy*, 1682.)

EUXINE. [Black Sea.]

EVA'GORA. [Medusa.]

EVA'GRIUS, born at Epiphania, in Syria, about the year 536, practised as an advocate at Antioch, where he acquired a brilliant reputation. He was afterwards appointed quæstor, and filled other public offices. He wrote an ecclesiastical history in six books, beginning with A.D. 431, about the period where the histories of Socrates and Theodoretus terminate, and continuing to the year 593. His work is spoken of favourably by Photius. Evagrius, though not always to be trusted implicitly, yet shows greater discrimination than Socrates; he consulted the original documents, and appears to have been tolerably impartial. He was well acquainted with profane, as well as ecclesiastical history. His work was published by Robert Estienne, and afterwards by Valois, Paris, 1679, in an improved edition founded upon two different MSS. It was published again with notes at Cambridge, 1720.

EVALD, JOHANNES, the most distinguished poetical genius produced by Denmark in the eighteenth century, was born at Copenhagen, November 18th, 1743. His father, who was a clergyman in that city, possessed considerable theological attainments, but was prevented by ill health from acting as preceptor to his sons. Johannes, therefore, the second and most gifted of the three, was shortly before his father's death (1754) sent to Slesvig, where his tutor left him entirely to his own choice of books for his leisure reading. Among these were translations of 'Robinson Crusoe' and 'Tom Jones,' the former of which so captivated his imagination that he proposed its hero as a practical model to himself, and when no more than 13 years old, eloped with the view of making his way to Holland, and there get on board ship for Batavia; but he was overtaken, and his project frustrated. He was still, however, left as before to inflame his fancy with romantic reading and with legendary lore, including that of saints and martyrs, as well as of northern fable and mythology. In reading the classics it was the adventurous part that chiefly engaged his attention: indeed he had at that time no relish whatever for the beauties of the Roman poets, as he himself has acknowledged in his fragmentary autobiography. Notwithstanding he was of exceedingly weak frame of body, he longed to devote himself to a military career, and the war then carried on between Prussia and Austria afforded an opportunity; but his mother would not consent to his entering the army. Soon after, his thoughts were for a while diverted from such views by a very different object. He suddenly became violently enamoured with a young lady, a relation of his step-father's, for his mother was now married again, whom he has celebrated under the name of Arense, and his passion for whom he has described in the most glowing colours; a passion which, although hastily conceived was lasting in its effects, and which, although the source of heartfelt bitterness to him—since Arense bestowed her hand upon another—while it cast a shade of melancholy over his whole life, had a favourable influence on his poetical talent, producing in him that depth of feeling and pathos which discovers itself in his 'Balders Död' (Death of Balder). At this period, however, poetry, at least authorship, formed no part of his plans. Dissatisfied with being beneath his step-father's roof, he joined with his elder brother in the scheme of entering the Prussian service as hussars. The latter returned after reaching Hamburg, but Johannes proceeded to Magdeburg, where he enlisted, but was received only as a foot-soldier. In consequence of this disappointment he deserted to the Austrians; served in Bohemia; and was at Dresden when that capital was besieged by the Prussians. On his return to Denmark he applied himself to the study of theology, with the view of settling in that profession and marrying, when his hopes of the latter were frustrated, as already noticed. He now regarded with indifference all schemes of earthly felicity; and it was in this frame of mind that he took up his pen and produced his 'Lykken's Temple' (The Temple of Fortune, a vision), which at once stamped his reputation. This was succeeded by his 'Adam and Eve,' a dramatic composition replete with poetical energy, yet in many respects defective and anomalous. Conscious of its imperfections, he devoted two years entirely to the study of poetry and the best models, in order to prepare himself for some more finished undertaking. Having made himself master of the English language, he carefully perused Shakspeare, with whom he was before acquainted only through Wieland's translation. Ossian was likewise a favourite with him, and when he again took up his pen, he composed his 'Rolf Krage,' a tragedy strongly tinctured with Ossianic taste. It was first given to the public in 1770; about which time he was attacked with a most painful disorder in his limbs, that continued to afflict him with little intermission during the rest of his life. Notwithstanding his severe sufferings, he not only pursued his literary occupations, but wrote his comedy of 'Harlequin Patriot,' a masterpiece of its kind, abounding with pleasantry and satire chiefly directed against pseudo-reformers. In the following year, 1773, he executed his literary chef-d'œuvre, 'Balders Död,' a drama of extraordinary poetical beauty, and greatly superior to anything of the kind that had then appeared in the Danish language. Yet although well received, its merits were not so well appreciated by its author's contemporaries as they have been since. Although it is on this and his other poetical works that his reputation chiefly rests, Evald produced several things in prose, some of which—as his 'Forslg om Pebersvende' (Project respecting Old Bachelors), are replete with shrewd satire and strong comic humour, notwithstanding they were written when he had to contend both with ill-health and distressed circumstances. Their liveliness forms a strong contrast to the seriousness and even melancholy that pervade his other writings; in which respect he presents a parallel to the author of 'John Gilpin.' There is likewise another point of resemblance between Evald and Cowper; each in his affliction met with generous sympathy and succour from a female friend. What Mary Unwin was to the one, Madame Skou was to the other; and it was beneath the hospitable roof of the latter that the Danish poet breathed his last, on the 17th March, 1781, after being confined during two years to his bed or arm-chair, and almost deprived of the use of his limbs. The two poets may further be likened to each other for the high moral tone of their writings, vividness of conception, and happiness of expression.

EVANGELIST is the Greek appellation *Euangelistes* (εὐαγγελιστής, from εὖ and ἄγγελος), which signified a messenger of any good news, as in Isaiah xli. 27, of the Sep-

tuagint version. In the first ages of Christianity it was a general name of all those who, either by preaching or writing, announced the 'glad tidings' of the Christian revelation. The learned Hooker, in his 'Ecclesiastical Polity,' b. v. § 78, says that 'Evangelists were presbyters whom the apostles sent forth, and used as agents in ecclesiastical affairs.' They were similar to the class of ministers who in modern times are known as itinerant preachers. The deacon (subordinate minister) Philip is called an evangelist (*Acts* xxi. 8: see Grotius on the passage); so Ananias, Apollos, Timothy, and several others. St. Paul, in his epistle to the Ephesians (iv. 11), places evangelists in the third rank of ecclesiastical officers; thus, apostles, prophets, evangelists, pastors, teachers. The use of the term is now confined to the four writers to whom the canonical gospels are attributed, Matthew, Mark, Luke, and John, and the gospels themselves are not unfrequently, though incorrectly, called the Evangelists. St. Jerome states that the symbols of the four evangelists are a man, a lion, a calf, and an ox; but St. Augustine declares them to be a lion, a man, an ox, and an eagle. (*Ezekiel*, i. 5-10; *Rev.* iv. 7.) Dr. Campbell, in his 'Dissertation on the Gospels' (vol. i. p. 126, &c.), gives a variety of learned and critical remarks on the word εὐαγγελίζειν as the translation of the Hebrew בשר *bashar*, 'læta annunciare,' 'to announce good tidings.' (See the word in Rose's ed. of Parkhurst's *Gk. Lex. of the N. T.*, and a list of works on the Evangelists in Watt's *Bibliotheca Britannica*, and Horne's *Introduction to the Bible.*) General histories of the four Evangelists have been written by Kirstenius, Spanheim, Mollerus, Florinus, Schrœder, &c.

EVAPORATION. [HEAT.]

EVECTION. [LUNAR THEORY.]

EVELYN, JOHN, author of 'Sylva,' 'Memoirs,' &c., was the second son of Richard Evelyn, Esq., of Wotton, in Surrey, and was born at that place October 31, 1620. He received his education at Lewes' free school and Baliol College, Oxford. In 1641 he went abroad, and served for a short time as a volunteer in Flanders. Instead of taking arms in the royalist cause, as his family politics would have inclined him, he went abroad a second time in 1644, with the king's permission, and spent, with one interval, the next seven years on the continent, diligently employed in studying natural philosophy, cultivating his taste in the fine arts, and acquainting himself with such particulars of manners, trade, and manufacture as were most worthy of notice. In June, 1647, he married the daughter of Sir Richard Browne, the royalist ambassador at Paris, and in right of his wife became possessed of Sayes Court, near Deptford, where he fixed his abode on returning to England in 1652. He lived in privacy and study till the Restoration; after which, being much esteemed by the king and of some weight by family, fortune, and character, he was often withdrawn from his retirement and engaged in many capacities in the public service. He was appointed a commissioner to take care of the sick and wounded, on the Dutch war breaking out in 1664, commissioner for the rebuilding St. Paul's, a member of the Board of Trade on its first institution, &c. He was also one of the first members of the Royal Society, and continued through life a diligent contributor to its 'Transactions.' His most favourite pursuits were horticulture and planting, upon which he wrote a variety of treatises, which are collected at the end of the fifth edition (1729) of his 'Sylva, or a Discourse on Forest-trees and the Propagation of Timber in his Majesty's Dominions,' first published in 1664. The object of this, the best known and chief of Evelyn's works, was to encourage planting, both as a matter of national interest and of private adventure. It sold largely, and, as Evelyn himself says, had no small effect. In the same year he published the first 'Gardener's Almanac,' containing directions for the employment of each month. This was dedicated to Cowley, and drew forth one of his best pieces, entitled 'The Garden,' in acknowledgment.

Mr. Evelyn's works on the fine arts are: 'Sculpture,' 1662, a history of the art of engraving, in which the first account is given of Prince Rupert's new method of mezzotinto engraving: 'A Parallel of Antient and Modern Architecture,' 1669: 'Numismata, a Discourse upon Medals,' 1697. All these, though long superseded, were much esteemed, and were in fact valuable additions to the then existing stock of literature.

By the death of his brother, in October, 1699, Mr. Evelyn succeeded to the family estate at Wotton, where he died, February 27, 1706, full of honour as of years. He was a diligent and successful labourer, in that age of discovery, in the subordinate departments of science; a valuable pioneer, as he used to call himself, in the service of the Royal Society. Besides this, he was a model for the character of a gentleman. A friend of the learned and the good, devoid of jealousy, pious, beneficent, intellectual, delighting in the occupations of his station, yet always ready to quit them for the public service: he was respected even by the court profligates to whom his example was a daily reproach. To the present age he is best known by his Memoirs, a journal extending nearly from his childhood to his death, which contains much curious matter relative to his travels, and to the manners and history, political and scientific, of the age. Many of his letters, and the private correspondence of Charles I. with Secretary Nicholas, and Clarendon with Sir R. Browne, are subjoined to these memoirs, which were first printed in 1818. (Kippis, *Biog. Brit.*; *Preface and Appendix to Memoirs.*)

EVERGEM, a town and commune of East Flanders, in the district of Ghent, about three miles north of the city of Ghent, in 51° 8′ N. lat. and 3° 44′ E. long. The canal of Sas-de-Gand, which connects Ghent with the Scheldt, passes Evergem, the little river Caele runs on the south of the town, on the south-west is the Ghent and Bruges canal, and on the west the Liève, which rises in the north-east quarter of West Flanders and joins the Bruges canal near Evergem. The population of the town is 7790; it contains establishments for cotton-printing and dyeing, breweries, distilleries, and a salt-refinery. Cotton and linen weaving give employment to many of the inhabitants. In 1832 the town contained a communal and six private schools: in the former 57 boys and 49 girls were taught, and in the latter 261 boys and 211 girls.

(Vandermaelen's *Dictionnaire Géographique de la Province de la Flandre Orientale.*)

EVERGREENS, in horticulture, are plants which shed their old leaves in the spring or summer after the new foliage has been formed, and which consequently are verdant through all the winter season; of this nature are the holly, the laurel, the ilex, and many others. They form a considerable part of the shrubs commonly cultivated in gardens, and are beautiful at all seasons of the year.

The principal circumstances in which evergreens physiologically differ from other plants are the hardness of their cuticle, the thickness of the parenchyma of their leaves, and the small number of breathing pores formed on the surface of those organs. These peculiarities, taken together, enable them to withstand heat and drought with more success than other plants, but are often not sufficient to protect them against such influences in excess. Hence we find them comparatively uncommon in those parts of the continent o Europe where the summers are hot and dry, and most flourishing in a moist insular climate like our own. This is rendered more intelligible by a comparison of the proportions borne by their evaporating pores, or stomates, and those of deciduous plants. As far as this subject has been investigated, it appears that their leaves are usually altogether destitute of such organs on the upper side, and that those of the lower are mostly fewer in number and much less active than in deciduous plants.

The greater part of evergreens are raised from seed; some are propagated by cuttings or layers, and the variegated varieties by budding and grafting. The soil in which they succeed best differs with the kinds; American evergreens, such as rhododendrons, kalmias, &c., grow best in equal quantities of peat earth, sand, and vegetable mould; European sorts grow in their greatest vigour in a fresh hazelly loam, but will thrive in almost any kind of soil.

The operation of transplanting evergreens may be performed with success at almost all seasons of the year. *Midsummer planting* has even been recommended; it however is a work of necessity rather than propriety, because its success depends entirely upon the nature of the weather after the operation; if it be cloudy and wet for some time they may succeed; but if, on the contrary, it be hot and dry, they are sure to suffer: for this reason, if the practice may be adopted, it is not to be recommended. The common holly however has been often known to succeed when planted at this season, either for hedges or as single plants. The hollies in one very remarkable case, were carefully dug up in the cool of the evening and removed to large trenches

which had been prepared for their reception; a quantity of water was then poured upon the roots, and the soil thrown upon the top of it, which of course was carried down and deposited in all the crevices in the trench, rendering the plants perfectly firm. In the instance alluded to the weather was very favourable for a considerable period after the operation was performed.

Autumn and spring are much better seasons for work of this kind; the plants are not so liable to suffer from the intense heat of the sun, and are more likely to be benefited by dews and frequent rains.

But, according to the most experienced cultivators, the winter months (that is, from October to February) are decidedly the best time for transplanting evergreens. Mr. McNab, who is one of the greatest authorities upon this subject, says—'I have planted evergreens at all seasons of the year with nearly equal success, except from the middle of June to the middle of August, and even during this period I have planted some; but unless the weather is very dull and moist, it is difficult to prevent the plants suffering considerably, and in many cases it is years before they recover. Although, however, I have planted evergreens ten months out of the twelve with little difference of success, yet one season has a preference over the others with me, and when there is the power of choice I would recommend late in autumn, winter, or early in spring; that is, any time from the middle of October till the middle of February; and, in general, the beginning of this period is the best; that is, from the middle of October till the middle of December; always providing that the weather and the ground are favourable; that is, supposing there is no frost, no drying wind, nor much sunshine, and that the ground is not too much saturated with wet, either from continued rain, or from the nature of the soil. One of the principal things to be attended to in planting evergreens is to fix on a dull day for winter planting, and a moist day for spring and autumn planting.'

It is of great importance to keep a number of the more tender sorts of evergreens in pots, in order to send them to a distance if required; and if they are to be transplanted at home their roots are not so liable to be injured as when they are dug from the ground. The more tender species of the following genera should be treated in this way:—Arbutus, Cupressus, Daphne, Erica, Juniperus, Laurus, Magnolia, Phyllirea, Pinus, Quercus, Rhamnus, Thuja, &c.

In lifting evergreens particular care should be taken of the young rootlets, as upon their preservation the success of the operation, in a great measure, depends; especially if the specimens have arrived at any unusual size. Small evergreens are planted like other things; but the following precautions should be observed in all cases where individuals of any great size are the subject of the operation.

When the plant has been lowered into the hole dug for its reception, the soil must be thrown in loosely around it (not trod in), and a basin made to hold a quantity of water, which must be filled several times until the whole is completely saturated; this will convey the particles of soil down to the roots of the plant, and render it much more firm than any other method. By this treatment we have seen plantations of evergreens formed without a single failure, which, when finished, appeared to have been growing for many years.

It matters little what size the plants have attained, if they can only be lifted without injuring the small fibres of the roots: they have been moved, from ten to twenty feet high and otherwise large in proportion, with complete success. Should, however, the roots be unavoidably injured in transplanting, the branches must be closely pruned and shortened in proportion; so that when they begin to draw upon the roots for support they may not require more nourishment than the latter can supply.

Considering the great importance of evergreens in a climate like that of Great Britain, where they flourish in such unrivalled beauty, and form so much natural protection to bleak exposed situations, they cannot be too extensively planted. The following lists will furnish information as to the principal kinds to be procured in the nurseries:—

I. *Evergreens whose beauty depends exclusively upon their foliage.*

TREES.

Abies. All the species, where the soil is light enough to suit them; particularly *A. Douglasii*, *excelsa*, the Norway Spruce, *Deodara*, the Cedar of India, *Cedrus*, the Cedar of Lebanon, and *Larix*, the common Larch, together with *balsamea*, the Balm of Gilead, *picea*, the Silver fir, and *Webbiana*, the Silver fir of the Himalaya mountains. [ABIES.] The Cedar of Lebanon will grow well in a swamp.

Araucaria imbricata, the glory of the mountains south of Chili: it will hardly succeed north of the midland counties.

Cunninghamia lanceolata, the Chinese fir; very handsome, but only suited to the south of England.

Cupressus sempervirens, the common cypress, and *C. horizontalis*, the spreading cypress, are quite hardy: and the latter, if to be procured, forms a tree much more ornamental than the other with its formal shape. But the nurserymen almost always sell a slight variety of *C. sempervirens* for it.

Cupressus lusitanica, the Cedar of Goa, is a beautiful tree, but only suits the climate of southern counties.

Ilex Aquifolium, common Holly: the nurseries contain endless varieties of it, both green and variegated. The latter are not to be compared with the others for beautiful effect.

Juniperus. The *J. excelsa* forms a fine tree; *J. Virginiana*, the common Virginian Cedar, is less handsome: but both are quite hardy. [JUNIPERUS.]

Pinus. All the species where the soil is light and steril enough, with that proportion of decayed unfermented vegetable matter which this genus delights in. The finest, as ornamental plants, are *P. pinaster*, *taurica*, *Pinea*, the stone pine, *nigricans*, *halepensis*, and *Pallasiana*, which will grow in any soil that is not stiff and swampy in winter. *P. sylvestris* and *nigricans* are the hardiest.

Quercus. The *Ilex*, or Evergreen oak, of which there are many varieties; *austriaca*, of which the Lucombe and the Fulham oaks are possibly domesticated forms; *Turneri*, *Suber*, the cork-tree, and *gramuntia*, the *Bellota*. or Spanish oak with sweet acorns, are all fine species equally handsome when young as bushes, and when old as trees. [QUERCUS.]

Taxus baccata, the common Yew, and *fastigiata*, the Irish Yew.

Thuja occidentalis, the American, and *orientalis*, the Chinese Arbor Vitæ.

SHRUBS OR BUSHES.

Aristotelia Maqui, a Chilian broad-leaved shrub, quite hardy.

Abies Clanbrasiliana, a curious dwarf fir, only suited to plant singly upon grass.

Cunninghamia lanceolata, the Chinese fir, rarely grows beyond the size of a bush.

Arbutus Andrachne, the Oriental Strawberry tree, and *hybrida*.

Aucuba Japonica, a Japanese spotted-leaved bush.

Buxus sempervirens, the tree Box; will succeed in light, especially sandy, steril soil; prefers chalky downs; will not thrive in stiff wet soil.

Juniperus communis, the common juniper; *Suecica*, the Swedish juniper, much less handsome; *Sabina*, the Savin bush, excellent for undergrowth and ornamental as a single bush upon lawns.

Laurus nobilis, the sweet bay, quite hardy, though a native of 'the warm south;' its aromatic leaves employed in confectionary, pickles, &c.

Ligustrum vulgare, the common privet; excellent for hedges and for undergrowth, especially the *evergreen* variety.

Phyllirea. Every variety of this valuable genus should be cultivated; *obliqua* and *latifolia* as large species, *media* as a middle-sized one, and *angustifolia* as a graceful bush.

Pinus pumilio or *Mughus*, the alpine pine tree.

Rhamnus alaternus, of which there are several varieties and *R. Clusii*; hardy bushes, which bear pruning cutting down to the ground remarkably well.

TWINERS.

Hedera. Many varieties of the common ivy; *Canariensis* the Irish ivy; and *chrysocarpa*, the golden-berried.

II. *Evergreens whose flowers have a conspicuous appearance*

TREES.

Andromeda arborea requires peat; grows 40 feet high in North America.

Arbutus Unedo, the common strawberry tree; of this there is a beautiful variety with deep red flowers, and another with double flowers, much less handsome than either.

Acacia affinis grows without protection near Edinburgh; *dealbata, lophantha*, and several other New Holland species, will flourish without protection in the southern counties.

Eucalyptus perfoliata, pulverulenta, exist in the open air near Edinburgh; they and other species will thrive in the South and West of England.

Ligustrum lucidum, the wax tree, a Japanese plant.

Magnolia grandiflora, with many varieties; they are scarcely hardy enough to live in this country away from the shelter of a wall, except quite in the south; unprotected specimens exist, however, near Edinburgh.

SHRUBS OR BUSHES.

Andromeda. The handsomest species are *A. Catesbæi, angustifolia, Mariana*, which is rather tender, *pulverulenta, speciosa*, and *floribunda*. Require peat soil.

Arctostaphylos Uva Ursi, a trailing plant.

Ammyrsine Lyoni, a beautiful little American bush, requiring peat.

Berberis aquifolium, fascicularis, repens, Asiatica, aristata. [BERBERIS.]

Bupleurum fruticosum stands the sea-breeze well upon chalky cliffs.

Cistus, all the species. They are quite hardy if planted where wet cannot lodge in winter, and exposed to the full sun in summer.

Colletia spinosa.

Cotoneaster microphylla and *rotundifolia*, small bushes.

Cytisus scoparius, common broom; there is a double variety; *albus*, the Portugal white broom.

Daphne. All handsome, the following the most so: *Laureola*, the spurge laurel, grows well beneath trees; *pontica*, with pale green fragrant flowers; and *Cneorum*, or Garland flower, one of the most lovely and sweetly perfumed plants in the world, but not to be cultivated except in a dry peaty soil and a well ventilated situation; late spring frosts injure it so much that it is not worth cultivating in valleys.

Duvaua dependens, and some others.

Erica Australis, carnea, stricta, Mediterranea, codonodes. [ERICA.]

Escallonia rubra, illinita, montevidensis, handsome South American shrubs. Bees take great delight in the blossoms of the last; the second species smells very strongly of melilot.

Garrya elliptica, with long pendulous catkins of a yellowish green colour.

Genista tinctoria, the dyer's broom, with a few others.

Helianthemum of all kinds, to cover rockwork, or ground where the wet does not lodge in winter.

Kalmia latifolia, angustifolia, especially the first; require peat.

Lavandula spica and *latifolia*, common lavender.

Ledum latifolium, or Labrador tea, and *palustre;* low bushes requiring peat.

Menziesia polifolia or Irish heath; there is a white variety.

Myrtus communis, and its varieties; lives out of doors south of London.

Prunus Laurocerasus, the common laurel; *lusitanica*, the Portugal laurel.

Pittosporum Tobira, quite hardy south of London; sweet-scented.

Rosmarinus officinalis, common rosemary.

Rhododendron. Numerous varieties are to be procured; those of *ponticum, maximum*, and *catawbiense* are the most robust; *hybridum* obtained between the Indian and American species is less hardy; *ferrugineum* and *hirsutum*, dwarf alpine species; *campanulatum*, a North Indian species.

Spartium Junceum, Spanish broom; and *acutifolium*, a Turkish broom.

Viburnum. Of the Laurustinus, one of the prettiest of all evergreens, there are three species; *V. Tinus*, the common Laurustinus, the hardiest; *V. lucidum*, with shining leaves, rather larger and more delicate; *V. strictum*, with upright shoots, more hairy, and the least hardy of the three.

Ulex Europæus, the common furze; a double variety, which is particularly handsome; and *U. strictus*, the Irish furze, a smaller species, which does not flower abundantly.

Yucca. Several species quite hardy. They only require to be grown in places where water does not stagnate in winter; *Y. gloriosa, filamentosa, Draconis, flaccida*, and *superba*, are the handsomest species.

TWINERS OR CLIMBERS.

Bignonia capreolata, with dull brownish-red trumpet-shaped flowers; rather tender.

Caprifolium flexuosum, gratum, japonicum, sempervirens; all handsome honeysuckles.

Jasminum revolutum and *officinale*, the common white jasmine.

Vinca major and *minor*, the larger and smaller periwinkle; trailers.

EVERLASTING FLOWERS. This name is popularly given to certain plants whose flowers have the property of retaining their brightness and colour for many months after being gathered. They owe this quality to a hardness of their tissue, which has exceedingly little moisture to part with, and which, consequently, does not collapse or decay in the progress of acquiring perfect dryness. It is generally in the scales of the involucre of composite plants or in the bracts of others that this property resides. Those who wish to possess such plants will easily find the following in the gardens of this country.

Hardy annuals. *Helichrysum bracteatum* (yellow), *Xeranthemum annuum* (purple or white).

Hardy perennials. *Antennaria dioica* (pink), *triplinervis* and *margaritacea* (white). *Ammobium alatum* (white). *Gnaphalium stœchas* and *arenarium* (yellow).

Tender annuals. *Rhodanthe Manglesii* (red), *Morna nitida* (yellow), *Gomphrena globosa* (purple).

Greenhouse shrubs or herbaceous plants. *Astelma eximium* (crimson), *Helichrysum argenteum* (white), *ericoides* (pink), *sesamoides, proliferum*, and others (purple).

EVESHAM, a borough and market-town, having separate jurisdiction, locally situated in the hundred of Blackenhurst, in the county of Worcester, 15 miles south-east from Worcester, and 96 north-west-by-west from London. Evesham was formerly called 'Eovesham,' or 'Eovesholme,' an appellation derived from 'Eoves,' a swineherd of Egwin bishop of Wiccii, who was superstitiously supposed to have had an interview with the Virgin Mary on this spot. It owes its importance to an abbey that was founded here in 709, and dedicated to the Virgin.

The abbot and the convent received numerous grants of land, as well as ecclesiastical and temporal privileges from various kings and other benefactors. The last abbot but one was Clement Lichfield, who built the isolated tower, now almost the only relic of this once celebrated abbey. This tower, called the Abbot's Tower, is a beautiful specimen of the pointed architecture of the period immediately preceding the Reformation it is supported by panelled buttresses, adorned with windows having rich ogee mouldings, and surmounted by open embattled parapets and eight pinnacles. It was originally intended for a campanile, to which purpose it was converted in 1745. The tower is 110 feet in height, and is 22 feet square at the base.

A battle was fought near Evesham on the 4th of August, 1265, between Prince Edward (afterwards Edward I.) and Simon Montfort, earl of Leicester. Leicester placed King Henry III., whom he had made prisoner, in the van of his army, hoping that he might be killed by his son's troops, who were fighting for his release. However, the king was recognised nearly at the first onset by the prince, who rushed through the thickest of the battle to the assistance of his father, and soon placed him in safety. Leicester's defeat was complete, and he himself, as well as his son, fell in the field of battle.

The corporation claim prescriptive rights and privileges, but they were all confirmed by charter in the 3rd year of the reign of James I. They had the power of trying and executing for all capital offences, except high treason; and as late as 1740 a woman was burnt for petty treason. A court of record is held every Tuesday for the recovery of debts to 100*l.*; a court of session is also held for the borough on the Friday after the county quarter-sessions. The borough returned two members to parliament in the 23rd of

Edward I., and again in the reign of James I., since which time it has continued to do so. In 1831 there were 3991 inhabitants: the number registered is 359. Evesham is one of the few municipal boroughs the boundaries of which were not altered by the Reform and Municipal Corporation Acts. The town is pleasantly situated on the banks of the river Avon, over which is a stone bridge, which connects it with the parish of Bengworth, which is within the boundaries of the borough. The two principal streets are wide and clean, and the town has a cheerful appearance. The Vale of Evesham is famous for the richness of its soil; and large portions of land near the town are laid out in gardens, which supply the neighbouring towns and villages with vegetables and fruit. There are also some corn-mills, and a linseed-oil mill. The market-day is Monday. Fairs are held on the 2nd of February, the Monday after Easter, Whit-Monday, and the 21st of September: the latter is famous for cattle and horses.

The borough comprises the parishes of All-Saints, St. Lawrence, and Bengworth, in the archdeaconry and diocese of Worcester. The living of All-Saints is a vicarage, which, with the curacy of St. Lawrence, is of the clear annual value of 208*l.* The church is said to have formed part of the abbey: it is in the later style of English architecture, and has a tower, spire, and a handsome porch. The church of St. Lawrence is now quite in ruins, and forms a beautiful specimen of the ornamented Gothic. In the south aisle is the chapel of Clement Lichfield; it is only 18 feet by 16, but is (as Tindal says) of such elegance and delicacy of construction as a verbal description would but very imperfectly convey to the reader's imagination.

There are places of worship for Baptists, Quakers, Wesleyan Methodists, and Unitarians. The free grammar-school, endowed originally by Abbot Lichfield, was re-founded by Henry VIII., and again re-modelled by James I. The master receives 10*l.* per annum from the crown, a house, and some other emoluments. At Bengworth there is a school, founded by John Deacle in 1709, for poor children of that parish. There are also several donations to the poor, and for apprenticing children.

In the parish of Bengworth was a castle belonging to the Beauchamp family, but it was destroyed by Abbot William D'Andeville in 1169, and the site was converted into a burying-ground, for which we believe it has continued to be used down to the present day. (For a full account of the abbey and antiquities, see Tindal's *History of Evesham.*)

EVIDENCE (*Judicial*). Evidence, in jurisprudence, denotes the means by which facts are ascertained for judicial purposes. The practical importance of the subject is obvious from this definition; and it has accordingly not only attracted much attention from judicial writers, but has formed a prominent part of the systems of jurisprudence of most civilized countries, though the particular rules of evidence adopted have varied according to the constitution of the tribunal by which judicial truth is to be ascertained. Thus the Roman law, in which facts are ascertained for judicial purposes by professional judges, contains (so far as we now know it) few regulations respecting evidence, the whole subject being comprised in one short chapter of the Digest, which lays down several positive rules for the exclusion of witnesses within prescribed degrees of consanguinity to the litigant parties. In the common law of England, where facts are ascertained by juries, the body of rules and restrictions denominated the law of evidence has been gradually established within the last two centuries. Previously to that time, in the infancy of the trial by jury, as we understand that institution, the only positive rules respecting evidence were those which related to the two witnesses in treason required by statutes passed in the reign of Edward VI. This fact of the gradual development of restrictions upon the admission of testimony seems to show that, in this country at least, the tendency of civilization has been to contract and not to enlarge (as some writers have supposed) the rules of judicial evidence. The accounts of our earlier judicial proceedings contained in the State Trials sufficiently prove that it was the practice formerly to admit without scruple or question every species of testimony; whereas the present law of evidence is almost wholly composed of restrictive rules.

In giving a compendious view of the principles of the English law of evidence (which are the same at equity as at common law, and in criminal and civil proceedings) it is proposed—1. To enumerate the limitations which it prescribes to the competency of witnesses; 2. To give a brief summary of the principal rules by which the reception of oral evidence is governed; and 3. To state the principal rules which relate to written evidence.

I. *Of the competency of witnesses.*—The general rule of English law upon this subject is, that all persons may be witnesses in courts of justice who have sufficient understanding to comprehend the subject of their testimony, and sufficient religious principle to ensure a right sense of the obligation of an oath to speak the truth. Thus very young children are admissible as witnesses, if they have a competent knowledge of the nature of an oath, and a religious apprehension of the consequences of falsehood. All testimony, by the law of England, must be given under the sanction of an oath; but the form of the oath is immaterial, and nothing is required beyond a persuasion upon the mind of the witness that in swearing to the truth of what he states he is appealing to a Divine Being able to punish him for falsehood.

To the general rule of the admissibility of all persons of sufficient intellect and religious belief there are several important exceptions. In the first place, a husband cannot be a witness for or against his wife, nor a wife for or against her husband; a rule which is said to arise from the identity of interest subsisting in such a connexion. However, in criminal prosecutions founded upon personal violence committed by either of these parties upon the other, such testimony is admitted upon the ground of necessity. Secondly, in actions at the common law, a party to the suit cannot be examined as a witness; but in courts of equity defendants in a cause may be made witnesses upon a special application for that purpose; and in those courts, if a plaintiff consents to be examined as a witness his evidence may be admitted. Thirdly, a person cannot be a witness who has been convicted of treason or felony, or of any offence which involves the *crimen falsi* (such as perjury or cheating), or which is liable to a punishment which the law considers infamous, as whipping, branding, or the pillory. This principle of exclusion, which is derived from the Roman law (*Digest*, lib. ii., tit. *De Testibus*), is now of little practical importance, as the recent statutes have enacted that a pardon in felons, or the actual endurance of the punishment in felony or misdemeanour, excepting perjury or subornation of perjury, shall have the effect of restoring the competency of the party as a witness. Fourthly, the law of England excludes the evidence of those who have a direct interest in the result of the proceedings in which they are called to testify. The indefinite state of the rule respecting the nature of the disqualifying interest has led to much perplexity in its practical application.

The principle however which is illustrated by a great variety of cases, is, that, in order to disqualify a witness on the ground of interest, he must either be directly and immediately benefited by a result of the proceeding favourable to the party who calls him, by exonerating himself from a liability to costs or to some process founded upon the decision of the cause in which he is called to testify; or he must be in such a situation as to be able to avail himself of the decision of the cause, by giving it in evidence in support of his own interest in some future litigation. The first of these alternatives is, in fact, nothing more in principle than a part of the same proposition which excludes the parties to a suit from being witnesses; for where the determination of the suit in one way directly affects the witness in interest, he is in a certain sense a party to it, and would, in fact, be testifying in his own cause. The second section of the rule which is peculiar to the law of England, and first appeared in practice about fifty years ago, is of more doubtful expedience. It is much more exclusive in its operation than the former, and is objectionable and inconvenient in practice by introducing into the question of the competency of a witness in a particular action the complicated and embarrassing process of considering his position in every supposable litigation which may afterwards affect him as arising out of that action. With the view of removing the practical difficulties arising from this objection, it was enacted by the stat. 3 & 4 Will. IV., c. 42, § 26, that 'if any witness shall be objected to as incompetent, on the ground that the verdict or judgment in the action on which it shall be proposed to examine him would be admissible in evidence for or against him, such witness shall nevertheless be examined; but in that case a verdict or judgment in that action in favour of the party on whose behalf he shall have

been examined, shall not be admissible in evidence *for* him; nor shall a verdict or judgment against the party on whose behalf he shall have been examined be admissible in evidence *against* him. By the 27th section, it was enacted that the name of every witness objected to as incompetent, on the ground that the verdict or judgment in the cause in which he is examined would be admissible in evidence for or against him, shall, at the trial, be indorsed on the record on which the trial shall be had, together with the name of the party on whose behalf he was examined, and shall be afterwards entered on the record of the judgment; such indorsement or entry to be sufficient evidence that such witness was examined in any subsequent proceeding in which the verdict or judgment shall be offered in evidence.

II. *The principal general rules by which the reception of oral evidence is regulated.*—The first general rule (which applies equally to written as to oral testimony) is that all evidence produced must be relevant to the point at issue between the parties. The object of special pleading by the common law is to reduce controversies between parties to particular issues, or propositions of fact affirmed by one and denied by the other, which are to be decided by the jury; and the rule of evidence, that the proofs in the cause must be strictly confined to these issues, is founded upon obvious reasons of justice as well as convenience. Secondly, the affirmative of every issue is to be proved; that is, the party who asserts the affirmative of a proposition is to bear the burthen of proving it. This principle is taken from the civil law; 'Ei incumbit probatio qui dicit, non qui negat.' Thirdly, in proving a fact, the best evidence of it must be given of which the nature of the thing is capable. Thus, a party is not permitted to prove the contents of a deed by a copy, and still less by oral testimony, where the deed itself may be produced; nor to prove the execution of a deed by any other person than a subscribing witness, when he is living and producible. This rule is justified by the presumption which the offer of secondary evidence raises, that the production of the best evidence might have prejudiced the party in whose power it is, had he produced it. This rule is not, however, to be understood as requiring that all the evidence which can be given upon the fact in dispute should be produced; as, for instance, if there are several attesting witnesses to a deed or other contract, it is not necessary that more than one should be called. Fourthly, hearsay testimony, which is a statement on oath of what an absent person has said respecting a fact to be proved, is, in general, excluded both on the ground that the witness to the actual fact does not declare his knowledge upon oath, and also because he is absent from the cross-examination of the party who is to be affected by what he states. To this rule, however, there are the following exceptions:—1. The declarations of persons who are in imminent danger and under the apprehension of immediate death, and who are therefore considered to be speaking under as powerful a religious sanction as the obligation of an oath; 2. The declarations of deceased persons, and made against their interest; as, for instance, charging themselves with the receipt of money on account of third persons, or acknowledging the payment of money due to themselves; 3. The declaration of deceased persons respecting rights of a public nature, such as the boundaries or general customs of a manor or district; 4. The declarations of deceased persons on questions of pedigree, or family occurrences of antient date before the memory of living witnesses, such as births, deaths, or marriages. With respect to the two last exceptions, however, evidence of declarations of this kind is inadmissible, if they have been made *post litem motam*, that is, after the matter to which they relate has become the subject of litigation.

III. *Written evidence consists of records, documents under seal, as charters and deeds, and writings not under seal.*—Acts of parliament are records of the highest nature, being the memorials of the legislature; but a distinction is made with respect to evidence between public and private statutes. A public statute requires no express proof in courts of justice, every one being presumed to know the law which he is bound to observe; as to them, therefore, the citation of the statute itself is in all cases sufficient. But private acts of parliament are considered as documents relating to individuals, and must therefore be proved by copies compared with the original roll of parliament. A second and inferior species of records is the proceedings of courts of justice, which are proved by exemplifications, sworn copies, and office copies. Exemplifications are transcripts of the records of different courts, accredited by having the seals of such courts attached to them. Sworn copies are transcripts made by individuals who authenticate them upon oath, when they are produced in evidence. Office copies are copies certified to be true and accurate by an officer expressly entrusted for that purpose by an officer of the court to which the records belong. Charters and deeds are proved by the production of the instrument and proof of the execution by the party to be charged with it; but where the document is more than thirty years old, the execution need not be proved. The general rule is that the original deed must be produced, on the principle already alluded to of its being the best evidence; but this is subject to the following exceptions:—1. Where it has been lost or destroyed by accident; 2. Where it is in the possession of a party to a suit against whom it is sought to be produced, and who refuses to produce it: in either of which cases the contents of the document may be proved by a copy, or if no copy exists, by oral testimony. Deeds attested must, in general, be proved by one at least of the subscribing witnesses; but if the attesting witnesses be dead, or are not to be found after a diligent search, or are infamous, or for any other reason incompetent by law to give evidence, the execution of the deed may be proved by proof of the handwriting of the party. The proof of hand-writing, by the law of England, is peculiar. The testimony of persons skilled in hand-writing is wholly excluded, comparison of hands being inadmissible for the purpose. The course is that a witness acquainted with the writing of the individual in question, and who has seen him write, or who has had a written correspondence with him, shall testify to his belief that the document to be proved is in his hand-writing.

From the above summary of the principal rules of evidence existing in the English law, it will be observed that the system is extremely exclusive. Upon the subject of interested witnesses, the law does not merely caution and restrict the amount of credit to be given, but entirely rejects them from being heard wherever a pecuniary interest in the result of the cause, however small, is shown to exist. So also with respect to the reception of secondary and hearsay evidence, it sanctions no degree or kind of testimony at second-hand (except in the cases above enumerated), but excludes it under all varieties of circumstances. That the statement of an interested person is always to be received with caution, often with suspicion, and often with disbelief, may be readily admitted; that it should be always peremptorily rejected as unworthy to be heard is a different and much more questionable proposition. Again, it is true that we ought not to attach so much weight to hearsay evidence as to direct testimony, because it is beyond all doubt that the certainty of obtaining the truth is diminished, and that the means and causes of error are multiplied, in proportion as you remove from the actual observer and add links to the chain of testimony. 'Any testimony,' says Mr. Locke, in his chapter on the Degrees of Assent, 'the further off it is from the being and existence of the thing itself, the less force and proof it has. A credible man vouching his knowledge of it is a good proof; but if another, equally credible, do witness it from his report, the testimony is weaker; and a third that attests the hearsay of an hearsay is yet less considerable. So that, in traditional truths, each remove weakens the force of the proof; and the more hands the tradition has necessarily passed through, the less strength and evidence does it receive from them.' Admitting the justice of this objection to the effect of hearsay evidence, it may still be questioned whether its absolute and unconditional rejection for judicial purposes is justifiable. So also with respect to the mode of proving hand-writing, it might be unsafe wholly to rely upon the evidence of comparison of hands by persons of experience in that occupation, but there seems no good reason why such proof should not be *admissible* in aid of the present vague and unsatisfactory mode of proof by the general belief of a witness.

The most plausible reason for the exclusiveness of the English law of evidence is derived from the nature of the trial by jury, with reference to which it is contended to be safer to withdraw doubtful evidence altogether from their consideration, than to leave it to persons who are often uninstructed, and incapable of drawing correct distinctions upon the subject of testimony to form a proper estimate of its credibility. But this reason is founded upon an assumption not justified by the fact, namely, that the means of

proof actually legalized are infallible guides to truth; whereas, the truth is that many of them are quite as liable to lead to a false conclusion as those which are excluded. In this state of things, therefore, there seems no good reason why all practicable means of attaining to truth, however various in their degrees of effectiveness, should not be committed to juries. This seems indeed to be the growing impression in the profession; the inclination of the courts of late years being to let in as much light to a cause as possible, and to regard objections to evidence rather as matters of *credibility* upon which juries may exercise their judgment, than of *competency* to be wholly withdrawn from their consideration.

In the article EQUITY a reference is made to the present head of EVIDENCE, and we shall accordingly briefly state the manner of ascertaining facts in courts of equity, which differs from the practice in courts of law, where the witnesses are produced and examined orally before the court.

Witnesses in proceedings in equity are examined upon written interrogatories before the examiner of the court or before commissioners in the country, both examiner and commissioners being sworn to secrecy. The answers of the witnesses to these written interrogatories, or their depositions, as they are called, are taken down in writing, and form the only evidence for the plaintiff and defendant (except the defendant's answer, if the plaintiff choose to avail himself of it), which is admitted at the hearing of a cause.* The interrogatories are drawn by counsel, according to the instructions which he receives as to the facts which a witness is considered able to prove; but it frequently happens that the instructions are very defective, and the counsel is obliged to frame his interrogatories as well as he can, in order to elicit the proof of facts favourable to the party for whom he is employed. Though each several interrogatory, when well drawn, is framed for the purpose of establishing some single and distinct fact, written interrogatories cannot from their nature be otherwise than long and somewhat difficult to comprehend. In the oral examination of a witness, it necessarily happens that several questions must be asked consecutively for the purpose of completing the investigation into and the establishment of every important fact to which the examination is directed. Written interrogatories must be framed on the same principle, and therefore every subsequent part of an interrogatory must be framed on the supposition of every previous part being answered in some way; and consequently, it is hardly possible in written interrogatories to avoid what is called making them *leading*, and at the same verbose and cumbrous. These long interrogatories, it is proved by experience, are often imperfectly comprehended by the witnesses, and consequently their evidence is to some intents either incomplete or inaccurate, or both. The interrogatories which either party proposes to his witnesses are not known to the adverse party until the examination of all the witnesses on both sides is concluded, when *publication* is passed, as it is termed, and copies of all the depositions are delivered to the litigating parties under an order of the court.

Under this system, there is of course no cross-examination, in the proper sense of the term; for one party does not know what the witnesses examined by the opposite party have deposed, and cannot therefore effectually examine them, as in a court of common law, where the cross-examination of a witness follows and is founded upon what the witness has stated in his examination in chief. If a party to a suit in chancery will cross-examine a witness who is produced by his adversary for examination, he must examine him on written interrogatories, without knowing what interrogatories have been proposed to him by the opposite party, and without knowing what he has said in his depositions in chief. Such a cross-examination must be in general altogether useless, and often dangerous to the interest of the party making it; unless his object is to ascertain that the witness is an incompetent witness, or unless the witness is one whom he would himself have examined in chief. Under the 32nd Order of the 21st of December, 1833, the last interrogatory before that date commonly in use is in future to be altered as follows: 'Do you know or can you set forth any other matter or thing which may be of benefit or advantage to the parties at issue in this cause, or either of them?' &c. A party however is not bound to insert this interrogatory; and indeed no great harm will result if it is never used. Owing to various causes, such as disinclination on the part of a witness to give himself further trouble, particular affection to one of the litigating parties, or forgetfulness, it might have been anticipated that this general interrogatory would fail in its object; and so far as it has been used, such is said to be the case.

This mode of ascertaining facts in suits in equity is evidently very defective, and has been the subject of considerable complaint and of lengthened inquiry; but hitherto nothing has been done to amend the system.

(See *Minutes of Evidence taken before the Chancery Commissioners, annexed to their Report of* 1826; and a recent pamphlet (1837) by W. A. Garratt, entitled *Suggestions for Reform in Proceedings in Chancery.*)

Those who may be inclined to follow this subject further will find it discussed at great length and with much acuteness in Bentham's *Rationale of Judicial Evidence*. The full development of the English law of evidence is contained in the treatises of Mr. Phillipps and Mr. Starkie.

EVIL EYE. It was an antient superstition that certain persons were endued with the power of injuring those on whom they cast a hostile or envious look. The eyes of such persons were supposed to dart noxious rays on every object on which they were fixed. This power of injuring with the eye was called *Bascania* (Βασκανία) by the Greeks, and *Fascinatio* by the Romans. Several writers who have collected the testimonies of the antients concerning it (as Potter, *Archæologia Græca*, lib. ii. c. xviii., and Alsarius, 'de Fascino,' *Grævii Antiq. Rom.*, tom. xii. p. 885), may be consulted for particulars. Those who enjoyed great prosperity, or met with any extraordinary good fortune, and such as were too much elated by praise and flattery, were more particularly liable to the effects of fascination. Hence when the Romans praised any thing or person, they used to add, *Præfiscini* or *Præfiscine dixerim*, to avert any fascination that might ensue, and to prove that their praise was sincere.

It is remarkable that the same superstition prevails to the present day in several parts of the world, even in the northern part of our island, and in Ireland. In Greece it is at present called *kako mati* (κακο ματι), and its effects are averted by spitting, in the same manner as was practised by the antients against fascination (Theocr., *Idyl.* vi. 39) and ill omens of every kind. In Italy it is called *mal-occhio*, and among the lower orders of people its effects are supposed to be very powerful and fatal. When praise is bestowed on beauty, riches, or any other advantages, the person praised immediately exclaims, 'se mal-occhio non vi fosse,' from an apprehension that the praise may not be sincere, but proceeds solely from a malicious intention to injure. This exclamation is accompanied with a sign of the hand, or by holding up pieces of coral, shells, or various kinds of stones worn as amulets.

The belief in fascination is extremely antient, and in the opinion of some is connected with the story of Medusa and the Gorgons, whose eyes caused immediate destruction. From this source the superstition of the evil eye is probably derived.

Virgil alludes to this superstition in his third Eclogue:—

'Nescio quis teneros oculus mihi fascinat agnos.'

Scot, in his 'Discovery of Witchcraft,' has one or two passages relating to it. He says, p. 35, 'The Irishmen affirm that not only their children, but their cattle are (as they call it) *eye-bitten* when they fall suddenly sick.' It is likewise mentioned in Martin's 'Description of the Western Islands of Scotland,' in Heron's 'Journey,' vol. ii. p. 228, and in several volumes of the 'Statistical Account of Scotland,' as still believed there.

'Nothing,' says Dallaway, in his 'Account of Constantinople,' 4to. Lond. 1797, p. 391, 'can exceed the superstition of the Turks respecting the Evil Eye of an enemy or infidel. Passages from the Koran are painted on the outside of the houses, globes of glass are suspended from the ceilings, and a part of the superfluous caparison of their horses is designed to attract attention, and divert a sinister influence.'

(Millingen's *Observations on an Antique Bas-relief, on which the Evil Eye, or Fascinum, is represented; Archæolog.* vol. xix. p. 70—74: Brand's *Popular Antiquities*, 4to. edit. vol. ii. p. 400—403.)

EVIL, KING'S. [SCROFULA.]

EVILMERODACH. [BABYLON, HISTORY.]

* The execution of written instruments, not wills, may be proved at the hearing by an attesting witness; or where the instrument is not attested, the hand-writing of the party may be so proved also.

EVOLUTE. [INVOLUTE and EVOLUTE.]

EVOLUTION. [INVOLUTION and EVOLUTION.]

EVOLUTIONS, MILITARY, are the movements made by any body of troops either acting by itself or in conjunction with other bodies, for the purpose of arriving at or of retiring from a field of battle, or of placing itself in a position to act offensively or defensively against an enemy.

The circumstances attending the great movements of armies along their lines of communication, and the dispositions of the troops on the field of battle, are developed under the words STRATEGY and TACTICS. The present article will therefore comprehend merely a description of the manner in which the principal evolutions of a battalion of infantry, a regiment of cavalry, and an entire army, are performed; and will conclude with a short account of the movements of light troops in the field.

Evolutions of a Battalion.—When a battalion formed in line has to march in that order towards the front or rear, in order to ensure exactness in the movement three directing serjeants post themselves a little way in front of the centre of the line, and observing some object in the required direction, they advance directly towards it, the battalion following and keeping itself perpendicular to the line of march. While the battalion is thus moving in line, the two flanked companies are wheeled backwards, and made to march in files perpendicularly to the line of the battalion, in order to cover it; and on a halt being ordered, they face towards the enemy.

This order of march can of course only take place where the country is open; when partial obstacles occur, the troops near them necessarily form in file till they have passed them, and afterwards they wheel into the line; but when the obstacles are of great extent, and occur frequently, it is evident that the march of the battalion should be in column.

Columns formed for this purpose are designated columns of companies, of subdivisions, and of sections, according as their breadths, or the extent of their front, is equal to that of a whole, a half, or any portion of a company; and they are said to be at open order, at half, or at quarter distance, according as the intervals between the companies or their divisions are equal to the whole, to one-half, or to one-quarter of the breadth of the column. The order is said to be close when the several divisions are at the distance of one pace only from each other in the length of the column.

The wheel from line into column, and the converse, when the battalion is at a halt, must obviously be performed by causing the divisions to describe a quarter of a circle on their respective pivots. But when a battalion in column is on the march, and it is required to change the route, should the divisions be at the full distances from each other, that is, at intervals equal to the length of a division, it is necessary that the first division, after having described on its pivot an angle equal to that which the new direction is to make with the former, should march forward as soon as the wheeling pivot of the next division has arrived at the like pivot of the first division: the second division then wheels and marches in like manner, and so on. The same rule may be followed when the divisions are at less than full distance, provided the angle which the intended direction of march makes with the former is sufficiently obtuse to allow the divisions to describe the required angle without interfering with one another, otherwise the wheeling must be made by parts; the first division describing a portion of the angle corresponding to the required change of direction, then marching forward a few paces, and completing the wheel, the other divisions doing the same in proportion as they arrive at the ground where the preceding division performed the evolution. The wheelings may be made upon either extremity of a company or subdivision, and they may take place either forward or backward, according to circumstances; occasionally also a company is required to perform a wheel upon its centre, in which case one-half wheels backward, and the other half forward; but in all cases the wheeling pivots are to remain dressed, or in one line.

When a battalion is formed into a column for the purpose of an attack, it is called a column of manœuvre; and when so formed in order to move along a road or through a defile, a column of route. In either case the column may be in open order, at half, or at quarter distance, or in close order; and in the first formation the column of course occupies in length an extent of ground equal to that which it occupies in line, minus the length of the first division. Columns at half, or at quarter distance, or at close order, have the convenience of moving upon less space than the open column, with equal capacity of forming in any manner that may be required for resisting an attack; and their compact order enables them to avoid the evils attending the loss of distances which may occur with an open column, from the inequalities of the ground.

The battalion in line may be formed into a single or double column: the former upon or in rear of either flank company, and the latter upon the two centre companies or the two centre subdivisions. In either case the column is equally fit for its purpose, and the preference of one to the other must depend upon the ground or upon the point to which the movement is to be directed: the single column, however, can always be diminished to the smallest degree, according to the breadth of the defile; whereas the double column, if much diminished, may be in danger of becoming disordered by the intermixture of the files. For an attack, the column formed on the centre of a battalion can be more rapidly brought to bear upon the required point than a column formed on one of the wings, seeing that the divisions in line have but half the distance to march through in order to arrive at their places in the column, and a corresponding advantage is enjoyed when the battalion has to deploy from column into line.

It is to be observed that the front of a column should never be unnecessarily contracted, and battalions should be so instructed as to render it indifferent whether the first or second rank is in front, or whether the right or left flank division (of the line) is at the head of the column; but occasions may occur in which the order of battle is to be reversed, and then the divisions must necessarily change their positions by countermarching.

A battalion in column at open order is formed in line by merely causing the divisions to wheel upon their respective pivots; but a close column of companies, having its head already in the alignement, is deployed by causing the several divisions to move out by files to the right or left parallel to the alignement; each division having got beyond that which was in front of it halts, and then marches up to its place in the line. The deployment may take place upon any one of the companies, which then remains at rest.

Echellon movements are performed when it is required to advance or retreat obliquely, and when a change is to be made in the position of a line, corresponding to a wheel of the whole about some given point: the movements are made to the front when an enemy's flank is to be turned, and to the rear when it is required to cover the flank of the line itself. Echellon movements are the safest that can be adopted by troops in presence of the enemy, as they have the advantage of preserving a general front during the march. A direct echellon, as it is called, may be formed by the different companies or subdivisions marching from their position in the line towards the front or rear, keeping parallel to that position, and halting successively when arrived at the required distances. The oblique echellon is formed by causing the different companies or subdivisions to make a wheel upon their pivots through any angle less than a right angle, but generally not more than one eighth of it; the parallelism of the divisions being ensured by causing a non-commissioned officer of each division to place himself, as the case may require, before or behind some given file, suppose the eighth, from the pivot, and to take a given number of paces on an arc of which that pivot is the centre; the division is then to wheel up to the place where he halts.

An important evolution of a battalion is that of placing itself in a square or oblong form, with the men on the four sides facing outwards, so as to be enabled to resist an enemy who may attempt to surround them. This figure is always formed hollow, or so as to enclose a space in which baggage or treasure may be placed for security; if otherwise, it is evident that great numbers of the men would be useless, since they could not use their fire-arms.

When a battalion in line is to form a hollow square, the manœuvre may take place upon any given company, or upon one formed of the two contiguous subdivisions of two companies, which then for the moment remain at rest; while the other companies break out of the line and march, some to the front and some to the rear of the troops who are stationary, so as to form with them a column of companies at quarter distance. The second division in the

column closes up to the first, and these two form the front of the square; the two rear divisions then face outwards, the last but one closes up to the last, and these two form the rear of the square. The remaining divisions wheel outwards, and constitute the two sides of the square or oblong, which is thus formed four deep. If the square is to resist an attack of cavalry, the two front ranks kneel and slope their firelocks outwards till, at the word of command, they fire a volley: the men in the two standing ranks fire by files, or independently of one another. It is said that Bonaparte, while in Egypt, formed his infantry in squares whose sides were six ranks deep, in order to resist the Mameluke cavalry.

When several battalions form themselves into squares, they dispose themselves either en echellon or in two lines, each square in the first line being at some distance in front of the interval between two squares in the second line; by which means the fire of one square may defend the face of another.

Squares may be reduced to columns, and these to line, by reversing the processes above mentioned. One square consisting of several battalions is not recommended, as much time would be spent in its formation, and the safety of the troops might be endangered should they be attacked while so occupied.

A battalion in column may be obliged to engage in a street or narrow pass where deployment is impossible. In this case, if the column is advancing, the two front companies or divisions fire, the first kneeling and the other standing; after which, on a favourable occasion presenting itself, the whole column moves forward: if the column is to retire, the first division, after firing, faces outwards, half to the right and half to the left; these subdivisions file away to the rear, where they re-load; the second division fires, then files to the rear in like manner, and so on.

Evolutions of a Regiment of Cavalry.—The movements of cavalry on a field of battle, like those of infantry, consist of marches to the front or rear, in line or en echellon; deploying from open or close columns into line, and the converse.

If it be required to form a line for attack from an open column of divisions upon any particular division, those divisions which are in front make a wheel forward equal to three-eighths of a circle, and those which are in rear wheel forward one-eighth; all the divisions being thus parallel to each other, they march in this order up to the alignement on the division which remained stationary, wheeling into it as they arrive. On the contrary, if the column be in retreat, and it be required to form a line on the defensive from an open column of divisions, suppose on the first division of the first or leading squadron, all the divisions are to make a wheel equal to one-eighth of a circle, and in this order march up and wheel into the alignement. It must be observed that the line first formed in these cases is to be at the distance of two horses' length in rear of the intended alignement, in order to allow the officers in front of each squadron to dress the troops, which they can do more correctly than the officers of divisions who are in the line itself.

To deploy in line to the front from a close column of squadrons for an attack, suppose on the second squadron; all the squadrons except this break into divisions by threes, as it is called (that is into divisions consisting of three horses in each of the two lines); the divisions of the first squadron wheel a quarter circle to the right, and march in that order till they get beyond the squadron on which the line is to be formed; the third and fourth squadrons also break into divisions in like manner, wheeling to the left, and marching till they get opposite their respective places in the intended line, which is supposed to be in front of the ground occupied by the first squadron, and into this line all the squadrons now march. But if the line be required to be formed on the rear of the regiment when in retreat, for the purpose of defence, suppose on the fourth squadron, this squadron must then change its front by a countermarch, the others break into divisions, wheel a quarter circle, and march to the left till they come opposite their proper places in the intended alignement, into which they then march as before.

The evolutions are made as above stated when the regiment is in column with its right in front; but it is easy to apply the precepts to the contrary case.

The reason why the squadrons are made to break into divisions by threes is that, since the breadth of three horses is about equal to the length of one, each division of three can wheel within a space equal to that which it occupies in line: the practice however has been objected to on account of the extension of the files which is produced when marching in this order. Movements by the usual divisions or sub-divisions have been preferred on this account, but the former method prevails.

Evolutions of an Army.—The general principles upon which the evolutions of armies, divisions, or brigades are performed, correspond nearly to those of single battalions. When a whole line has to advance parallel to itself, one of the battalions is considered as the regulator, and all the others should conform to its movements. The commander of this battalion must therefore devote his whole attention to the preservation of the direction which has been indicated by the general commanding the army, while the flank officers of the other battalions must endeavour to preserve the regularity of their own battalions by the line of the colours.

Columns of route or manœuvre are formed of any number of battalions, each in column of companies or of sub-divisions, in rear of one another; and if the columns are at close order, the interval between every two battalions is only six paces, or the same as if all the troops were drawn up in line. If the distances of the companies are equal to one quarter of the length of their front, the intervals between the battalions are twelve paces; but when the columns are at open order, the intervals of the battalions should be equal to the breadth of the column, together with the six paces which should be the intervals between the battalions in line. Such columns as the last can instantly be thrown into line by each company making simply a wheel on its proper pivot. When one general column is required to form into what is called a line of columns, the heads of all the columns must be placed in one alignement, but the distances of the several columns from one another in the direction of the line may, according to circumstances, be of any extent, from six paces (in which case the columns are said to be contiguous), to the proper distance for deployment, that is, a distance equal to the length of a column.

A column whose divisions are either at quarter distance from each other, or in close order, can always wheel into a line of columns, because each battalion, in performing the wheel, leaves room for the wheel of that which is in its rear; but a line of contiguous columns, when the depth of each battalion exceeds the extent of its front, cannot for want of room be wheeled into a single column. When such a manœuvre becomes necessary, the line of columns must open out to the right or left far enough to allow the wheel to be performed. When a line of columns is required to be changed into one column, for the purpose of performing a march towards either flank, the most convenient disposition would be that in which all the columns in the line stand with their right wings in front, if it is intended that the march should be towards the right; and the contrary, if it is to be towards the left, for then a simple wheel to the front brings the divisions into the alignement in their proper order.

When a column is on a march, the baggage should be in the rear; or if, on any account, it is placed within the line, it should be, together with the artillery which accompanies the column, in the intervals between brigades, and never between the battalions of a brigade. The preservation of the original extent of a column in front is of importance, and defiling, in order to pass an obstacle, should be avoided if possible, on account of the loss of time which it occasions in fact, it will frequently happen that, on arriving at a stream, a ditch, or a bank, the obstacle will be more conveniently passed by extending than by contracting the front.

Echellon movements of an army are almost always those which are made when in presence of the enemy, the inequalities of ground generally preventing large bodies of troops, if it were otherwise adviseable to do so, from acting against one another in continuous lines. Like the echellon movements of battalions, those of an army may be either direct or oblique: the former are executed by advancing brigades, battalions, or companies parallel to and at unequal distances from their front; and this advance may be made from the centre of the line when it is intended to refuse both wings to an enemy, or from one flank when it

is intended to turn that of the enemy. The direct echellon may also be produced by posting columns in proper situations, ready for deployment, parallel to the enemy's position: the distances between the battalions in echellon should be sufficient to allow them to form squares chequerwise, so as to flank one another.

Oblique echellons of an army are formed by wheeling, and then marching in the new directions so as to gain ground obliquely towards a flank; each of the several bodies performing the manœuvre should not exceed a company, as it might be hazardous to present one flank of a large body towards an enemy in position, and thus expose the line to be enfiladed. And, as the enemy would endeavour to counteract the intended project of outflanking him, should he observe it, advantage ought to be taken of the localities to conceal some of the divisions, and to gain points of support for the bodies placed in advance of the rest of the army. When it is intended to refuse one wing, the battalions of that wing may retreat en echellon as far as necessary, and the artillery of that part of the line which is stationary should be ready to enfilade the enemy on his advance towards the retiring divisions. Movements of attack may be made in columns, which should deploy in line at from 1200 to 1400 paces from the enemy; the destructive effects of an enfilading fire preventing a nearer approach in column.

Generally speaking, the most convenient order for an army, whether on the offensive or defensive, is in column, provided the columns can be covered by the ground from the enemy's artillery; since it may be readily moved up to any given point of attack, while the enemy has few means of judging where that point of attack will be.

Changes in the front of a position, when under fire, are best effected by an echellon march of companies; but when the line is extensive, the battalions which are most remote from the new alignement, and which may be attacked by cavalry during the movement, should be marched up in columns of battalions, the divisions being at quarter distances from one another.

The retreat of a line is accomplished by causing each alternate battalion to retire, perpendicularly to the front, to a certain distance towards the rear, not exceeding 200 yards, that the divisions may be able to support each other by their fires; the remaining battalions protecting the retreat of the others, and then retiring as far as the intervals between the former battalions, who then retreat still further, and so on. The intervals in the lines should be occupied by light infantry; and if the enemy should press closely, the second line of the army, after the first battalions have passed through it, must contribute by its fire to the defence of the intervals in the first line.

This retreat by alternate battalions, or by half-battalions, is indispensable when it is made over a plain; and if the retreat is to be continued, defiles and commanding spots of ground must be occupied and defended as long as possible; by degrees the bodies may diminish their fronts and form themselves into columns of march.

If a gradual retreat of the whole line is not intended, on a flank of the army being attacked, that flank only may be retired in direct echellon by alternate battalions or half-battalions, beginning with that which is at the extremity of the flank attacked; the remaining battalions then retire, still en echellon, thus keeping the menaced flank refused to the enemy, taking care that the distances between the corps are not so great as to render it impossible for them to defend each other by their fire. Each body must repel an attack, if made upon it by infantry, by a counter-attack; if by cavalry, it may dispose itself in a square; or a new line may be formed in the oblique position, if it be thought best thus to resist a general attack of the enemy.

The movements of the second line of an army should correspond exactly to those of the first; the two lines always preserving their parallelism and distance. The second is however frequently kept in a line of columns of battalions, and is made to move in that order even when the first line is deployed.

The most proper stations for cavalry are on the wings of an army, because troops of this class are unfit for resisting an attack; and should they be compelled to retire when placed in the centre, there would be left an interval which the enemy might immediately occupy, and from thence enfilade the wings. This false disposition was made by the French at the battles of Hochstet and Minden, and was the cause of their defeat in those actions. Cavalry are generally employed in the operation of turning a line; and it is evident that this manœuvre must be more readily made from the nearest wing than from the centre.

Manœuvres of Light Troops.—To the light infantry and riflemen, or troops acting as such, are entrusted the guard of the encampments or cantonments. When an army is on the march they reconnoitre the country, repel any parties of the enemy which might get between the columns while advancing; and they check the pursuit of the enemy in a retreat.

When a battalion is employed as light infantry, not more than one-third of the men should actually engage as skirmishers; these extend themselves in line, in two ranks, to the right and left, from some given file, at any distance which may be appointed; or, if no order is given, at the regulated distance of six paces. The rest of the battalion is divided into parties, as supports, of which one is usually in rear of the centre, and another is towards each flank; and when the skirmishers have advanced about one hundred paces to the front, these supports follow them, and are themselves followed by a general reserve. Each of the supporting bodies and the reserve should be kept in compact order; and when the skirmishers retire upon their support, they form in sections in its rear. The skirmishers advance or retire, as the case may be, in one general line, and they should avoid standing exposed if any cover, as that of a hedge, ditch, or copse, can be obtained on the ground: for this reason, when obliged to cross an open plain, their line should make a simultaneous rush towards the spots where they may fire under cover. On open ground, they fire kneeling or lying down, the front rank man discharging his piece first, then retiring in rear of the second rank and loading: as soon as he has loaded he gives the word, ready, in a low voice, when the second rank man fires and loads, care being taken that the muskets of both ranks are not unloaded at the same time.

On the appearance of cavalry the nearest supporters and the reserve move towards the threatened part, and form squares; the skirmishers at the same time run to any cover from whence they may aid the supports by a cross fire.

When light troops have to advance across a bridge, or through a short defile, on arriving at the bank of the river, or at the entrance of the defile, the skirmishers lie down in line and fire; the supports, strengthened by the reserve, charge the enemy on the bridge, or in the defile, drive him back, and then form an extended line as skirmishers, while the former skirmishers pass the bridge or defile, and now constitute the supports and reserve. In retreating the supports pass first over the bridge or through the defile, covered by the skirmishers, and immediately deploy, in order to act as skirmishers themselves; the former skirmishers then rapidly pass, followed by the supports, and the whole form in column in rear of the present skirmishers, who then, by their fire, protect the retreat if it is to be continued.

E'VORA, the principal town of the province of Alentejo, in Portugal, is built upon an eminence in the midst of a fine open country, which produces wine, oil, and corn, and is south-west of the Serra de Osa, which forms part of the range which crosses Alentejo from east to west. Evora is an archbishop's see, has a college, two female houses of education, several good buildings, and a fine aqueduct, attributed to Sertorius, who for a time made this town, then called Ebora, his residence. Julius Cæsar, after his Spanish campaign, made Ebora a municipium, with the name of Liberalitas Julia. There is now at Evora a handsome temple of the Roman period, supposed to have been dedicated to Diana: the front presents an hexastyle of the Corinthian order, the columns remain, and the capitals are of very delicate workmanship, but the entablature is gone, and has been replaced by a rubble work with pinnacles in the Moorish style. (Murphy's *Travels and View of this Temple, with Copies of Roman Inscriptions found at Evora.*) Evora has about 12,000 inhabitants, some manufactures of hats and leather, and a considerable inland trade. It suffered greatly in the French invasion of 1808, for having attempted an insurrection against the invaders; many of the inhabitants were put to death. (Southey's *History of the Peninsular War.*) Evora lies on the road from Lisbon to the Algarve, and is about 80 miles south-east of Lisbon, 30 miles north of Beja, and 50 miles west by south of Badajos

EVREMOND. CHARLES de St. Denys, Seigneur de St. Evremond, was born April 1, 1613, at St. Denys le Guast, near Coutances, in Normandy. He entered the army early, and by his literary talents and sprightly wit, as well as bravery, acquired the friendship of Turenne, Condé, and other of the most distinguished men of that brilliant epoch. Condé made him lieutenant of his guards, for the sake of his society; and he fought with that great commander at the bloody battles of Rocroi and Nordlingen. But the prince, though fond of raillery at the expense of others, could not bear it levelled against himself; and St. Evremond, by an imprudent exercise of his satiric humour, lost his patron and his lieutenancy in 1648. In the wars of the Fronde he espoused the royal cause, and was rewarded with promotion and a pension. He incurred a three months' imprisonment in the Bastile by making too free with Cardinal Mazarin; but found means to reinstate himself in the minister's favour. Another indiscretion in ridiculing the treaty of the Pyrenees (unless, as has been said, there was some secret cause for his disgrace, and this was only a pretext), led to a second order for his arrest in 1661. He received timely notice, and fled, first to Holland, then to England, in which two countries the rest of his long life was spent. Louis XIV., though solicited by his most favourite courtiers to pardon St. Evremond, remained inflexible till 1689, when he granted the exile a tardy permission to return. But it was then too late for St. Evremond again to change the scene; and though in banishment, his life had all that he required for happiness. He was a favourite with Charles II., who gave him a pension of 300*l*., and his society was courted by the most distinguished wits and beauties of that reign; nor was he less fortunate in possessing the regard of William III., who had known him in Holland, and took much pleasure in his company. Devoted to the enjoyment of the present, and availing himself moderately of every source of social pleasure, he retained his faculties, mental and bodily, to the last, and died in his 91st year, September 20th, 1703.

St. Evremond was one of those who, aiming chiefly at success in society, leave no memorials sufficient to sustain the reputation which they have enjoyed in life. He possessed however extensive reading and an independent and acute judgment, as well as wit. His verses are deservedly forgotten; but his treatises on Roman literature and on the modern drama are ranked among his best works. His letters are among the most brilliant specimens of that style of composition in which the French have excelled. He appears to have been a disbeliever in revealed religion, but he was not a scoffer, and he checked wanton insult to religion in others. Neither was he, as has been said, an atheist; but some atheistical books were falsely published under his name long after he was dead. He never derived profit from the sale of his works, nor authorized their being printed; so that the earlier editions, which were all pirated, contain much that was foisted in by the booksellers to profit by his popularity. The first correct edition is that of Des Maizeaux, 3 vols. 4to., Lond., 1705, with a life prefixed, from manuscripts revised by the author and editor jointly, shortly before the death of the former. Des Maizeaux also translated the whole into English. (*Biog. Univ.*; see also Des Maizeaux's *Life* and Grammont's *Memoirs* for scattered notices of St. Evremond.)

EVREUX, a city in France, capital of the department of Eure, on the little river Iton, a feeder of the Eure, 51 miles in a direct line west by north of Paris.

Evreux is mentioned by Ptolemy and by Ammianus Marcellinus, in the Itinerary of Antoninus and in the Theodosian Table. It bore the name of Mediolanum, and was the capital of the Aulerci Eburovices. The name Eburovices was afterwards applied to their chief city, and in the middle ages appears under the corrupted Latin forms of Ebroicæ and Ebroas, from which is derived Evreux. It has been matter of dispute whether the old Mediolanum was on the site of the present city or at a village in the neighbourhood known by the name of Old Evreux; but the remains of a theatre and of several antiquities which have been discovered may be considered as showing that Mediolanum was close to, if not on the site of, the present city. Evreux came into the hands of the Normans, but the duke of Normandie, Richard I., severed it from the duchy and erected it into a distinct county in favour of his second son, from whose descendants it afterwards passed to the house of Montfort. In the beginning of the twelfth century (in 1119) it was burned by Henry I. king of England; and toward the close of the same century (in 1194 and 1199) it was twice destroyed by Philippe Auguste, king of France, who shortly afterwards acquired permanent possession of it. The county of Evreux was bestowed as an apanage on a branch of the royal family of France, which subsequently acquired the throne of Navarre; but on the death of Charles le Mauvais, king of Navarre, it reverted to the French crown. In the wars of the English in France, under Henry V. and VI., Evreux was repeatedly taken and retaken: the last time was in 1441, when it was captured, after a vigorous resistance, by the French, from whose hands it has never since passed away.

A great proportion of the inhabitants (who in 1832 were 7988 for the town, or 9963 for the whole commune) are persons of independent property. The houses are for the most part built of wood and clay or plaster. The streets are broad and beautifully neat. The city stands in the midst of gardens and orchards in a fertile valley watered by the Iton, which divides into two branches before reaching the town, and flowing on each side, under or near the walls, and afterwards reuniting, renders the position of the city insular Part of the waters of the Iton are conducted through the city by means of a canal.

The principal edifice is the cathedral, which was rebuilt by Henry I. of England, after he had burned the former one with the rest of the town: the nave alone retains any vestiges of early architecture: its massy piers and semicircular arches are evidently of Norman origin, and are probably part of the church erected by Henry. All the rest is comparatively modern. The interior is adorned with some elegant carving, both in stone and wood: there are some good specimens of painted glass.

The church of St. Taurinus (formerly attached to the Benedictine abbey of St Taurinus, founded in the seventh century) contains some valuable specimens of Norman architecture: the interior has been modernized. A portion of the monastic buildings serves as a seminary for the Catholic priesthood. The church of St. Gilles, now converted into a stable, presents some antient features worthy of notice.

Among the other remarkable buildings are the episcopal palace, the hospital, a fine new building, the office of the prefect, formerly the hospital, and the prisons. There are some handsome public walks.

The manufactures of Evreux are woollen cloth, woollen and cotton yarn, bed-ticking, calico, cotton velvet, hosiery, leather, paper, wind musical instruments (flutes, clarinets, &c.), and ivory and box-wood combs. Trade is carried on in these articles, and in grain, brandy, cider, perry, and linseed oil. There are seven annual fairs; the most important, that of St. Taurin, lasts eight days. There are a subordinate court of justice, 'une chambre consultative des arts et manufactures;' a central society of agriculture, sciences, arts, medicine, surgery, and pharmacy; a high school; a public library of 6000 volumes; and a botanic garden, at which courses of lectures on botany are delivered.

In the neighbourhood of Evreux, about a mile and a half from the town, is the Château de Navarre. Jeanne, daughter of Louis Hutin, king of France and Navarre, in which latter kingdom she succeeded her father, married the then count of Evreux, and built a château, which she called the Château de Navarre: this structure was, in 1686, levelled to the ground by its possessor, the duke of Bouillon, who erected the present building. Upon the emigration of his descendants, it became national property, and was given by Napoléon to the Empress Josephine, who resided here for a time. The house, which is of stone, is formal and ill proportioned; but the woods around are beautiful, the avenue noble, and the sheets of water extensive. The château is now deserted. Old Evreux appears to have been the site of a Norman and previously that of a Roman fortress. There are some remains of a Roman aqueduct and Roman medals in gold, silver, and bronze have been dug up.

The arrondissement of Evreux contains 11 cantons or districts under the charge of a justice of the peace; two of these are in the town of Evreux. It comprehends 287 communes, and had, in 1832, 118,397 inhabitants. The diocese comprehends the department of Eure: the bishop is a suffragan of the archbishop of Rouen. The foundation of the see is ascribed to the third century. (Dawson Turner, *Tour in Normandy*; Dulaure, *Histoire des Environs de Paris*; *Dictionnaire Géographique Universel*, &c.)

EX. [DEVONSHIRE.]

EXAMINATION. [EVIDENCE.]

EXANTHEMATA (*Exanthematous diseases*), ἐξάνθημα, an *efflorescence;* a term under which are comprehended the eruptive fevers, or the diseases commonly termed rashes. Rashes are superficial red patches, variously figured, and diffused irregularly over the body, leaving interstices of a natural colour, and terminating in cuticular exfoliations. Fever is an essential element in the definition of an exanthematous disease, as this term is usually employed by nosologists; but the writers on cutaneous diseases give to it a modified signification, and comprehend under it only those diseases which are properly termed rashes, whether those rashes are attended with fever, and whether they are contagious or not. Thus Dr. Bateman comprehends under the order Exanthemata measles, scarlet fever, nettle-rash, roseola or the rose, purpura, and erythema.

EXARCH was the title of the governor of Italy under the Byzantine emperors, established by Justinian after the reconquest of Italy from the Goths in the sixth century. The first exarch appointed was Longinus, A.D. 568. The residence of the exarch was at Ravenna, then a sea-port town, and the great entrepôt between Greece and Italy. The exarchs, who were generally chosen among the officers and favourites of the Byzantine court, were of course removable at the pleasure of the emperor, but several of them remained in their office to the end of their lives. Their administration was often marked by acts of oppression and treachery, the results of Byzantine corruption as well as of the peculiar difficulties of their situation. They were engaged in frequent hostilities against the Longobards who had invaded the greater part of Italy, and were also not unfrequently at variance with the popes, and their authority was often confined within the walls of Ravenna. At last, in the year 752, Ravenna being taken by Astulf or Astolphus, king of the Longobards, the exarchate, as well as all dominion of the Byzantines over North Italy, was at an end; but the Greek emperors still retained possession of parts of Apulia and Calabria, where Bari became the residence of the catapan or Byzantine governor. (See *Chronological Series of the Exarchs* in Petau, *Rationarium Temporum.*)

EXCAVATIONS. [FOUNDATIONS.]

EXCENTRIC. [PTOLEMAIC HYPOTHESIS.]

EXCENTRICITY, a term applied to the ratio which the distance between the centre and focus of an ellipse or hyperbola bears to the whole semiaxis. [ELLIPSE; HYPERBOLA.] With regard to this word, it should be noted that in the older writings on conic sections it was not the *ratio* of these two lines, but the former of them, namely the distance between the centre and focus, which was called the eccentricity.

Let a be the semimajor axis of an ellipse or hyperbola, b the semiminor axis, and e the eccentricity; then

$$\text{in the ellipse } e^2 = 1 - \frac{b^2}{a^2}$$

$$\text{in the hyperbola } e^2 = 1 + \frac{b^2}{a^2}$$

EXCESS. For a peculiar mathematical use of this term, namely, the *spherical* excess, see SPHERICAL TRIANGLE.

EXCHANGE. The term exchange is commonly employed by merchants to designate—first, the written instrument by which the debts of persons residing in different countries or in different parts of the same country are brought to a condition for final liquidation; and, second, the varying price of such negotiable instruments in the market.

The first division of the subject is discussed under the title BILL OF EXCHANGE; the following article will comprise the second, and will include an investigation of the principles on which exchange transactions are based.

International, or, as it is commonly called, foreign trade, arises out of the unequal or exclusive capacity of different countries to produce the various objects of desire. One country, for instance, has abundance of coal and iron; another enjoys a climate especially adapted to the culture of the vine; whilst a third possesses some peculiar advantages for the growth of wheat. If interchange were not restricted by legislative enactments, if trade were perfectly free, the first country would supply the other two with iron wares, taking from the second wines, and from the third wheat; whilst the two last would in like manner exchange their respective productions with each other.

Peculiarities of soil and climate, abundance and cheapness of land or of labour, the exclusive presence of certain animals, vegetables, or minerals, all give rise to interchange between nation and nation. Every country has some peculiarity which gives it an advantage with respect to that peculiarity over all other countries: it is by means of interchange that such advantages are shared equally among all.

In the article BILL OF EXCHANGE, already referred to, we have explained how this mode of settling accounts between parties in different countries arose; and the various legal rights of the parties to a bill of exchange are also in that article fully explained.

In investigating that part of the subject which belongs to the present article it is necessary to bear in mind that different countries make use of different coins—different in denomination, in weight, and consequently in value. The pound, for instance, is the money of England, the franc that of France, the dollar that of America. These several coins contain very different quantities of the precious metals. The dollar, for instance, contains about five times as much silver as the franc, whilst the guilder contains only twice as much. The value of a currency depends on the quantity of pure metal contained in the coin which forms its legal tender, alloy being left wholly out of the account.

In the language made use of by merchants, the existence of a *par of exchange* is usually assumed. Between two countries making use of the same metal a par may exist; but between two countries one of which makes use of gold and the other of silver an invariable par cannot exist.

The following is a statement of the contents, in pure silver, of the several coins forming the money of account of the several countries specified:—

	Grains.
Franc of France . . .	69·4
Mark of Hamburg . .	105·15
Florin of Amsterdam . .	146·8
Dollar of America . .	370·1

Hence the mark is worth, in Paris, 1·515 francs; in Amsterdam, 14 stivers 5 pfennings; and in New York, 28·2 cents.

Gold is now a legal tender in America, and the sovereign is by law worth 4·87 dollars, making the eagle of 10 dollars worth 2*l.* 1*s.* 0¾*d.*; the dollar (of gold), 4*s.* 1¼*d.*; and the 100*l.* sterling equal to 487 dollars; all of which are different expressions for the *par* between England and the United States—both being gold-using countries.

We have said that a par of exchange cannot exist between two countries making use of different metals as the standard of their respective currencies; we shall now explain the reason. Gold is the standard in England. The silver coin of England possesses a conventional value independent of the market value, and the latter may fluctuate without affecting the former. Foreign coins, the franc or the guilder for instance, possess no such conventional value. They are merely a commodity liable to fluctuation with the varying price of silver.

Within the last ten years the price of silver in the London market has varied from 4*s.* 10½*d.* to 5*s.* 1*d.* per ounce of 444 grains pure, the medium price being 4*s.* 11¾*d.* to 5*s.* The extreme prices give the following results:—

Price of Silver per oz.	Value of Franc.	Value of £1.
s. *d.*	*d.*	*f.*
4 10½	9¼	26·30
5 1	9·54	25·15

Thus making a fluctuation in the so-called par of exchange of rather more than 4½ per cent.

The assumption of a par of exchange where no par can exist is likely to lead at times to great inconvenience. Suppose, for instance, that the par between Paris and London be assumed at 25·58fr., which is about the medium. Suppose further that exchange is quoted at 26·30fr.; what would be the inference? Why that exchange was 2·8 per cent. in favour of England, and (the cost of transmission being much less than the above difference) that consequently bullion was about to pour into London. But sup-

pose that at the same time the market price of silver had declined in London to 4*s.* 10½*d.* per ounce, and gold in Paris had advanced in a like ratio, what would be the effect? Why the supposed premium in favour of England would vanish, and the par, for the time being, would be brought to coincide with the actual rate.

Though there exists no invariable par of exchange, it is extremely useful to the merchant to know the average value of the currency of every country with which he trades, in order to ascertain what may be called the *approximate par*, which must be the pivot around which fluctuations will necessarily turn. This approximate par (a term which we make use of for the sake of conforming, as nearly as truth will permit, to the language familiar to merchants) should be grounded on the average value of a currency taken on a period sufficiently long to include fluctuations from highest to lowest. To the approximate par so taken will be the tendency of the rate of exchange to conform.

The approximate par of exchange will be liable to be affected by four pairs of circumstances, in addition to a rise and fall in the price of the precious metals. These are—

1. Changes made by the supreme authority in the quantity of the pure metal contained in the coin by way of increase or diminution.
2. Depreciation from the use of paper money, and restoration.
3. Clipping, and restoration.
4. Wear and tear, and restoration.

1. *Legal Changes in the Coinage.* Governments have not unfrequently found the diminution of the quantity of the metal contained in the current coin an easy way of getting rid of improvidently contracted debts. The English pound was once a troy pound of silver; it is now about four ounces. The French livre, once probably the same quantity, is now less than a *seventieth* part of a lb. By what a succession of frauds must this change have been brought about!

A government having borrowed *so many pounds* of its subjects would find it a very convenient thing, when the day of payment should come round, to call ten or fifteen shillings 'a pound;' and as it would have all the debtors in the kingdom on its side, popularity would be divided on the measure. But although creditors at home may be compelled to submit to this robbery, creditors abroad cannot. Their contract is to receive a given sum of the money of their own country, and the only effect of any debasement will be that the foreign debt will require more of the debased money to liquidate it; in other words, exchange will fall in the ratio of the debasement. Thus suppose the sovereign to be reduced in weight 10 per cent., exchange on the Parisian Bourse, if at 25·58f., would fall to 23f. 2c. If, on the other hand, the franc were reduced, exchange would rise.

We can illustrate this by two historical facts. Formerly the Spanish dollar contained as much silver as 4*s.* 6*d.* sterling, and consequently the average value of 100*l.* was 444 dollars 44 cents. The weight of the dollar however has been since reduced, and it now contains only as much silver as 4*s.* 2*d.* sterling, so that that the average value of 100*l.* sterling is now 480 dollars; the difference being 8 per cent. The old language of quotation however has never been wholly abandoned by the American merchants. They still assume the old par, so that when exchange is quoted at 10 or 11 per cent. premium—a premium which, as we shall presently see, could not be maintained for an hour—it is in fact at 2 or 3 per cent. only (the remaining 8 per cent. being nominal); and when it is quoted at 6 or 7 per cent. premium, it is in fact at 1 or 2 discount. The other fact to which we allude is the recent adoption of a gold standard in the United States, at a rate, compared with silver, to render the American currency practically debased.

Before the introduction of the Gold Bill the average value of 100*l.* sterling, as we have seen, was 480 dollars; by the new standard, the quantity of gold contained in 100*l.* is now coined into 487 dollars, being a difference of 1·45 or nearly 1¼ per cent. Thus the par between England and America is now 487 d. = 100*l.*, or adhering to the old (erroneously assumed) par, a nominal premium of 9·45 per cent.

2. *Paper Money.* One of the evils to which paper money is liable is depreciation from excess. The market price of money, like that of every thing else, varies in the inverse ratio of its quantity. If it be scarce it will be dear; in other words, all other things will be cheap. If, on the other hand, money be in excess, it will be cheap; in other words, much of it will be given in exchange for other things. To say that prices are advancing, is equivalent to saying that money is getting cheaper and cheaper. The effect of issuing paper money in excess is, then, to make money, both metallic and paper, cheap. Being cheap, it becomes desirable to export it; but paper money is not available for this purpose, and hence metallic money is alone exported. Bullion in the uncoined state would, under such circumstances, advance in price, but the sovereign would be still a sovereign; hence there would exist a motive to convert coined money into bullion, or to export it. Bullion however would not be exported, except when it was really cheaper than in other countries.

During the Bank restriction the depreciation reached 27·9 per cent. Gold was then worth 5*l.* 8*s.* per ounce, and silver 6*s.* 11*d.* estimated in paper money. But at these nominally high prices the proportion between gold and silver was precisely the present average proportion, namely, 1 to 15·52; or, gold at 3*l.* 17*s.* 10½*d.*, and silver at 4*s.* 11¼*d.* The Parisian par was then 18·43 f. per 1*l.* sterling (instead of 25·58 f.), so that although *coin* might be sent away as a cheaper mode of conversion than melting, bullion would not necessarily be an article of export, unless when exchange was really, and not merely nominally, against us.

We have seen that the present average value of the dollar is 4*s.* 2*d.*; when silver was at 6*s.* 11*d.* the value would be 5*s.* 9¼*d.* in the depreciated English money. Hence a debt in London of 100*l.* could be discharged with 346 dollars 18 cents, whereas now it would require 480 dollars. The dollars remained unchanged, but 100*l.* of 1813 was worth only 72*l.* 2*s.* in gold.

As the par of 4*s.* 6*d.* was then, as now, retained, the depreciation was met by a heavy nominal discount of 27$\frac{9}{10}$ per cent. It is unnecessary to pursue these calculations to other countries: the same principles apply to all countries.

It is scarcely necessary to observe, that in the process of restoration the phenomena are reversed. A restoration of the English currency, for instance, would be similar in its effects to a depreciation of the currencies of all other countries.

3. *Clipping the Coin.* In some countries the practice of clipping the coin still continues, and it is likely to continue just so long as people will take clipped coin. If people would take shillings clipped into polygons, they would be so clipped in less than twenty-four hours.

The effect of clipping on the exchange is precisely similar to the two cases we have already examined. If the silver coin of France were clipped to the extent of one-tenth of its weight, exchange would be affected to that extent. Instead of requiring only 25·58 f. to purchase 1*l.* sterling on the Parisian Bourse, it would require 28·14 f. Restoration would be equivalent to clipping the coins of other countries.

Some of the continental states in which clipped coin circulates have adopted an expedient to keep up the character of their money of account. This expedient is to transact all their dealings with other nations in what they call *Banco*, which may be defined money *as it ought to be*, to distinguish it from the current or clipped money, which may be called *money as it is.* The merchants keep their bank accounts in *money as it ought to be*, paying in the clipped money, or *money as it is.* They are charged with the depreciation, which is known by the term *Agio.* This is purely an arrangement of convenience.

4. *Wear of Coin.* The case of a worn coinage is precisely similar to that of a clipped coinage, except that the latter is sudden in its effects, the former gradual. Hence depreciation from wear is much more likely to deceive than that which arises from clipping. Restoration by means of a new issue reverses all the effects.

We have now enumerated the principal circumstances affecting the value of a currency. Fluctuations in the rate of exchange proceeding from an alteration of the value of the medium in which price is quoted are purely *nominal;* and so they are usually designated. They are alterations proceeding from the altered quantity of the article purchased, and are analogous to an alteration of the price of wheat from an alteration in the capacity of the imperial quarter.

What is usually called the *real* exchange is the actual market-price, determined by the same law as the price of

sugar, corn, or broad-cloth: namely, the existing proportion between supply and demand.

The demand for bills of exchange arises out of the necessity of paying for importations. The supply arises out of the practice of drawing for the amount of exportations. If the supply and demand be equal—if for every pound's worth of goods imported there be exactly a pound's worth of exported goods to be drawn for—there will be no real exchange: that is, the real exchange, however much the nominal exchange may alter, will be at par.

When, however, the importations are not precisely equal to the exportations, exchange can no longer remain at par. An excess of importation would cause exchange to advance against the importing country. Let us suppose a case. Let us suppose that an actual or anticipated advance in the price of wheat causes the transmission of extensive orders to the north of Europe. This would produce a sudden demand for bills of exchange—not perhaps to the extent of the orders; for in all probability goods adapted to the markets of the wheat-growing countries would be sent in part payment—but, at all events, to a considerable amount. There would accordingly be an advance in the rate of exchange, first on the wheat-shipping ports, and next on all other countries. Thus, England imports wheat from Danzig, and exchange on Danzig rises. But exchange on Amsterdam is at par, as it is also at Amsterdam on Danzig. Hence the wheat-importer would buy a bill on Amsterdam, and with the proceeds would there buy a bill on Danzig. But the buyer of exchange on Amsterdam cannot go into the market without causing an advance in the rate. In this way the advance becomes general.

The real exchange, however, is subject to a limit beyond which it cannot advance. This limit is the cost of transmitting the precious metals. A debtor to a foreign country—say the importer of wheat—can liquidate his debt by the transmission of bullion as well as of a bill of exchange; and he will be determined in his choice by the comparative cheapness of either mode. The cost of transmitting specie is, let us assume, 2 per cent.: so long as exchange continues below 2 per cent. the debtor will continue to purchase it; but the moment the drawer demands more than that rate, the exportation of bullion will be resorted to, and bills of exchange will cease to be demanded. The cost of transmitting bullion, including the cost of collecting it at the port of shipment, is therefore the limit beyond which the real exchange cannot advance.

But an advance in the rate of exchange, even up to this point, cannot long be maintained. The tendency in an advance in the rate is to check importation and stimulate exportation. Articles which would only just pay with exchange at par would pay a profit sufficient to induce exportation where the exporter could secure 1 or 2 per cent. more for his draft. Thus, by the stimulus to exportation, the supply of bills would be increased to meet the demand, and *pro tanto* to check the advancing rate of exchange. On the other hand, an imported article which was only just paying when exchange was at par would cease to pay when it should cost the importer 2 per cent. more to make his remittance. Thus, whilst the cost of exporting the precious metals is the immediate check upon an advancing rate of exchange, the effect of the real exchange in stimulating or checking importation or exportation, as the case may be, is to work its own remedy. The real exchange is, in fact, continually gravitating towards par, though at times superior forces may overcome that perpetual tendency.

Most of the errors which prevail in relation to the subject of exchange arise out of confounding the real with the nominal exchange. For the purposes of general reasoning, it is well to know what is the average value of the currencies of the several nations with which we have commercial relations; but for practical purposes the actual par for the moment should be rigidly calculated. Unless this be done, the practical merchant will be liable to continual error. For farther information on the subject, the reader may consult Mill's *Elements of Political Economy*, chap. iii., sec. 16, p. 182; Ricardo's *Principles*, chap. vii., *On Foreign Trade;* article *Exchange* in the *Encyclopædia Britannica;* and Tooke's *High and Low Prices*, passim.

EXCHANGE, ROYAL. [GRESHAM.]

EXCHEQUER COURT is a superior court of record established by William the Conqueror as part of the Aula Regis, and reduced to its present order by Edward I.

It is the lowest in rank of the four great courts which sit at Westminster Hall, although in ancient times one of the first in importance, as all causes relating to the rights of the crown were there heard and determined, and the revenues of the crown were supposed to be received there. Perhaps the inferiority in point of precedence of this court may be attributed to its having been originally erected solely for the king's profit, which was considered an object inferior to the general administration of justice to the subject.

Etymologists have exhausted much research in ascertaining the origin of the name: some assert that it is derived from the old French word *Eschequier*, a kind of abacus or table; or the German, *Schatz*, 'treasure.' The Latinized form of the word is *Scaccarium*. Camden says it was so called from the covering of the table at which the barons sat being party-coloured or *chequered*, and on which, when certain of the king's accounts were made up, the sums were marked and scored with counters.

The judges of the court of exchequer are the chancellor of the exchequer for the time being, the chief baron, and four other barons, who are created by letters patent, and are so called from their having been formerly chosen from such as were barons of the kingdom, or parliamentary barons. (Selden's *Titles of Honour*.)

The court of exchequer was formerly held in the king's palace. Its treasury was the great deposit of records from the other courts; writs of summons to assemble the parliaments were issued by its officers; and its acts and decrees, as they related almost entirely to matters connected with the king's revenue, were not controlled by any other of the king's ordinary courts of justice.

It now consists of two divisions, one of which exercises jurisdiction in all cases relating to the customs and excise, and over revenue matters generally. The other division is subdivided into a court of common law, in which all personal actions may be brought, and a court of equity, where suits in equity may be commenced and prosecuted.

A plaintiff, when bringing an action in this court, previously to the Act for Uniformity of Process in personal actions (2 Will. IV. cap. 39), fictitiously alleged himself to be the king's debtor, in order to give the court jurisdiction in the cause; but since the passing of that act it is no longer necessary to resort to this fiction in order to bring an action on the plea side of the court of exchequer, as that statute assimilates the practice of all the common law courts, and the operation as well as the name of the processes issued from them are the same.

The number of officers on the plea side of the court of exchequer, and their several duties, are regulated by the 2nd and 3rd Will. IV. cap. 110. By 3rd and 4th Will. IV. cap. 70, a great number of old offices are abolished.

When the court sits in equity the chancellor of the exchequer has a voice (although now very rarely exercised) in giving judgment. The last case in which the chancellor was required to sit, owing to the barons being equally divided in opinion, was that of Naish against the East India Company, Michaelmas Term, 1735, when Sir Robert Walpole was chancellor, and his decision in a question of very considerable difficulty was said to have given great satisfaction.

An appeal lies from this court by writ of error to the justices of the courts of king's bench and common pleas sitting in the exchequer chamber, who alone have power to review the judgments of the barons; and from their decision a further appeal may be brought before the house of lords.

The Court of Exchequer chamber was first erected in England by stat. 31 Edward III., to determine causes upon writs of error from the common law side of the court of exchequer. The judges of the three superior courts occasionally sit here to hear arguments in important criminal cases, and upon causes of great weight and difficulty, in which the judges of the court below have not given their judgment.

As a court of error, the court of exchequer chamber underwent considerable alterations by the passing of the 11th Geo. IV. and 1st Will. IV. cap. 70., and its constitution is now regulated by that statute. [COURTS.]

The Court of Exchequer in Scotland was established by the 6th Ann, cap. 26. The judges are the high treasurer of Great Britain, with a chief baron, and four other barons.

By a recent act (3 and 4 William IV. c. 13) the powers

of the barons of the Scotch Exchequer as to the duties and revenues, &c., mentioned in the act have ceased, and are vested in the Commissioners of the Treasury; and the collection and management of the assessed taxes and land-tax of Scotland are transferred to the Commissioners for the Affairs of Taxes, but the judicial powers of the barons are specially saved.

The Court of Exchequer in Ireland was established by the 40th Geo. III. cap. 39, and consists of the chief justices, chief baron, and the rest of the justices and barons, or any nine of them.

EXCHEQUER BILLS form the principal part of the unfunded public debt of this country. These bills are issued under the authority of parliament for sums varying from 100*l.* to 1000*l.*, and bear interest. They were first issued in the reign of William III.; and although their amount has since varied greatly at different times, the convenience which they afford to individuals and their advantage to the public have been such as to cause their constant issue. Their convenience to individuals arises from the circumstance of their passing from hand to hand without the necessity of making a formal transfer, of their bearing interest, and of their not being subject to such violent fluctuations as sometimes occur in the prices of the funded debt. This comparative steadiness in value is caused by the option periodically given to the holders to be paid their amount at par, or to exchange them for new bills to which the same advantage is extended; besides this, when a certain limited period has elapsed from the date of their first issue, they may be paid to the government at par in discharge of duties and taxes. The amount of premium that may have been paid at the time of purchase is consequently all that the holder of an exchequer bill risks in return for the interest which accrues during the time that it remains in his possession. The advantage to the public consists in the lower rate of interest which they carry compared with the permanent or funded debt of the nation, to which, however, they must in this respect bear some certain proportion. When the price of the public funds is high, the interest upon exchequer bills will be low; and if, through any public or commercial derangement, the funds should fall in price so as to afford a much more profitable investment than exchequer bills, the rate of interest upon these must be raised in order to prevent their payment into the exchequer in discharge of duties: a thing which would embarrass the financial operations of government. When first issued in the reign of William III., the interest borne by exchequer bills was 5*d.* per 100*l.* per diem, being at the rate of 7*l.* 12*s.* 1*d.* per cent. per annum. In the same reign the interest was afterwards lowered to 4*d.* per 100*l.* per diem, or 6*l.* 1*s.* 8*d.* per cent. per annum; and in the following reign the rate was still farther reduced to 2*d.* per diem, or 3*l.* 0*s.* 10*d.* per cent. per annum. During the greater part of the war from 1793 to 1814, the rate of interest upon these securities was fixed at 3½*d.* per cent. per diem, or 5*l.* 6*s.* 5½*d.* per cent. per annum. Since the last-mentioned year the rate has been progressively reduced to 2½*d.*, 2*d.*, and 1½*d.* per 100*l.* per diem, at which latter rate they were in the market at the time of the derangement of the currency which was experienced in the beginning of 1837. Under these circumstances, it was considered important as far as possible to relieve the Bank of England, by which establishment a very large proportion of these securities were then held, and to place it in the most favourable position for affording relief to the commercial classes; and accordingly the rate of interest upon exchequer bills was raised to 2¼*d.* per cent. per diem, at which rate they are still current (August, 1837), although the high premium which they bear in the market—48*s.* per cent.—leads to the supposition that it will be soon again reduced.

In periods of commercial pressure, arising from causes which are believed to be temporary, it has sometimes been considered advisable by parliament to make advances to merchants upon the security of goods; these advances have been made by the issue of exchequer bills, which have been cancelled when the exigency that called for them has passed away. A more permanent occasion for their issue, apart from the immediate wants of the government, has been the desire of aiding individuals or private associations in the prosecution of works of public utility, such as canals, roads, &c. In these cases the rate of interest charged to the borrowers is somewhat greater than that borne by the bills, and the difference has been applied to defray the expense of management on the part of the public.

The amount of exchequer bills 'outstanding and unprovided for' at the end of each of the last ten years was as follows:—

	£.		£.
1827	27,546,850	1832	25,696,000
1828	27,657,000	1833	28,384,700
1829	25,490,550	1834	28,521,550
1830	25,609,650	1835	29,007,950
1831	25,551,350	1836	28,155,150

EXCISE DUTIES, the name given to taxes or duties levied upon articles of consumption which are produced within the kingdom. This description, which has usually been given of excise duties, is more strictly applicable now than it was formerly, when the commissioners of excise revenue were also charged with the collection of duties upon various articles imported from foreign countries. Among these foreign articles were wine, spirits, tobacco, glass, and tea. The last named of these was the last that was withdrawn from the management of the Excise and transferred to the Board of Customs. There are still, it is true, certain duties to which the name of excise is applied which can hardly be called duties upon consumption, although they are accessary to it, such as the duty on sales by auction and the sums charged for licenses to permit parties to carry on certain trades.

Excise duties are said to have had their origin in this country in the reign of Charles I., when a tax was laid upon beer, cider, and perry, of home production. The act by which these duties were authorised was passed by the long parliament in 1643. This act contains also a list of foreign articles, and among others tobacco, wine, raisins, currants, and loaf sugar, upon which excise duties were imposed in addition to duties of customs already chargeable. This act was adopted and enforced under the protectorate of Oliver Cromwell; and by the statute 12 Charles II. c. 24, the duties of excise were granted as a part of the revenue of the crown.

For a long time this class of duties was viewed with particular dislike by the people, on account of its inquisitorial interference with various industrial pursuits, and it certainly forms a very strong ground of objection against excise duties, that the security of the revenue which they yield is held to be incompatible with the perfect freedom of the manufacturer as to the processes which he may apply in his works. In every highly-taxed country where consumption duties form part of the public revenue it would seem however to be hardly possible to avoid the adoption of this class of duties. If, taking for our example an instance which is now exercising an injurious effect in a neighbouring country, it is found expedient to impose a customs' duty upon the consumption of foreign-made sugar, it is clearly necessary for the protection of the revenue that an excise duty should be imposed upon sugar of domestic production, otherwise the community at large is made to bear the load twice, once in the form of some other tax, and again to the producer of indigenous sugar, who will charge the consumer nearly as much as he would pay to the importer of foreign sugar, including the amount of the duty. By such means a branch of industry would be fostered, unprofitable to the country at large, and profitable only to the few persons by whom the indigenous sugar is produced, but whose profits will not long continue greater than the usual profits upon the employment of stock obtainable in the same country from other branches of industry. An attempt has been lately made to set up a beet-root sugar manufactory in England but parliament having imposed an excise duty upon the produce equal to the customs duty charged upon colonial sugar, it does not appear probable that the attempt can be successful, or indeed that it can be persevered in, which indeed is little to be regretted, for the reason already assigned.

Excise duties are liable to this among other very serious objections, that the regulations under which they are collected are made, perhaps unavoidably, to interfere with processes of manufacture, so as to prevent the adoption of improvements which would be beneficial first to the manufacturer and afterwards to the community at large, which must always be interested in their adoption, because of the greater excellence or cheapness of the products which it is the object of the experimenter to attain. It will give some idea of the

extent to which this interference is injurious, if we state, on the authority of a gentleman conversant with all the details of the art of calico-printing, that upon the same premises, with the same capital, and employing the same amount of labour, double the quantity of cloths are now printed which could have been printed previous to the repeal of the duty, and to the consequent withdrawal of the excise-officers from the works. Another great objection that may be urged against excise duties is, the facilities which they offer for the commission of frauds against the revenue, an offence which, in the eyes of many persons, is of a venial kind, but which too often ultimately demoralizes those by whom it is committed. In the Seventeenth Report of the Commissioners appointed to inquire into the management and collection of the excise revenue it is stated as a striking proof of the extent to which frauds are committed by manufacturers of soap, that 'there are in England fifty that take out licenses, for which they pay 4*l.* per annum, each of which makes, or rather brings to charge, less than one ton of soap per annum, from which it is obvious that as the profits of such a sale would not pay for the license, the entry is made in order to cover smuggling.' With regard to malt, another article of great consumption which is subject to excise duties, the commissioners state it to be their opinion, founded upon the evidence given by several respectable maltsters, 'that malt is sold throughout the season, and in large quantities, for a price that is insufficient to pay the expense of making it and duty; and that the duty is evaded to a great amount.' A strong presumptive evidence to this effect is contained in the fact that the average number of bushels of malt brought to charge in each of the ten years from 1725 to 1734 was 26,177,330, while in the ten years from 1825 to 1834, that is, after the lapse of a century, the number of bushels so brought to charge was 29,572,380; although during that time the population had been more than doubled, and the habits of the people not altered in any way that should lead to the supposition of any decreased consumption of the products of malt.

The articles now subject to excise duty are:—auctions; bricks; glass; hops; licenses; malt; paper; soap; spirits (British); vinegar.

In addition to the foregoing, excise duties were collected in 1797, under the following nineteen heads, viz.; * starch; * stone bottles; * sweets and mead; tea; * tiles; * candles; * coaches; cocoa; coffee; * cider; * perry; * hides and skins; pepper; * printed goods; * salt; spirits (foreign); tobacco and snuff; wine; * wire.

Of these nineteen articles the duties have been repealed upon the twelve to which an asterisk is prefixed; the collection of duties on the remaining seven articles has been transferred to the Customs department.

The following table states the amount of payments made into the Exchequer on account of excise duties in England, the charges of collection and the rate per cent. on the collection calculated on the gross revenue in each year from 1797 to 1835.

	Net Receipt. £	Charges of Collection. £	Rate per cent. £	s.	d.
1797	9,452,887	411,696	3	14	4¼
1798	9,872,025	409,357	3	10	11¾

1817	18,396,400	992,744	4	15	10½
1818	21,330,746	953,869	3	19	7½
1819	21,492,839	951,431	3	19	10½
1820	24,742,242	958,124	3	10	7¾
1821	24,781,957	964,515	3	10	4¾
1822	24,022,441	950,644	3	10	7
1823	22,375,780	933,815	3	13	9½
1824	23,498,903	923,864	3	10	0¾
1825	18,055,446	889,994	4	1	8
1826	16,158,649	857,310	4	12	10
1827	15,446,801	846,591	4	13	5¾
1828	16,718,861	829,162	4	4	10¾
1829	15,761,547	822,070	4	10	1¼
1830	14,747,976	840,101	4	16	5¼
1831	12,411,676	797,298	5	11	3¾
1832	12,909,188	762,863	5	6	2
1833	12,846,800	750,982	5	5	1½
1834	11,061,893	748,724	6	1	8
1835	9,518,688	738,812	6	16	0

The gross and net receipt, charges of management, and the rate per cent. for which the gross revenue of excise in England, Scotland, and Ireland respectively, were collected, for the year 1835, were as follows:—

	Gross Receipt. £	Net Receipt. £	Charges of Management. £	Rate per cent. for which the Revenue was collected. £	s.	d.
England	10,861,182	10,255,486	738,812	6	16	0
Scotland	2,456,705	2,232,961	150,530	6	2	6
Ireland	1,911,464	1,906,150	183,049	9	11	6

The gross receipt, as stated in the foregoing abstract, was collected on the different articles subject to excise-duties in the following proportions:—

	England. £.	s.	d.	Scotland. £.	s.	d.	Ireland. £.	s.	d.	United Kingdom. £.	s.	d.

EXCITANTS. [STIMULANTS.]

EXCOMMUNICATION, from *Excommunicatio*, is the highest ecclesiastical censure which can be pronounced by a spiritual judge. The person against whom it is pronounced is for the time being excluded from the communion of the church. This punishment, as well as many others, springing from ecclesiastical jurisdiction, according to some opinions, had its origin in the advice given by St. Paul when reproving the early Christians for scandalizing their profession by prosecuting law-suits against each other before heathen judges; and the apostle accordingly recommended them to leave all matters in dispute between them to the decision of the Ecclesia, or the congregation of the faithful. This advice was soon followed, and heathen tribunals were seldom afterwards occupied by the controversies of the Christians.

The bishop and his clergy, and afterwards the bishop alone, became sole judge in these disputes; but possessing no coercive powers to enforce their decrees, they were obliged to adopt the only means of which they could avail themselves, to bring the refractory to submission, namely, by excluding them from the rites of the Church, and warning other Christians from their company and presence. A Christian thus shut out from the fellowship of his own brethren could not do otherwise than submit unconditionally.

This censure, although instituted by the primitive church as the means of preserving its purity, and of enforcing obedience to its just laws, was afterwards used for the promotion of ecclesiastical power, and was converted into an engine of the greatest oppression in those countries which were most subject to ecclesiastical rule. (Robertson's *History of Charles V.*, vol. ii. p. 109.)

In England excommunication became at a very early period the instrument of punishment under the authority of the bishops, and others possessing ecclesiastical jurisdiction. It was divided into the greater and the less excommunication. The latter only removed the person from a participation in the sacraments, and is what was most commonly meant by the term excommunication; the other was called anathema, and not only removed the party from the sacraments, but from the Church and all communication with the faithful, and even deprived him of Christian burial. Subjects were absolved from their allegiance to an excommunicated prince: indeed they were forbidden to obey him. Gregory V. was the first prelate who ventured to excommunicate a reigning prince in the case of Robert, king of France, in 998. John and Henry VIII. are well-known instances in English history. The latest instance of all was Napoleon, in 1809, by Pius VII.

Excommunication sometimes followed immediately upon the commission of an offence, and was then called canonical, to distinguish it from that which did not depend upon any established canon, but upon the sentence of a judge.

The following offenders were punished with the greater excommunication: diviners, heretics, their receivers and comforters; simoniacs; violators and plunderers of churches; those who spoiled clerks going to Rome; the plunderers of the property of a bishop which ought to go to his successor; those who gave aid, favour, or counsel to excommunicated persons; those who laid violent hands on clerks or religious persons, or commanded others to do so.

Those punished with the less excommunication were persons committing any mortal sin, as sacrilegious persons; those who received a church from lay hands; notorious offenders; those who talked with, saluted, or sat at the same table with, or gave anything in charity to persons excommunicated by the greater excommunication, unless they were familiars or domestics.

Excommunication was also pronounced for other matters which belong to ecclesiastical jurisdiction, as adultery, incontinence, fornication, &c., or for contempt of any ecclesiastical order or sentence. A sentence of excommunication was preceded by three monitions at due intervals, or one peremptory, containing the legal space of time, with a proper regard to the quality of the person and the nature of the offence. But, as Blackstone remarks, 'heavy as the penalty of excommunication is, considered in a serious light, there are, notwithstanding, many obstinate or profligate men, who would despise the *brutum fulmen* of mere ecclesiastical censures, especially when pronounced by a petty surrogate in the country, for railing or contumelious words, for non-payment of fees or costs or other trivial causes. The common law therefore compassionately steps in to the aid of the ecclesiastical jurisdiction, and kindly lends a supporting hand to an otherwise tottering authority.' This was effected by the writ 'de

excommunicato capiendo,' or for seizing the excommunicate. But before the writ for taking the excommunicated person could be granted the contumacy and contempt of the party were to be certified by the bishop to the court of Chancery by letters under his seal; and by 5 Eliz. c. 23, the writ was made returnable into the King's Bench. By the statute just cited the cause of excommunication was to be stated in the writ, in order that the court might judge as to the justice of the case. The sentence of excommunication might be revoked by the judge who passed the sentence, or upon appeal the party might be absolved. Absolution generally belonged to the same person who passed the sentence, unless in some particular cases, which were referred to the pope or a bishop. (Reeves' *Hist. of English Law;* Sullivan's *Lectures.*)

By a sentence of excommunication, both greater and less, those denounced were excluded from the right of Christian burial, from bringing or maintaining actions, from becoming attornies or jurymen, and were rendered incapable of becoming witnesses in any cause. But since the 53rd Geo. III. c. 127, excommunication cannot now be pronounced in England, except in certain cases (as spiritual censures for offences of ecclesiastical cognizance); and by the 3rd section of that statute 'no person who shall be pronounced or declared excommunicate (pursuant to the second clause of this statute) shall incur any civil penalty or incapacity, in consequence of such excommunication, save such imprisonment, not exceeding six months, as the court pronouncing or declaring such person excommunicate shall direct.' The proceedings in those cases, in which excommunication may still be pronounced, are the same, as to the issuing and return of the writ, as they were before the act of 53 George III. By the same act (53 George III. c. 127), in all cases cognizable by the laws of England in ecclesiastical courts, when any person shall refuse to appear when cited by such court, or shall refuse to obey the lawful order or decree of such court, no sentence of excommunication, except in the cases above alluded to, shall be pronounced; but a writ 'de contumace capiendo' shall issue, which in effect is the same as the old writ 'de excommunicato capiendo' was. Thus the various difficulties are now obviated which formerly existed in courts of law with respect to excommunication.

EXECUTION is the effect given to the judgments and other proceedings analogous to judgments of courts of law and in civil suits. This term denotes the process by which a party is put into the actual possession of that to which by the proceedings of a court he appears to be legally entitled.

As a judgment of a court of common law ascertains that the party is entitled to the possession of some subject of a real or personal nature; or to recover damages in respect of property withheld or injuries done, so the execution founded upon such judgment will be framed with a view to putting the party in whose favour the judgment is given either in the actual possession of the thing in dispute, or to enable him to obtain pecuniary compensation.

For this purpose a written command issues in the name of the king or other lord or owner of the court, to an officer of the court: when the judgment is in one of the king's superior courts at Westminster, the officer of the court for this purpose is the sheriff of the county in which the property is situate, or, in the case of pecuniary compensation, the sheriff of the county in which the party from whom such compensation is due is supposed to reside; which, until the contrary is shown, is taken to be the county in which the litigation was carried on.

Where lands or other corporeal hereditaments are recovered, the process of execution varies according to the nature of the interest recovered. If a right to a freehold interest has been established, the writ commands the sheriff to give the recoverer seisin of the lands, &c., and is called habere facias seisinam. [HABERE FACIAS SEISINAM.] If a chattel interest only is recovered, the writ does not affect to authorize the sheriff to intermeddle with the freehold, and directs that officer merely to give possession of the land, &c. This is called an habere facias possessionem. [HABERE FACIAS POSSESSIONEM.]

A judgment in the action of detinue [DETINUE] establishes the right of the recoverer to the possession of a specific personal chattel, and the writ of execution called a distringas ad deliberandum issues, requiring the sheriff to coerce the defendant by his distringas (distress) to restore the specific chattel or its value.

A judgment for the defendant in replevin [REPLEVIN] establishes his right to the possession of the personal chattel which formed the subject of the litigation. In the ordinary case of an action of replevin after a distress, the right of the defendant in respect of the chattel distrained is merely to hold it as a security for the payment of the debt or duty, the payment or performance of which is sought to be enforced by the coercion of a distress. [DISTRESS.] The writ of execution requires the sheriff to cause the chattel to be restored to the possession of the defendant. This is called a writ de retorno habendo, and in case the sheriff is unable to find the chattel, further process issues commanding him to take other chattels of the plaintiff as a substitute for that which is withheld, by a writ called a capias in withernam.

The most ordinary cases of execution are those in which pecuniary compensation is to be obtained, but in these cases the sheriff is not authorized directly to take money from the party by whom it is to be paid. Formerly the only mode of obtaining this compensation was by process of distringas or distress. And this is still the case in inferior courts; but in the superior courts execution of judgments or other records establishing pecuniary claims may be had by a writ of fieri facias [FIERI FACIAS] affecting the personal property; by writ of elegit [ELEGIT], affecting both real and personal property; and by capias ad satisfaciendum [CAPIAS], by which compliance with the pecuniary demand is enforced by detention of the person of the defaulter in prison until the claim be satisfied, or the adverse party consents to his discharge.

A subject is not entitled to pursue all these remedies at once; but in the case of the crown, the right to obtain satisfaction from the goods, lands, and person of its debtor may be enforced simultaneously, by writ of capias, and extendi facias, or extent. [EXTENT.]

EXECUTION is also the term applied to denote the giving effect to the sentence of a court of criminal jurisdiction. In this sense it is most commonly used with reference to the execution of sentence of death. [SHERIFF.]

EXECUTOR. An executor is he to whom another man commits by will the execution of that his last will and testament. He answers in some degree to the *hæres designatus*, or *testamentarius*, in the civil law, as to the debts, goods, and chattels of his testator; but the origin of executors seems to be properly traceable to a constitution of Manuel Comnenus (περὶ διοικητῶν τῶν διαθηκῶν). All persons who are capable of making a will, and some others besides, as married women and infants, are capable of being made executors; but infants are by statute rendered incapable of acting in the execution of the will until they attain the age of twenty-one.

An executor can derive his office from a testamentary appointment alone, though it is not necessary that he should be appointed by express terms; any words of the testator indicating an intention to make the appointment are sufficient: in this case he is usually called 'executor according to the tenor.' If no executor is appointed by the will, administration is granted by the ordinary, with the will annexed, in which case the administrator is bound to obey the directions given by the will. An executor may renounce probate; but having once acted, he cannot divest himself of the office or its liabilities; nor can an administrator who has accepted the office, get rid of his responsibility.

An executor may do many acts in execution of the will, even before probate, as paying and receiving debts, &c., but he cannot, before probate, sustain actions or suits. An administrator can do nothing till the letters of administration are issued; for the former derives his power from the will, and not from the probate: the latter owes his entirely to the appointment of the ordinary. If an executor die before probate, administration must be taken out to his testator, with the will annexed; but if an executor, having proved the will, die, his executor will be the executor and representative of the first testator, unless, before proving the will of the second testator, he expressly renounces the execution of the will of the first. If the executor dies intestate, his administrator is not the representative of the testator, but an administrator *de bonis non* of the testator must be appointed by the ordinary. If there are several executors, the office survives, and is transmitted ultimately to the executor of the surviving executor, unless he dies intestate. Executors have a joint and entire interest in the effects of their testator; any one of them is capable of acting by himself; and the receipt of a debt, or the transfer of property by one, is as valid as if it had been done by all.

If a stranger takes upon himself to act as executor without any authority, as by intermeddling with the goods of the deceased, he is called an executor *de son tort* (of his own wrong), and is liable to all the trouble of an executor without any of the advantages attached to the office. He is chargeable with the debts of the deceased, so far as assets come to his hands; and is liable not only to an action by the rightful executor or administrator, but also to be sued as executor of the deceased by his creditors and legatees. The only advantage which an executor derives from his office is the right to retain any debt due to him from the testator, as against creditors of equal degree, and this privilege is allowed him, because he cannot take any legal steps to recover payment. This, though practically a privilege, is in reality only a provision of the law that he shall not be prejudiced by his appointment; otherwise as a man cannot sue himself, all the other creditors would, by instituting a suit against the executor, gain priority over him in respect of their debts.

The duties of executors and administrators are in general the same, the only essential difference between them being, as before mentioned, the mode of their appointment. Their duties are to bury the deceased, to prove his will in the proper Ecclesiastical Court, to collect and get in his goods and chattels, to pay his debts in the order appointed by law, and also his legacies, if he has bequeathed any, and to dispose of the residue of his goods and chattels in the manner by the will directed, or according to the statutes for the distribution of the effects of intestates, if there should be a total or partial intestacy. Executors and administrators are liable to an action at law, and also to a suit in equity, for the payment of the debts and liabilities of their testator or intestate; and to a suit in equity and the Ecclesiastical Court for the legacies bequeathed by him, and the due administration of his estate: but no action at law lies for a legacy, at least not until after the executor has assented to it, as it is called, that is, has acknowledged the sufficiency of the assets after providing for the payment of the debts. [LEGACY.]

It appears to have been a subject of much controversy whether the probate of wills was originally a matter of exclusive ecclesiastical jurisdiction, but whatever may have been the case in earlier times, it is certain that at this day the Ecclesiastical Courts are the only courts in which, except by special prescription, the validity of wills of personalty can be established or disputed. If all the goods of the deceased lie in the diocese or jurisdiction within which he died, the probate is made before the bishop or ordinary of that diocese or jurisdiction; but if he had *bona notabilia* (that is, goods and chattels to the amount of 5*l*.) within some other diocese or jurisdiction than that in which he died, then the will must be proved before the archbishop or metropolitan of the province by special prerogative; and if there be *bona notabilia* in different provinces, there must be two prerogative probates. A will should be proved within six months after the death of the testator, or within two months after the termination of any dispute respecting the probate. (See 55 Geo. III. c. 184, sec. 57.)

Executors and administrators are treated by the courts of equity as trustees for the creditors, legatees, and next of kin of their testators or intestates. They are bound to administer the assets according to their due order of priority and to pay the debts of the deceased in like manner; and though the ecclesiastical courts will entertain suits for the payment of debts or legacies and the due administration of the assets, yet, where there is any trust to be executed, or any charge on real estate to be established, a court of equity will interfere by injunction or prohibition; for the constitution of the ecclesiastical courts is not adapted to the administration of trusts, and over real estate they have no jurisdiction. The probate is exclusive evidence of a will of personalty; but courts of equity assume the jurisdiction of construing the will in order to enforce the performance of the trusts by the executor: hence they are sometimes styled courts of construction, in contradistinction to the ecclesiastical courts, which, although they also are courts of construction, are the only courts of probate. Formerly, the personal estates only of persons deceased were liable for the payment of their simple contract debts; but now, since the statute 3 and 4 Wm. IV. c. 104, real estates are liable for the payment of debts of that nature; and it may be broadly stated that all the real and personal estates of the deceased are assets for the payment of his debts. The personal estate is liable in the first instance, unless the testator direct otherwise. Estates descended are applied before estates devised; and in other respects the estates of the deceased are administered in the order laid down by the courts.

The debts are also payable in a certain prescribed order. 1. The funeral expenses, the expenses of probate, and the costs of a suit for the administration of the estates, if any be instituted. 2. Debts due to the crown on record or specialty. 3. Certain debts, which by statute are to be preferred to others, as poor-rates, by stat. 17 Geo. II. c. 38, &c. 4. Debts of record, as judgments, statutes, and recognizances. 5. Specialty debts, *i. e.*, debts due on bonds or instruments under seal. 6. Simple contract debts, as upon bills of exchange and ordinary verbal engagements. It seems that in this class debts due to the crown and the wages of domestic servants are entitled to priority.

A mortgage made by the testator must, if there be no specified direction in his will, be paid out of the personal assets, if there be sufficient to pay the other creditors and legatees; it is, in fact, considered as the personal debt of the testator: though, if he did not create the mortgage himself, but took the estate subject to the mortgage by purchase, inheritance, or devise, the debt, not being his personal engagement, must be borne by the estate itself. The executor must pay the debts in the order mentioned; for if he apply the assets in payment of those of a lower degree, he will be personally answerable, to the extent of the assets misapplied, to the creditor of the higher degree. He may, however, pay a debt of an inferior degree before one of a superior, provided he has no notice of the latter and a reasonable time has elapsed after the testator's death; except in the case of debts of record due to the crown, of which the executor is bound to take notice. An executor or administrator may also retain his own debt as against creditors of an equal degree; and he may pay any one or more debts to creditors of equal degree, although thereby he may exhaust the assets, unless a suit or action be commenced against him; and even in that case he may, by confessing a judgment, enable a creditor to obtain priority. But notwithstanding an action or suit be commenced, he may pay a creditor of a higher degree than the one proceeding against him; save only where the suit is for a general administration of the estate, when the executor should not make any farther payments.

The debts being all paid, the next duty of an executor or administrator is to pay the legacies, and distribute the personal estate to the next of kin of the testator if there be any overplus; but where the testator has made a residuary legatee, he is entitled to the surplus. If the assets are not sufficient for the payment of the legacies, the executor must pay to each legatee an equal proportion of his legacy, unless the testator has directed the order of payment, in which case the legacies must be paid in full in the prescribed order, and the whole loss must fall upon the last in order. Specific legatees, *i. e.* persons to whom a specific fund or article of property is given by the will, are not liable to abatement of their legacies, but receive the fund or article whether the assets are or are not sufficient to pay the other legatees; though if the fund is changed, or the article sold, or from any other cause is not in existence at the death of the testator, the legacy fails, or in technical language, is said to be adeemed. Executors and administrators cannot be compelled to pay legacies or distribute the personal estate before the expiration of a year after the decease of the testator; and not even then, if notice has been acquired or there is reasonable ground to suspect the existence of debts and liabilities. Indeed, unless the assets are of ample amount, the executor or administrator should not pay within the year, even though the testator has directed it to be done; for it has been held that such a payment affords no defence against a creditor, and the testator or intestate may be bound by covenants upon which subsequent liabilities may accrue; or he may have been a trustee, and some maladministration of the trust estate may be discovered after the lapse of many years. In these and many other cases, executors and administrators should not part with the assets until all chance of liability is at an end, or security be given by the parties receiving them to refund in case of need. This last course will sometimes be directed by a court of equity in a suit for a legacy; for though an executor or administrator may recover from the legatees or next of kin to whom he has handed over the assets in

case of subsequently-discovered debts of the deceased, it is obvious that this is a very insufficient and uncertain security. Where a legatee is an infant, or the testator has directed his executors to invest any portion of his estate in the funds, or has provided for some future payment to be made, or from any other cause, an investment by the executors becomes necessary, they are, in the absence of any express direction to the contrary, bound to make such investment in the Three per Cent. Consols, that fund being considered by the Court of Chancery as the most desirable for the purpose of investment. The rule is inflexible, and an executor who should disregard it would run great risk of having to pay the costs of a suit to compel him to place the money in that fund, and to make good any loss which might occur through the change of securities.

Full information upon these subjects will be found in the works of Williams, and Toller 'On Executors,' and Wentworth 'On Administrators.'

EXE'DRA (ἐξέδρα), a name given to certain open recesses in the buildings of the antients. There were numerous exedræ in the baths. Vitruvius says the spacious exedræ of the Greek palæstra were furnished with seats. The exedræ were placed in the three porticos of the palæstra. (Vitruvius, v. c. 9.) Sometimes in houses a covered hall, and of a square form, was called exedra. (Vitruvius, vi. cap. 5.) In the disposition of the Greek house the exedræ were placed looking to the west. (Vitruv. vi. cap. x.)

EXERCISE. [ANALEPTICS.]

EXETER, a city and a county of itself, locally in the hundred of Wonford, in the southern division of the county of Devon, of which it is the chief town; 44 miles northeast from Plymouth, and 174 west by south from London.

Exeter is supposed to have been a settlement of the Britons before the Roman invasion. It was then called 'Caer-Isc' and 'Caer Rydh,' the former derived from its situation on the Ex or Isc, the latter from the red soil on which the castle is built. By the Romans it was called Isca Dumnoniorum, to distinguish it from the Isca Silurum in Wales. From the number of coins, small bronze statues (evidently Penates), tesselated pavements, and other Roman antiquities discovered near the walls and in the neighbourhood of the city, it must have been a Roman station of some importance. It is uncertain how long Exeter retained its appellation of Isca Dumnoniorum, but in the reign of Alfred it had acquired that of Exan-Cestre (castle on the Ex), whence its present name.

In the reign of King Stephen, Baldwin Rivers, earl of Devon, fortified Exeter on behalf of the Empress Maude, and did not yield till reduced by famine after a long siege. It was besieged in the 12th year of the reign of Henry VII. by Perkin Warbeck, and again by the rabble of Devonshire and Cornwall in 1549.

The city of Exeter was formerly surrounded by walls and strongly fortified. Leland, in speaking of it, says, 'The toune is a good mile and more in cumpace, and is right strongly waullid and maintained. Ther be diverse fare towers in the toune waul bytwixt the south and west gate. There be four gates in the toune, by names of Est, West, North, and South. The Est and the West Gates be now the fairest, and of one fascion of building: the South Gate hath been the strongest.' Situated on a high eminence, on the north side of the town, are the ruins of the castle, called 'Rougemont.' When this castle was first erected is unknown; but it was either rebuilt or much repaired by William the Conqueror, who bestowed it on Baldwin de Briono, husband of Albrina his niece, in the possession of whose descendants it remained till the 14th year of the reign of Henry III., who then took it into his own hands. It was completely dismantled during the civil war, and has never since been rebuilt. In the area of the castle-yard a session-house has lately been erected, which is a neat-looking building, faced with Portland stone, and contains, in addition to two good-sized courts, a grand-jury room, magistrates' room, &c. In front is a fine open space, where county, election, and other meetings are held. To the north of the castle is a delightful walk, shaded by fine old elm trees, called Northernay. Nearly in the centre of Exeter is the guildhall, where the assizes for the city (which is a county of itself) are held, as well as the sessions, elections, and other business relative to the city alone. The building contains several valuable portraits, amongst others, those of Henrietta Maria, Charles the First's queen, of her daughter Henrietta duchess of Orleans, and of General Monk. The only other antient building of any importance at Exeter is the cathedral. It is uncertain when the present edifice was begun, but probably it was soon after the see of Devon was transferred to Exeter from Crediton, which was its locality till the year 1049. At all events it was considerably altered and enlarged by Warlewast, third bishop of Exeter, who was a Norman, and came over with the Conqueror. It then assumed its present cruciform shape, but underwent numberless alterations and additions during the thirteenth and fourteenth centuries. It now consists of a nave, 76 feet in width and 175 in length, with aisles on each side; two short transepts, formed by two Norman towers 130 feet in height; a choir of the same width as the nave, and 128 feet in length; ten chapels or oratories, and a chapter-house. The whole building from east to west (including St. Mary's Chapel) is 408 feet in length. The western front is highly decorated with a profusion of niches and elegantly carved figures, and presents one of the richest façades of any building in Europe. The towers are highly interesting to the antiquary as specimens of Norman architecture. The interior is also exceedingly fine; the vaulted roof of the nave is supported by clustered columns, surmounted by fine pointed arches; as is also that of the choir, which is separated from the nave by a screen of exquisite workmanship. The chapter-house is a beautiful edifice, with a handsome oak roof: it was used as a stable by Cromwell and his soldiers, but has since been thoroughly repaired, as other parts of the building also have lately been.

In the north aisle are the splendid monuments of Sir Richard and Bishop Stapleton. The organ, with the exception of the one at Haerlem, is perhaps the largest in Europe: the large pipes are nearly twenty-three feet in height, and four feet in circumference. (For a further account of this truly magnificent building we must refer the reader to Risdon; Oliver; Britton's *Cathedral Antiquities*, &c. &c.)

The city was antiently held in demesne by the crown; its earliest charter was granted by Henry I., and confirmed by Henry II. and Richard I. The governing charter was granted by George III. in 1770. The corporation hold a court of quarter-sessions, and the assizes are held by the judges of the western circuit twice a year for the county of the city at the guildhall, and twice a year for the county at the session-house. There is also a county court, and a court of requests for the recovery of debts under 40*s*., the former held every Tuesday, the latter once a fortnight. Petty sessions are held before the magistrates of the county every Friday at the session-house; and some magistrate of the city sits every day at the guildhall. Under the Municipal Act, Exeter is divided into six wards, with twelve aldermen and thirty-six councillors.

Exeter has returned two members to parliament ever since the reign of Edward I. At the first election after the passing of the Reform Act, there were 2952 registered voters. The population of the city and borough is 28,242, of whom 15,559 are females. There are not many manufactories, and the population is chiefly employed in handicraft and the retail trade.

The city of Exeter comprises the parishes of Allhallows, Allhallows on the Walls (the church of which has been demolished), St. Edmund, St. George, St. John, St. Kerrian, St. Lawrence, St. Martin, St. Mary Arches, St. Mary Major, St. Mary Steps, St. Olave, St. Pancras, St. Paul, St. Petrock, St. Sidwell, St. Stephen, and the Holy Trinity, and the parochial chapelries of St. David and St. Sidwell, and the extra-parochial precincts of the Cathedral Close and Bedford Chapel, all in the archdeaconry and diocese of Exeter. There are besides these several other chapels, as well as places of worship for Baptists, Quakers, Independents, Wesleyan and other Methodists, Unitarians, Catholics and Jews.

The town is pleasantly situated on a steep acclivity on the river Ex, over which a handsome stone bridge was erected in the year 1778, at an expense of about 20,000*l*., a little above the site of an antient bridge originally built in 1250. The streets, with the exception of the High Street and Fore Street, are generally narrow, but there are some handsome squares and terraces in Northernay, Southernay, &c., which contain many well-built houses. The town is lighted with gas, and well supplied with water by waterworks erected in 1794. The subscription ball-room is one of the finest country ball-rooms in England; it measures eighty feet by forty, and is very handsomely fitted up. There

is a subscription library in Fore Street; and in 1813 the Devon and Exeter Institution was founded, for the promotion of arts, &c., the library of which contains about 10,000 volumes. The theatre is a neat building. To the north of the city are the cavalry barracks, and very near them is the new bridewell and the county gaol, both of which are judiciously planned, and contain the governor's residence, chapel, &c. There is also a city prison. The port of Exeter extends from the coast near Lyme Regis to the Ness Point. The trade principally consists in woollen goods and manganese; the imports are wine, hemp, tallow, &c. A branch bank has lately been established here by the Bank of England. The market day is Friday; but there is a daily sale of meat, vegetables, fish, fruit, &c. Fairs are held on the third Wednesdays in February and May, the last Wednesday in July, and second Wednesday in December. There is a great horse fair held at Alphington, about one mile from Exeter.

The free grammar-school was founded by the citizens in the reign of Charles I.; the sons of freemen are instructed gratuitously. There are fifteen exhibitions to either of the universities of Oxford or Cambridge, six of which are of 36*l.* each, the others are much less. The school-room is partly formed of the remains of an antient convent, of Augustine friars founded in 1239. There are no less than ten charity schools in Exeter, independent of Sunday-schools; amongst others are St. Mary Arches' school, founded in 1686, by W. Wootton, for the instruction on Dr. Bell's system of forty-four boys, of whom thirty are clothed; the Devon and Exeter Central School, founded in 1811, where about 430 boys and 270 girls are taught to read and write; and the Exeter British School, where about 130 boys and about the same number of girls are instructed, without regard to party or sect. The Devon and Exeter Hospital is supported by subscription, and has a considerable income arising from funded property: it now contains above 200 beds. There is a lunatic asylum admirably managed, as well as a dispensary, an eye infirmary, and an institution for the deaf and dumb. The workhouse forms a large range of buildings in the London road; it contains a governor's house, committee rooms, &c., and affords accommodation to several hundreds of the poor. A savings' bank was established in 1815, and a mechanics' institution, consisting of above 200 members, in 1825. Amongst other alms-houses and poor-houses are those respectively founded by Mr. John Stevens, Mr. John Palmer, Sir Thomas Lethbridge, and Mr. John Webb. There are also numerous private donations and bequests for the instruction and benefit of the poor.

Many eminent men have been natives of Exeter; among the most distinguished are Josephus Iscanus or Joseph of Exeter, a Latin poet of the twelfth century, Baldwin, archbishop of Canterbury, Sir Thomas Bodley, founder of the Bodleian Library, Lord Chancellor King, Lord Gifford, and Sir Vicary Gibbs.

EXETER or EXON DOMESDAY, the name given to a record preserved among the muniments and charters belonging to the dean and chapter of Exeter cathedral, containing a description of the western parts of the kingdom, comprising the counties of Wilts, Dorset, Somerset, Devon, and Cornwall; supposed, as far as it extends, to contain an exact transcript of the original rolls or returns made by the Conqueror's commissioners at the time of forming the General Survey, from which the Great Domesday itself was compiled. It is written on vellum in the form of a book of the small folio size, containing 532 double pages. The skins or sheets of vellum of which it is composed vary in the number of leaves which they comprise from one to twenty; the lands of each of the more considerable tenants beginning a new sheet, and those of almost every tenant a new page. The lands in the counties of Devon, Somerset, and Cornwall belonging to one tenant, are classed together, the counties following each other, though not always in the same order; and, in like manner, the summaries of property in Wilts and Dorset are classed together.

The manuscript begins with the 'Inquisitio Geldi,' or taxation of the hundreds of Wiltshire; of which it contains no less than three copies, the third seeming to be a corrected edition of the other two. The taxation of the hundreds of Dorsetshire follows, and after it those of Devonshire, Cornwall, and Somersetshire. The Inquisition for each hundred states:—1. The total number of hides; 2. the number held by the king and his barons in demesne, with an enumeration of those for which the tax was not paid; 3. the number of hides for which the tax was paid, and its amount; 4. the tax in arrear, and the reasons for its so remaining. Throughout, the geld or tax is computed at the rate of 6*s.* for every hide.

Upon collating the returns of lands which form the great body of the Exeter Survey with the Exchequer Domesday, they have been found, with a few trifling variations, to coincide; one entry of property alone being discoverable in the Exeter which is omitted in the Exchequer Domesday, relating to Sotrebroc in Devonshire. The Exeter manuscript, however, is not complete in its contents. There are considerable omissions of lands in Wiltshire, Dorsetshire, and Devonshire; but these have evidently been cut out and lost. In Cornwall every manor mentioned in the Exchequer occurs in the Exeter Domesday. One leaf of this record was accidentally discovered in private possession within these few years, and has been restored to the manuscript. In the spelling of the names of places and persons there is a remarkable difference between the two records. Rilchetona, in the Exon Domesday, fol. 101, is Chichetone in the Great Domesday, tom. i., fol. 120. Modiforda, Exon, fol. 116, is Mundiforda in Domesday, tom. i., fol. 87. Pillanda, Exon, fol. 127 *b.*, is Welland, Domesday, tom. i., fol. 102 *b.* Illebera, Exon. fol. 139 *b.*, is Lilebere, Domesday, tom. i., fol. 88. There are also many observable differences in the names of persons, as Ulwardus Wite, mentioned in the Exon Domesday, fol. 116, is Vlwardus Albus in the Exchequer Domesday, tom. i., fol. 87. The Abbot of Battle in Sussex is called Abbas de Prelio in the Exon Domesday, fol. 195; but in the Exchequer Domesday, Abbas de Labatailge. Abbas de Aliennia, Exon, fol. 280, is Abbatia de Adelingi in Domesday. Adret, Exon, fol. 488, is both Eldred and Edred, Domesday, tom. i., fol. 118. Willielmus Capra of the Exon, fol. 398, is Willielmus Chievre in the Great Domesday. The names of tenants in King Edward's time are far more numerously preserved in the Exon than in the Exchequer Domesday. In the systematic arrangement of the subject matter the Exchequer Domesday bears unquestionably a decided preference over the Exon Domesday. Occasional insertions in the margin of the Exon Survey are entered in the text in that of the Exchequer. The lands of the great barons also in the Exon Survey are in a few instances intermixed. In folio 161 of the Exon, although the title of the lands described is 'Terra Abbatis Glastingheberiensis in Devenescira,' yet in fact there is only one of the manors in that county; the rest are all in Somersetshire, and are entered as such in the Great Domesday. On the contrary, in fol. 194 of Exon, the 'Terræ Ecclesiarum quæ datæ sunt Sanctis in Elemosina,' from all that appears on the face of the record are in Somersetshire; whereas they are really in Devonshire, and are so placed in the Exchequer Domesday.

The most striking feature however of the Exeter Domesday, in which it uniformly supplies us with additional knowledge to that in the Exchequer Survey, is the enumeration of live stock upon every estate; there is an account of the number of oxen, sheep, goats, horses, and pigs, exactly in the same manner as it is given in the second volume of the Great Domesday. The reason for omitting this enumeration in the breviated entries of the first volume of the Great Survey is self-evident. The live stock was altering every day and year; the enumeration of it therefore could be of no further use than for the exact time when the survey was made. A comparison of this part of the Exeter with the second volume of the Great Survey tends greatly to corroborate the notion that the returns of the counties of Essex, Norfolk, and Suffolk, were transcribed in full from the original rotuli, in the same manner as the Exeter Domesday. The difference between the two surveys as to diction, when they agree in sense, is likewise remarkable; as for instance,

Exchequer Domesday.	*Exeter Domesday.*
Acra	Agra
ad arsuram	ad combustionem
censores	gablatores
clerici	sacerdotes
geldabat	reddidit Gildum
leuca	leuga

Totum valet xxi. lib.	Hæc mans. reddit ad opus abb. x. & viii. lib. et ad opus tagnorum iii. lib.

The utility of this record for the purpose of comparison with the Exchequer Domesday is obvious. The Exeter Domesday was published with several other surveys nearly contemporary, by order of the Commissioners upon the Public Records, under the direction of Sir Henry Ellis, in a volume supplementary to The Great Domesday, folio, London, 1816. Our account of this record is chiefly derived from the Introduction to that volume.

EXETER COLLEGE, OXFORD, was originally founded in 1314, by Walter de Stapledon, bishop of Exeter, and some time lord high treasurer of England, and was then called Stapledon Hall. The bishop removed hither his scholars from Hart Hall, and made a foundation for a rector and twelve fellows. Of these thirteen he directed that eight should be elected from the archdeaconries of Exeter, Totness, and Barnstaple; four from the archdeaconry of Cornwall; and that one should be nominated by the dean and chapter of Exeter, from any place they might deem most fit, provided that he was in priest's orders. In 1404 Edmund Stafford, bishop of Exeter, added two fellowships from the diocese of Salisbury, and obtained leave to give the college its present name. In 1565 Sir William Petre, knight, secretary of state, and privy counsellor to Henry VIII., Edward VI., Queen Mary, and Queen Elizabeth, added eight fellowships for the counties of Devon, Somerset, Dorset, Oxford, Essex, and any others in England in which he or his heirs might have lands or possessions. These counties at present are Norfolk, Suffolk, Middlesex, Hampshire, and Kent. Charles I., in 1636, annexed one fellowship for the islands of Jersey and Guernsey, the candidates for which are nominated by the dean and jurats of one of these islands alternately. Lastly, Mrs. Shiers, who died in 1700, left certain rents, out of which two fellowships were founded for the counties of Hertford and Surrey, to which the five senior fellows alone elect. The candidates for all fellowships in this college are required by the statute to be, at least, *Generales Sophistæ* in the university. The day of election is the 30th of June, except for the Hertford and Surrey vacancies, when it is on St. Stephen's day. The present foundation consists of a rector and twenty-five fellows, besides whom there are numerous scholarships and exhibitions: and among these, three Eton Collegers, appointed by the provost and fellows of Eton; three from Exeter school, nominated alternately by the dean and chapter and chamber of Exeter; two from Truro school, nominated by the trustees of that school; and two from Exeter school. Two scholarships have been more recently founded by a bequest of the late William Gifford, for natives of the county of Devon, with a preference to candidates from the school of Ashburton.

Among the eminent men who have received their education here may be enumerated John de Trevisa, Sir John Fortescue, Sir John Doddridge, Sir William Noy, Joseph Caryl, Anthony Ashley Cooper, Lord Shaftesbury, Maundrell the traveller, John and Charles Wesley, Toup, Tindal the continuator of Rapin, and Dr. Kennicot.

The front of the college, which is opposite Jesus College, extends two hundred and twenty feet, with a large central gateway, consisting of a rustic basement, from which spring four pilasters of the Ionic order, supporting a semicircular pediment, crowned by a balustrade. The greater part of this front was renewed in 1835 with Bath stone. The hall was erected by Sir John Acland in 1620. The chapel, begun in 1622-3, was completed by Dr. George Hakewill, afterwards rector. The library was erected in 1778, after a design of the late Rev. W. Crowe, public orator.

On the 31st December, 1836, there were 304 members upon the college books. There are twelve benefices in the patronage of this society, one of which, the vicarage of Kidlington, in Oxfordshire, is annexed to the rectorship. The bishop of Exeter is the visitor of this college.

(Chalmers's *Hist. of the Colleges and Halls of Oxford*, 8vo., Oxf., 1810, vol. i., p. 62-76; *Oxford Univ. and City Guide*, 8vo.; *Oxford Univ. Calendar*, 1837.)

EXOCA'RPEÆ, a small division of Thymelaceous plants. [THYMELACEÆ.]

E'XODUS, THE BOOK OF, is the second of the Pentateuch, or Five Books of Moses, and derives its name from the principal event recorded in it, namely the departure of the Israelites from the land of Egypt, which, in the Greek Septuagint translation, is expressed by the word éxodos ("Ἔξοδος), that is, the going out. In the original Hebrew it is named, according to the usual Jewish mode, from the initial words, ואלה שמות *ualh shmut*, or, as read with the Masoretic points, Ve-aleh Shemoth, 'These are the names.' This book records the slavery and cruelty endured by the descendants of Israel (Jacob) under the kings of Egypt; the birth, exposure, and preservation of Moses; his flight into Midian; his divine mission to Pharaoh (at the age of 80; vii. 7); the miracles performed by him and his elder brother, Aaron; the ten plagues inflicted on the Egyptians; the institution of the Passover; the departure of the Israelites from Egypt; their miraculous passage across the Red Sea; the destruction of the Egyptian army; the journeyings of the Israelites in the Arabian desert; their murmurings against God and Moses; their resumption of the Egyptian worship of the calf under the direction of Aaron, and their consequent punishment; the promulgation of the law from Mount Sinai; and the erection of the tabernacle, or portable temple. The king, Pharaoh (a general Egyptian appellation of royalty), for whom the Israelites built the treasure cities, and by whom their male children were ordered to be drowned (chap. i.) is usually considered by the commentators to be Rameses, the eldest son of Sesostris; and the Pharaoh whose army perished in the Red Sea (xiv. 27) is supposed to be his son and successor, Amenophis the Second, or according to others, the Third. Le Père Pezron says he was Pharaoh Alisphragmuthosis, by whom the Hyksos, or Phœnician Shepherds, were expelled from Lower Egypt, whence the Israelites departed. The same chronologist makes the establishment of the Shepherd dynasty at Heliopolis coincident with the appearance there of Joseph from Canaan. (See the *Dissertation of* Perizonius *on the identity of the Hyksos and the Hebrews*.) The Mosaic exodus is noticed by several antient writers, but with brevity and apparent contempt. The Egyptian historians, Manethon and Chæremon, as cited by Josephus (*Against Apion*, l. i., c. 9, 11, 12), state that 250,000 leprous people, and others afflicted with contagious diseases were banished from Egypt (*Exod.* xii., 39, 'they were thrust out of Egypt') by king Amenophis; and that their chief was a priest of Heliopolis named Moses, who furnished them with a system of religion and laws. (See a similar account in Josephus, *Hist.*, l. v. c. 34; Tacitus, *Hist.*, l. v. c. 3; Diodorus Sic. *in Photii Biblioth.*, l. xxxiv.; Justin, l. xxxvi. c. 2.)

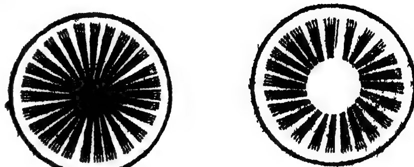
The period over which the history in the book of Exodus extends consists of 145 years, that is, from the death of Joseph (B.C. 1635) to the formation of the tabernacle in the desert of Arabia (B.C. 1490), one year after the exode in the year B.C. 1491. Mr. Horne, in his 'Introduction to the Bible,' adopts the general opinion of commentators that the book was written by Moses, yet he thinks that it cannot be determined at what time of his life; but, as it is stated (xvi. 35) that 'the children of Israel did eat manna 40 years until they came unto the borders of the land of Canaan' that is, on the banks of the Jordan, opposite Jericho, when

and where Moses died (*Gen.* xxxiv.), and, 'as things cannot be historically related,' as Mr. Horne observes, 'until they have actually taken place,' it is evident that, if Moses is the author, he must have written it immediately before his death (B.C. 1451). It must be observed however that, among biblical critics and chronologists a great difference of opinion exists as to what date should be assigned to the departure of the Jews from Egypt, and as to the book of Exodus being written by Moses. In chronological works the exodus forms the fourth grand epocha in the antient history of the world: thus, 1. The creation of Adam. 2. The Deluge of Noah. 3. The call of Abraham (his emigration from Chaldæa into Canaan). 4. The Departure of the Israelites from Egypt. This last event, according to the Hebrew text of the Scriptures, took place B.C. 1491; but according to the Samaritan text, which is the primitive Hebrew (Dr. A. Clarke) it occurred 267 years earlier, that is, B.C. 1758. The learned Pezron ('Canon Chronologique,' in his 'Défense de l'Antiquité des Tems,' 4to, 1691) adopting, with improvements, the chronology of the Alexandrine version, or Greek Septuagint, which adds 1500 years to the Hebrew age of the world, determines the exodus to have taken place A.M. 3953, and B.C. 2019. Whiston, Kennicott, Jackson, Brett, Hay, Geddes, and other divines, adopt the Greek chronology. Archbishop Usher ('Annales Vet. et Nov. Test.') prefers that of the Hebrew text. Dr. Andrews, in his 'Heb. Dict. and Chronol.' 1823, puts the exodus B.C. 1677. (See Dr. Hales's *Analysis of Chronology;* Sir John Marsham's *Chronicon Egyptiacum,* Ed.; Simson's *Chronicon Catholicon,* Lugd., fol. 1752; J. G. Frankius, *Novum Systema Chronol.,* Götting., fol. 1778; R. C. Beningsen, *Biblische Zeitrechnung,* Leips., 1763; Walker's *Analysis of Time,* 1796; *Remarks on the Bible Chronology,* 1830; *Criteria for determining the accuracy of Scripture Chronol.,* by J. Cullimore, 1830, p. 13.)

Moses, according to St. Justin, Tatian, Clemens Alexandrinus, Tertullian, Julius Africanus, and other Christian Fathers, as well as Josephus, Justus, Manethon, Ptolemæus of Mendes, Apion of Alexandria, Porphyry, and others, is supposed to have been contemporary with Inachus, whom the chronologists place from 270 to 450 years earlier than the birth of Moses according to the Hebrew text. (Du Pin, *Biblioth. Univer.;* Du Fresnoy, *Chronol.*) In the chronicon of Eusebius, the author of the Pentateuch is made contemporaneous with Cecrops, who became king of Athens (*Arund. Marb.*) 11 years before the birth of Moses (*Heb. text*), and, according to Pezron, 130 years after the death of Moses. (*Heb. text.*)

That the Pentateuch is not the production of Moses has been the opinion of many learned critics, both Christians and Jews, as Aben Ezra, Maimonides, Le Clerc, Dr. Middleton, Newton; and in Germany it is generally prevalent among the philosophical theologists of the *rational* school of Eichhorn. Dr. Geddes, who was deeply imbued with the German rationalism, makes the following statement in the preface to his new translation of the Bible from the Hebrew in 2 vols. 4to.:—'From intrinsic evidence three things to me seem indubitable. 1. The Pentateuch in its present form was not written by Moses. 2. It was written in the land of Canaan, and most probably at Jerusalem. 3. It could not be written before the reign of David, nor after that of Hezekiah. I would refer it to the reign of Solomon.' That is, about B.C. 1000, in or near the age of Homer and 500 years after that of Moses. Eichhorn (*Einleitung in das Alte Test.,* vol. ii. p. 245,) believes the first two chapters of Exodus to have been taken from the historical documents out of which the book of Genesis apparently was compiled. (See Astruc, *Conjectures sur les Mémoires originaux dont il parait que Moise s'est servi pour composer la Génése,* 12mo. Brussels, 1753.) By the Jews the Book of Exodus is divided into 11 paraches, or chapters, and 22 siderim, or sections. In English Bibles it is comprised in 40 chapters. Various passages and expressions in Exodus involve apparent difficulties which have exercised the critical skill of every commentator. All chronologists agree that from the time of the immigration into Egypt of Israel and his family (70 persons, chap. i.) to the exodus, was only 215 years; the 430 years mentioned xii. 40 signifying this period and a previous one of 215 years to the call of Abraham. The numeral increase of the children of Israel is therefore considered to be very unusual, since, in xii. 37, 38, it is said there were 600,000 men on foot, besides children and a mixed multitude, the total number, as computed by Dr. Adam Clarke in his Commentary, being 3,263,000 They are said to have been 'more and mightier' than the Egyptians, 'very mighty' (i. 9, 20), to have gone out with their 'armies' (xii. 51) 'harnessed,' that is, accoutred for battle (xiii. 18); and 'with a high hand' (xiv. 8), 'with flocks, and herds, and very much cattle' (xii. 38), but as they are also said to have been slaves to the Egyptians, who 'made them serve with rigour and hard bondage, in mortar, brick, and all manner of service in the field' (i. 14)—to have been led out of their nearest way to Canaan, lest, on seeing war with the Philistines, they should repent, and return to Egypt (xiii. 17), and to have been 'sore afraid' at the sight of the Egyptians' marching after them (xiv. 10), some commentators understand the word חמשים *pmshim,* to mean not harnessed, but slung together five in a string. Concerning the criminality of the Israelite women in borrowing and appropriating jewels and raiment of the Egyptians by the divine direction (iii. 21, 22, and xi. 2), and God's hardening the heart of Pharaoh (iv. 21), see *Explanations of Scripture Difficulties,* compiled by W. Carpenter, p. 35, &c. In xvi. 15 it is stated that the Israelites, when they first saw the manna, said one to another, 'It is *manna,* for they wist not *what* it was;' and in xxxviii. 8 of the English translation, it is said that the laver of *brass* was made of the looking-*glasses* of the women who assembled at the door of the tabernacle. These inconsistencies are avoided by Dr. Geddes; and he observes that the word מראת, *mrath,* translated looking-glasses, occurs in a hundred other places, but in no instance signifies the antient metallic mirrors. The ten miraculous plagues inflicted on the Egyptians are described in the following places:—1. Water turned into blood, vii. 14—25. 2. The land covered with frogs, viii. 1—15. 3. The dust of the land turned to lice, viii. 16—19. 4. The swarms of flies, viii. 20—32. 5. The murrain and death of all the cattle. 6. Ashes produce boils and blains on man and beasts, ix. 8—12. 7. The storms of devastating hail, rain, and fire, ix. 13—35. 8. All the land covered with locusts, x. 1—20. 9. Three days of darkness which might be felt, x. 21—27. 10. The death of all the first born of man and beast, xi. 5—7 and xii. 29, 30. The learned writer in the 'Universal History,' vol. 3, p. 374, shows that the Egyptian magicians and sorcerers were permitted to exhibit the power of the devil for the sake of exposing his comparative impotence; thus, although 'they did in like manner with their enchantments,' (vii. and viii.) in making their rods become serpents, in turning the Nile into blood, and in covering the land with frogs, yet, they could not, as Aaron did, turn the dust of the land into lice (viii. 18.) Jacob Bryant in his 'Treatise on the Ten Plagues,' 8vo., 1810, explains their adaptation to the peculiar character, habits, and notions of the Egyptian people, so as to cause the greatest possible aggravation of suffering and misery. The latter half of the 40 chapters of Exodus are occupied in announcing the civil, moral, and ceremonial law, and in describing the numerous articles of furniture, utensils, and sacerdotal raiment, for the celebration of sacrificial service in the tabernacle, or moveable temple, erected as a tent in the desert. The value of the gold appropriated to the vessels and ornaments of the adytum, or holy place, is stated in xxxviii. 24 at 29 talents and 730 shekels of gold. Each of the former being 5464*l.* 5*s.* 8¼*d.*, and each of the latter 1*l.* 16*s.* 5⅛*d.*, they amount to 159,793*l.* 11*s.* 3*d.*, that is, nearly 160,000*l.*

Many learned men, in observing the similarity of the Mosaic and Egyptian ritual and religious institutions as described in various antient writings, have assigned a greater antiquity to the latter, and contended that the former were a mere imitation. Dr. Geddes asserts that Moses made a selection and judicious composition from the antient Egyptian institutions. (See especially Spencer, *De Legibus Hebraicorum;* Sir John Marsham's *Chronicon Egyptiacum;* Jablonski's *Pantheon Ægyptiorum;* Ikenius, *Dissertatio de Institutis et Ceremoniis Legis.*) Plutarch (*De Iside*) and other antient authors prove that Jehovah or Jao was the sacred name of God among the Egyptian priests; and that it was not known to the Israelites before their residence in Egypt is stated in *Exod.* vi. 3. The 'I AM' of chap. iii. 14 is compared with the Egyptian inscription on the personification of the universe, 'I am all that is.' (See Plutarch, περὶ τοῦ Εἰ ἐν Δελφοῖς.) Aaron's oracular breast-plate (xxviii. 15—30) is thought



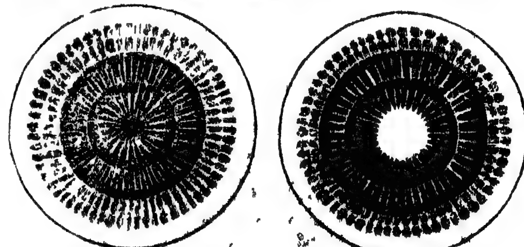
to be identical with that of the Egyptian chief judge, as described by Diodorus Sic. l. i. c. 2, sec. 26.

The learned Huet, Vossius, and others give curious parallels of the birth, life, and deeds of Moses with the primitive Egyptian Bacchus, but this is not more strange than the statement of Origen, who says in his 'Homily on Exodus' that Pharaoh is the devil, his daughter the church, and the two midwives (i. 15) are the 'Old and New Testament.' (See *The Scholia* of Dathe, Rosemüller, Schulz, Bauer, and Eichhorn; Willet's *Hexapla or Sixfold Comment on Exodus; Translations and Comments*, by Ainsworth, Hopkins, and Bishop Kidder; Dr. A. Clarke's *Bible*; Horne's *Introduction*, and list in Watt's *Bibliotheca*.)

EXOGENS, the largest primary class in the vegetable kingdom, are so named in consequence of their woody matter being augmented by additions to the outside of that which is first formed near the centre. As long as they continue to grow they add new wood to the outside of that formed in the previous year, in which respect they differ essentially from Endogens, whose wood is constructed by successive augmentations from the inside [ENDOGENS.] All the trees of cold climates, and the principal part of those in hot latitudes, are exogenous. In many cases they are easily recognised by the wood of each different year forming a distinct zone, so that a section of their wood exhibits a number of concentric circles; but there are so many exceptions to this rule as to render it necessary to consider this character as by no means essential to them.

The nature of the exogenous mode of growth will be best compared with that of an Endogen, if we pursue the same mode of illustration as in the article which treats of the latter form. We will therefore proceed from an explanation of the typical mode of growth in a common Exogen to such remarks as we may have to offer upon deviations from it.

In an Exogen of ordinary structure the embryo consists of a cellular basis, in which there is usually no trace of woody or vascular tissue; but as soon as germination commences fine ligneous cords are seen proceeding from the cotyledons towards the radicles from the opposite sides of the young stem, meeting in the centre of the embryo, and forming a thread-like axis for the root.* As the parts grow the ligneous cords are increased in thickness and number, and having been introduced among the cellular basis of the embryo, are separated from each other by a portion of the cellular substance, which continues to augment both in length and breadth as the woody cords lengthen. By degrees the plumule or rudimentary stem becomes organized, and having lengthened a little, forms upon its surface one, two, or more true leaves, which gradually expand into thin plates of cellular substance traversed by ligneous cords or veins converging at the point of origin of the leaves. If at that time the interior of the young plant is again examined, it will be found that more ligneous cords have been added from the base of the new leaves down to the cotyledons, where they have formed a junction with the first wood, and have served to thicken the woody matter developed upon the first growth. Those ligneous cords which proceed from the base of the leaves do not unite in the centre of the new stem, there forming a solid axis, but pass down parallel with the outside, and leave a small space of cellular tissue in the middle; they themselves being collected into a hollow cylinder, and not uniting in the middle until they reach that point where the woody cords of the cotyledons meet to form the solid centre of the root. Subsequently the stem goes on lengthening and forming new leaves: from each leaf there may be again traced a formation of woody matter disposed cylindrically as before, and uniting with that previously formed, a cylinder of cellular substance being left in the middle; and the solid woody centre of the root proceeds in its growth in a corresponding ratio, lengthening as the stem lengthens, and increasing in diameter as the leaves unfold and new woody matter is produced: the result of which is, that when the young Exogen has arrived at the end of its first year's growth it has a root with a solid woody axis, and a stem with a hollow woody axis surrounding cellular tissue, the whole being covered in by a cellular integument. But as the woody cords are merely plunged into a cellular basis, the latter passes between them in a radiating manner, connecting the centre with the circumference by straight passages, often imperceptible to the naked eye, but always present. The following diagram illustrates this:—



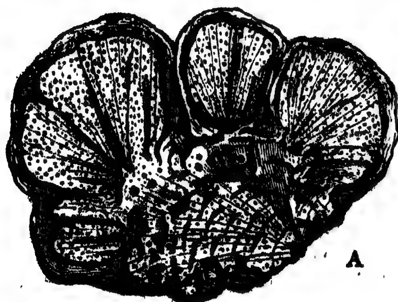
Root. Stem.

Here we have the origin of *pith* in the central cellular tissue of the stem, of *wood* in the woody axis, of *bark* in the cellular integument, and of *medullary processes* in the radiating passages of cellular tissue connecting the centre with the circumference.

The woody axis is not however quite homogeneous at this time. That part which is next the centre contains great numbers of vessels of different kinds, particularly dotted vessels (vasiform tissue); the part next the circumference is altogether destitute of vessels, and consists of woody tissue exclusively: of these two parts that with the vessels belongs to the wood, properly so called, and serves as a mould on which future wood is added; the other belongs to the bark, separates under the form of liber, and in like manner serves as a mould upon which future liber is disposed.

At the commencement of a second year's growth the liber separates spontaneously from the true wood, a viscid substance called *cambium* is secreted between them, and the stem again lengthens, forming new leaves over its surface. The ligneous cords in the leaves are prolonged into the stem, passing down among the cambium, and adhering in part to the wood and in part to the liber of the previous year, the former again having vessels intermingled with them, the latter having none. The cellular tissue that connected the wood and liber is softened by the cambium, and grows between them horizontally while they grow perpendicularly, extending to make room for them, and consequently interposed between the woody cords of which they each consist, forming in fact a new set of medullary processes terminating on the one hand in those of the first year's wood, and on the other in those of the first year's liber. This addition of new matter takes place equally in the stem and in the root, the latter extending and dividing at its points, and receiving the ends of the woody cords as they diverge from the main body. The following diagram illustrates this, and shows, when compared with the last, what difference there is in the appearance of the stem of an Exogen one and two years old.

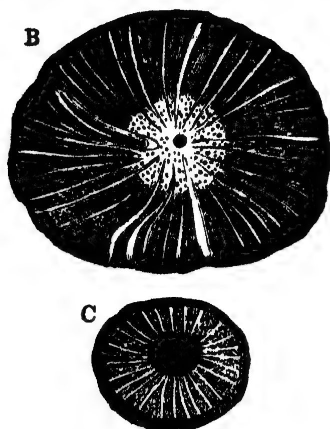
Root. Stem.



And thus, year after year, the Exogen goes on, forming zone upon zone of wood, which is permanent, and zone within zone of liber, which perishes as the stem increases in diameter. [BARK.]

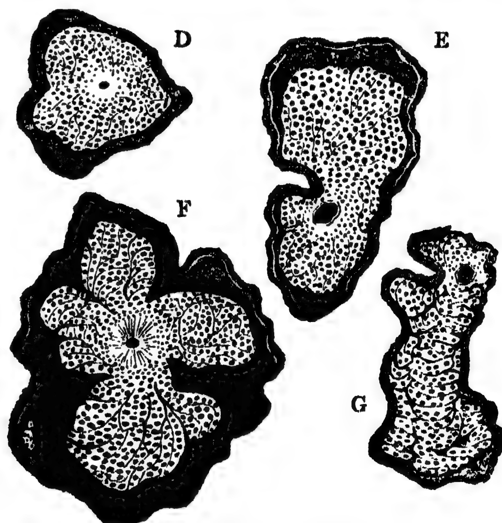
If this account is compared with that already given of Endogens, it must be obvious that the stem of these two great classes is formed from the very beginning in an essentially different manner. Endogens have no cylindrical column of pith; their woody arcs are never collected into a cylinder, through the sides of which the cellular tissue passes in the form of medullary processes; and the woody matter of their bark, so to call their cortical integument, is not parallel with that of the wood and spontaneously separable from it; not to speak of important anatomical differences, or of the concentric arrangement eventually assumed by the wood of Exogens. The only points in which the growth of the stem of Exogens corresponds with that of Endogens are the following: in both classes the woody

* In the article Endogens the reader is requested to make the following correction in the early part of the fourth paragraph:—for (fig. A, p. 396) read (A); and twenty lines farther on, for (fig. A) read (A).



matter is connected with the leaves; in both a cellular substance is the basis of the whole structure, and extends horizontally wherever it is necessary to do so; and in certain Exogens woody arcs, stated to be like those of Endogens, are found in the pith. These cases properly belong to anomalous forms, but nevertheless may be noticed here, in consequence of their direct connection with this branch of the subject. One case is that of Zamia: but as that genus now belongs to the new class of Gymnosperms and not to Exogens proper, it need not be considered here. The other cases are Piper, Nyctaginaceous plants, and some others. Professor Schultz states (*Natürliches System des Pflanzenreichs*, p. 320, &c.) that in Piper, Mirabilis, and Boerhaavia, the central part of the stem consists of cellular tissue, amongst which cords of spiral vessels and woody tissue are placed either without order, or (in Boerhaavia) in a cruciate manner as in tree-ferns, and that on the outside of this the woody bundles are arranged circularly into a cylinder. A similar statement had long previously been made by Mirbel, who ascribes to Mirabilis and some Umbelliferous plants longitudinal vessels in the pith (*Elém. de Physiol. Veget.* i. 112), and by Professor Meyer, who finds the pith of Mirabilis longiflora and dichotoma, Boerhaavia scandens, and Oxybaphus Cervantesii abounding in many large bundles of spiral vessels within the woody radiated zone. (*De Houttuynia atque Saurureis*, p. 40.) This, if correctly described, only shows that in certain Exogens a portion of the central tissue is placed at first in a confused manner, and that the wood does not assume a definite circular disposition till afterwards; that it does assume it eventually is admitted. We find in Piper nigrum and Lonchitis that from the beginning the woody bundles are placed circularly, but they are separated by a good deal of cellular tissue, and do not assume in the first zone the wedge-like or triangular form which is most common in Exogens, and which they themselves at last take on. In Boerhaavia repanda, a specimen of which is now before us, we find the wood regularly disposed in two zones, and instead of spiral vessels a very singular structure in the pith, which is filled with fistular passages of lax soft spheroidal cellular tissue surrounded by smaller, harder, and more cubical cellular tissue which passes off into the medullary processes. It is in such plants as Piper incanum that the organization of Exogens most nearly approaches that of Endogens; but in the first place the whole race of Pipers forms a sort of transition from Exogens to Araceous Endogens; and secondly, it is probable that when they are most endogenous in appearance they are not really so in regard to the final development of their woody tissue.

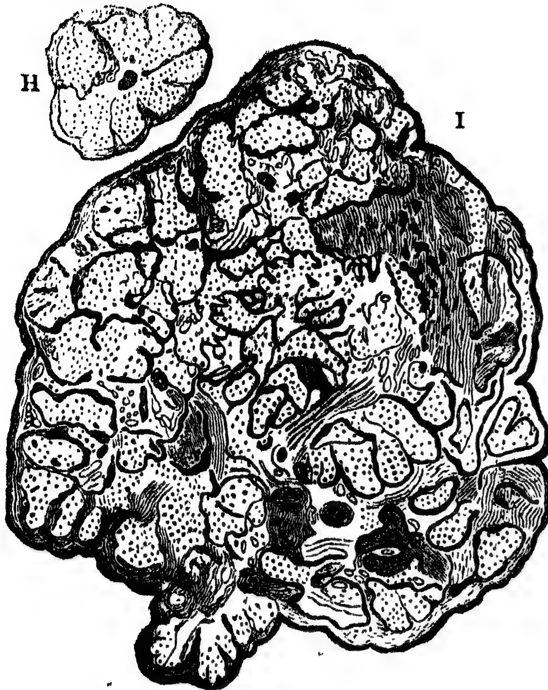
Let it however be admitted that in certain cases Exogens are, in the centre of their stem, organized less regularly than usual; this will offer no argument in favour of their analogy with Endogens. In all such cases it will be found that they eventually assume their typical conformation. We are acquainted with some striking proofs of this. Among twining plants of tropical countries, we occasionally find instances like the following—



Beneath a most irregularly compressed and lobed bark there lies a mass of wood, apparently so confused and irregular in its arrangement in the centre, that nothing symmetrical can be made out by the most acute observer; but it will be seen that towards the circumference it distinctly assumes the radiated appearance of an Exogen. In other cases, where the structure is sufficiently regular, this circumstance is still more distinctly illustrated.

It is however more commonly at the centre that we look for typical structure, and at the circumference that we find irregularity; as if Exogens usually commenced their growth according to the plan to which nature has subjected them, and only deviated from it under the influence of unknown

causes coming into operation and controlling their development after they have advanced to a certain stage in their growth. Thus in the singular instances shown in cuts D, E, F, and G, the principal part of the stem is so confused and irregular as to look more like an Endogen than an Exogen, and a fragment might easily be mistaken for the former; nevertheless in a young and tolerably regular shoot (D) the radiated appearance is sufficiently well marked; and in two others, irregular and distorted as they are (E and G), the central pith is visible, although far out of the centre; and in the fourth (F) the centre has not only pith, but a radiated structure that is quite regular.

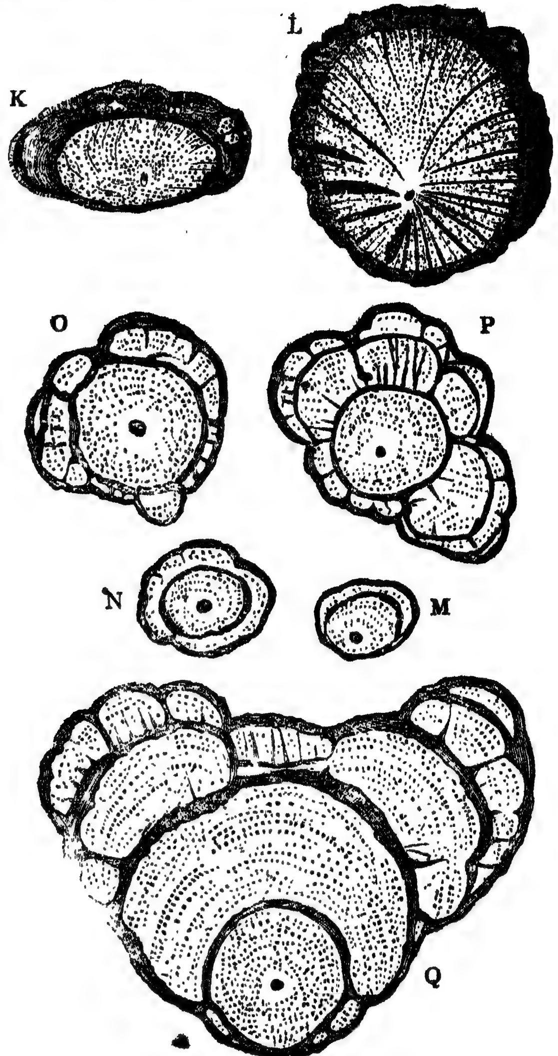


By far the most singular case of this sort is in an unknown twining plant in our possession from the Malayan Archipelago, of which the cuts H and I are representations In old stems of this plant a section exhibits a most irregular combination of wood, looking like palm wood, broken up into lobed cords lying amongst still more irregular cellular

tissue, and inclosed in a common bark; so that we doubt whether it would be possible to tell to which class it really belongs, if it were not for its young shoots and the pith of the old ones. The latter may be seen lying quite out of the centre towards one side (near the bottom of our figure, a little to the right); and in the former (H) the pith is found with wood radiating around it, although still with sufficient irregularity.

The cases already given are evidences of exogenous wood being sometimes extremely different from the condition in which we see it in Europe, and attest the necessity of forming our ideas of its nature from a more extended examination than that which is commonly given to it. Several curious cases have been previously published by the author of this article (*Introduction to Botany*, edition 2, p. 77, &c.), and others have been noticed by other writers, but the subject has been so little investigated that we gladly avail our

selves of the present opportunity of making known some additional facts.



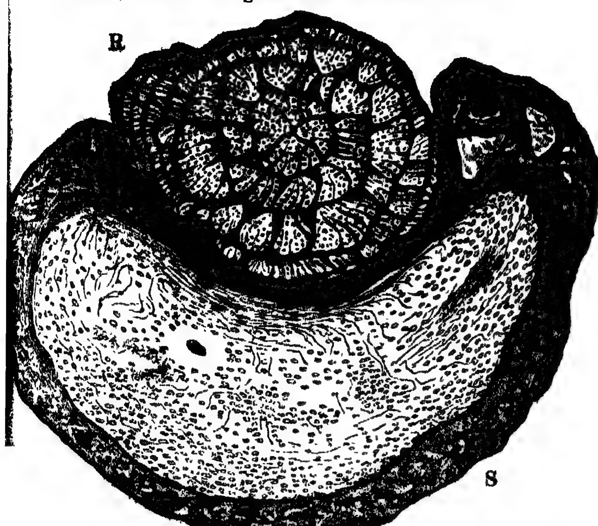
Irregularity in the structure of exogenous wood is usually owing either to a confused disposition of the tissue at some particular period of the growth, or to some derangement of the medullary processes, or to the absence of concentric circles, or to the formation of a deep zone of cellular tissue alternately with each zone of wood; or, finally, to the production of wood within the bark instead of beneath it. The first cause has been already sufficiently illustrated.

The sinuosity and partial obliteration of the medullary processes is a principal cause of the anomalous appearances at *figs.* D, E, F, G, where they are reduced to fine lines only visible beneath a microscope, and not radiating from the centre, but disposed in no certain manner, sometimes even transversely, owing to the excessive disturbance of the wood itself. In *fig.* I, the singularity of structure is owing in part to the excessive irregularity with which the wood has been developed, and in part to the looseness and irregular shape of the medullary rays, which seem huddled as it were round the woody cords; the latter are moreover extremely variable in size, some of them being as much as half an inch in diameter, and others so small as to consist of no more than a single vessel with its usual coating of woody tissue.

The absence of concentric circles is an extremely frequent occurrence in the wood of tropical countries, and it is almost certain that many families of Exogens never form them visibly under any circumstances. We say visibly, because in fact they must be annually formed in all cases, although we do not see them. The reason why Exogens have their wood marked by concentric circles is, that the ligneous tissue formed at the end of a season is more compact than that formed at the beginning, and hence, as the two are in juxtaposition, the difference in their density distinctly separates the one from the other. But if, from any cause,—whether proper to plants as species or owing to the external influence of an equable climate—the tissue of wood formed at all seasons is exactly alike, no zone will be visible, although in fact the formation of the wood is exogenous in the most regular manner. Such cases are seen at *figs.* K, L, S, and elsewhere in the illustrations of the present article.

It is not a little remarkable however that while the wood in some cases has no trace of zones, the bark should show them most distinctly, as in the instance of *fig.* K.

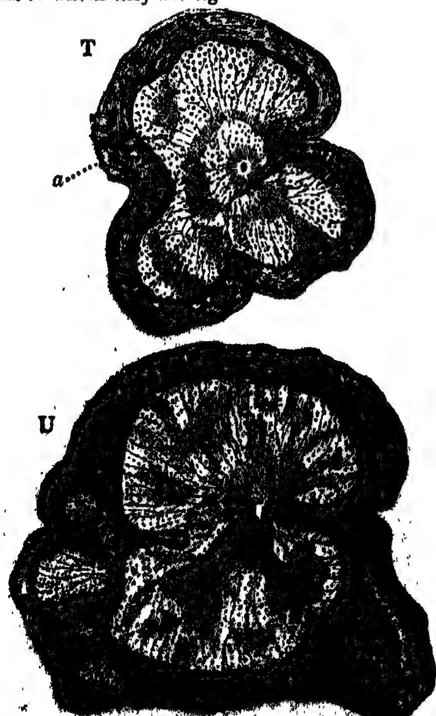
When a deep zone of cellular substance is formed between each zone of wood, a curious banded appearance is produced, as in the singular Indian climber marked N M O P Q, where extremely excentrical growth is combined with this peculiarity. At N we have the stem two years old, the second zone passing pretty regularly round the first and cut off from it by a broad deep band. At M the specimen is of the same age, but the second zone is formed on one side only.



At O the specimen is two years old, with the first zone perfect, but the second broken up into a number of unequal irregular pieces, and it would seem as if a third growth had commenced on one side (to the left of the cut). At P the growth is of three zones, both the second and third being much lobed, and the third only extending three quarters round the second. Finally, at Q, where the irregularity is the greatest, there is a growth of four zones, the first symmetrical, the second very much deeper on one side than the other, the third but half surrounding the second, and the fourth formed only along two ridges on the third.

If it happens that, in addition to the presence of a thick cellular layer between each zone, the medullary processes are also very thick, an appearance still different from the last is produced, as at *fig.* R.

That wood is sometimes formed in the bark itself has been long since shown by Mirbel, in the case of Calycanthus floridus, where four additional woody columns appear equidistant in the bark, without any separate pith, but radiating from their first line of origin. We are now acquainted with many such cases. In *fig.* T are the commencement of four such columns at *a* on one side; but in that specimen no further indication of such a structure is visible; but at *fig.* U, which is the same plant at a more advanced stage of growth, four such columns on one side and one on the other have acquired considerable size, and each radiates towards the circumference of the stem. As in the Calycanthus, so in these and in all the other instances of the same kind, which these cuts represent (see F, K, and S), the woody columns of the bark are destitute of pith.



Perhaps what we have called the separation of zones of

wood at N M O P Q R, by thick layers of cellular tissue, are rather to be considered as other instances of wood formed in bark, but in a regular and uniform manner. We are

however uncertain how this may be, and prefer allowing the statement to stand in its present form until some one shall have examined such plants in their native forests at Sincapore.

In addition to such anomalous kinds of structure as those now described, Exogens, like Endogens, contain species, the organization of whose stem is so imperfect as to be reducible within no certain rules. Not to speak of Callitriche, Ceratophyllum, or Myriophyllum, wherein vessels are scarcely developed, and the woody matter merely forms a simple central axis of growth, we have in this class an exact parallel with Lemna among Endogens; some Podostemaceous plants have their leaves and stem completely fused together so as to resemble a Marchantia or an Alga. Such plants are to be regarded rather as instances of imperfect organization than as deviations from a typical form; and it is by no means a violent supposition to conclude that if their organization were more complete it would then become such as is characteristic of the class to which they belong.

From what has now been stated it will be obvious that the most essential features of exogenous vegetation are, not concentric circles in the wood, but an arrangement of the woody matter in a circular manner round pith, its augmentation by external additions, and the universal presence of medullary processes which give the wood a radiated character. With endogenous vegetation it agrees principally in the existence of two systems of growth; one original, cellular, and capable of extending and increasing in all directions; the other perpendicular, capable of augmentation in a longitudinal direction only, and developed subsequent to the first.

In both Exogens and Endogens therefore, the one system, which we have elsewhere called the fibro-vascular, but which may also be termed the woody, lies across the other, by which it is held together, as the threads of the warp in linen are held together by the woof, as the writer of this has long since pointed out in another place. (*Introduction to Botany*, book ii., chap. 3.) This appears to be the circumstance upon which the real explanation of all the phenomena of growth in stems must necessarily turn. We find it is adopted by M. Gaudichaud in his theory of the development of stems, of which a brief notice has been published in the 'Annales des Sciences,' new series, vol. v., p. 24; and Mirbel, the reporter in the place referred to, calls it 'la pierre angulaire de la théorie.' Connected with this, however, are two other facts that require also to be rightly understood; the one, that buds are emanations of the horizontal cellular system; and the other, that roots are elongations of the descending woody system. Unless these are coupled with the first-named fact there will be no solidity in the theory of growth now about to be explained.

Keeping in view all the phenomena above referred to, it will be obvious that the origin of wood is to be sought in the action of leaves, or of buds which are collections of leaves; and the theory of the formation of wood may be thus expressed:—

1. Wood is a collection of thick-sided tubular tissue, united in different ways in different species of plants. It is usually combined with vascular tissue, but does not necessarily include that kind of tissue.
2. It is always mixed with cellular tissue; through which it passes, and which in Exogens is arranged in the form of radiating plates.
3. It proceeds downwards from the leaves to the roots; either in parallel series, as in Exogens, or in curving and intersecting lines, as in Endogens.
4. It has the power of lengthening at its lower extremity as soon as it has once been generated, without any further impulse from the leaf from which it emanated. (This undoubtedly happens by the formation of new woody tubes at the points of those previously created.)
5. It is, in fact, the nutrient system of the leaves, and may be regarded as their roots.
6. The quantity of wood in a given plant will therefore bear a direct proportion to the quantity of leaves, or to their size and vigour.
7. In general its development takes place beneath the bark or cortical integument; but it may be found within the bark itself, in which case it continues to follow the order of development proper to it in its ordinary situation.

The woody part of bark is also derived from the leaves, and may be in like manner considered a state of their roots; but the office of its tubes is excrementitious rather than nutrient.

This view of the nature of wood is much the same as that first brought to the notice of modern botanists by Du Petit Thouars, an ingenious French physiologist, who, during many years, sustained the opinion in opposition to all his countrymen. It did not however originate with him, for it had been previously taken by others, who did not persevere like himself in maintaining it against the prejudices of their day, and who, moreover, did not possess the skill and extensive acquaintance with vegetable organization requisite to sustain a theory to which so many specious objections could readily be offered. The great error committed by Du Petit Thouars, in which it is probable that the slow progress of his opinions is really to be found, was his mixing up notorious errors with the truths of his theory. He insisted, for example, that the moment leaves begin to grow, wood is formed 'with the rapidity of lightning,' in continuous threads passing from the extremities of branches to the roots: this was anatomically untrue, for the woody tissue consists of tubes adhering end to end, and not continuous; and the rapidity assigned to their development was altogether imaginary. He next insisted that new roots could not

be developed till new leaves made their appearance this was disproved by the well-known fact that newly planted deciduous trees produce roots before their leaves appear. It may be doubted moreover whether he ever understood that buds originate exclusively from cellular tissue, and roots exclusively from fibro-vascular tissue; a fact, without attending to which, there is no possibility of explaining many common phenomena, but about which we conceive there is no sort of doubt.

It is not altogether a matter of theory that wood is formed of the roots of leaves imbedded in cellular tissue in a definite manner, according to the species: on the contrary, there are many curious facts to corroborate the supposition. The leaves of *Clianthus puniceus*, and many other plants. particularly *Gesneraceæ*, emit roots when cut off the stem to which they belong, and completely separated from the bud that is axillary to them. A knowledge of some such fact probably led to the absurd speculation, insisted upon by Bradley in the beginning of the last century, of forming plantations by sticking leaves in the ground. Du Petit Thouars found that the young leaves of *Dracænas* in the Isle of France root between the rind and old wood, forming rays of which the axis of the new shoot is the centre. The case of *Pandanus* we have adverted to elsewhere (*Introd. Bot.*, ed. 2nd, p. 262); and in the article Endogens of this Cyclopædia we have given a much more striking instance from *Barbacenia*. In that plant the cuts (which it should have been stated are representations magnified about three times) show that when undoubted roots proceeding from leaves are consolidated by passing down one above the other over the surface of the stem, precisely the appearance of palm-wood is produced. This we regard as conclusive as to the true nature of endogenous wood: and it would be unphilosophical to suppose that the wood of one great class of the vegetable kingdom is formed upon one plan, and of another class upon a totally different plan.

It must be highly satisfactory to those who have embraced the opinions of Du Petit Thouars, as modified by the writer of this and by others, to find how nearly they accord with what Mirbel represents to be the ideas of Gaudichaud upon the same subject. M. Gaudichaud is one of the very few physiologists who has studied this question with reference to tropical forms of vegetation. Most others have drawn their ideas exclusively from common European trees; in doing which, with all respect be it spoken, they appear to us to have begun at the wrong end. This distinguished botanist and traveller, in an unpublished memoir for which the Montyon prize was awarded by the French Academy in 1835, is represented as having collected a great mass of admirable observations upon the embryo, the germination, the mode of growth, the stem of a considerable variety of plants, and to have particularly adverted to the important phenomena of barking, striking from cuttings, grafting, pruning, and other horticultural operations; from all which he has deduced a theory of growth which M. Mirbel states to be substantially the same as that above explained. Among other curious facts, he mentions that he possesses a specimen of a cutting of *Cissus hydrophora*, with a bud upon it from whose base proceeds a woody network which partially invests the lower portion of the old wood, and afterwards escapes on all sides as root. (*Ann. Sc. N. S.* v. 29.)

We have in the first instance stated in what manner wood is formed according to our own views of the subject. It is now requisite that we should add the views of those who differ from us. That wood derives its origin directly from the leaves in any way whatever, is denied by some, who believe that it is a superficial deposit from the previously formed wood. But as those who entertain this opinion do not explain how the *first* wood originated, that theory need not be discussed. Mirbel seems to consider that both wood and the woody part of bark are independent formations created out of the cambium; but there is no cambium when the *first* wood of Exogens is generated, and that substance never makes its appearance at all in Endogens, which ne-

EXOGENOUS VEGETATION.

vertheless form wood: we however think it may be doubted whether this is the present opinion of that great physiologist. De Candolle says, that the woody and cortical layers are formed laterally from the cambium supplied by preexisting layers, and nourished by the descending sap; but we again say that this is inapplicable to Endogens; and moreover, that it is inconceivable upon such a theory how the *first* of the woody and cortical layers originated. Besides, woody matter appears before the new leaves can be supposed to have generated descending sap: it is not probable that so heterogeneous a formation as that of the wood is a mere superficial deposit, in which case it might be expected to be homogeneous; and finally, we do not know how, upon the supposition of De Candolle, to explain in any intelligible way why wood is found in pith, and in bark, as we have already shown that it often is. It would take us too far if we were to discuss this subject at greater length; the reader is therefore referred for further information to De Candolle's *Physiologie Végétale*, p. 146; Mirbel in the *Annales des Sciences* above quoted; Henslow in the *Magazine of Zoology and Botany*, vol. i., p. 32; and to our own *Introduction to Botany*, ed. 2nd, p. 256, &c.

The age at which Exogens may arrive is closely connected with their mode of development, as already shown in this work. [AGE OF TREES.]

If Exogens are distinctly known from Endogens by their peculiar manner of growth and by the arrangement of their woody matter, they are not less clearly defined by external marks.

Their *leaves* have the veins ramifying from the midrib, or ribs if there are several, in so intricate a manner as to give the appearance of irregular net-work. Their veins never run parallel with each other without ramifications; for if, as sometimes happens, they appear to do so, it will be found that the appearance is confined to the principal veins or ribs, and that the secondary veins between them ramify in the usual way. The leaves are moreover in most cases articulated with the stem, leaving behind them a clean scar when they die, not rotting away and hanging upon the stem in the form of a ragged sheath, as is common in Endogens. Moreover, they are frequently furnished with stipules, an unusual circumstance in Endogens.

The *flowers* of Exogens are usually constructed upon a quinary type, that is, they have five sepals, five petals, and five stamens, or some power of that number, now and then they vary to a type of four, or they exceed the number five, but we very rarely find the ternary structure of Endogens present in them. If, as in Anonaceæ, Berberaceæ, and other orders, the sepals and petals follow a ternary type, the number three is lost in the stamens or the ovary. The natural order Menispermaceæ is the only one among Exogens in which the ternary type regularly pervades all the parts of the flower.

In their manner of growth they rarely resemble Endogens. The consequence of the ramification of the veins is to give their leaves a broad and rounded figure, the effect of which upon their general appearance is to produce the rounded lumpish aspect that we recognize in all the trees naturally inhabiting this country. In no known instance does the stem grow by the development of a single terminal bud; so that we never find in this class the columnar aspect of palm-trees [GYMNOSPERMS], unless the genus Theophrasta be considered an exception. Consequently, a landscape consisting of nothing but exogenous plants would resemble the imaginary scene that forms the subject of the preceding cut.

The differences between Exogens and Endogens, thus strongly marked in the stem, leaves, and flowers, are connected with others in the *embryo*. In Exogens of the common kind this organ has two lobes, held together by a minute central body, the upper end of which, between the lobes, is the plumule or rudimentary stem, the lower the radicle or rudimentary root; the lobes themselves, or cotyledons, are rudimentary leaves. This structure is readily seen in a hazel-nut or a garden-bean; the deviations from it are few and unimportant as compared with those of Endogens. Three or a greater number of cotyledons may be present in a whorl, instead of two opposite to each other. Or one of the two cotyledons may be much smaller than the other, as in Trapa; or they may be deeply lobed, as in the garden-cress. But in all these cases the deviations are obviously reconcileable with the typical character of being *dicotyledonous*.

When the embryo of an Exogen germinates, the radicle simply lengthens at its point, without having to break through the coat of the embryo; on this account Exogens have been named *exorhizal*.

The result of this examination is, that the great class of Exogens has five important, and, in some measure, independent characters, by which its limits are settled.

1. The wood is exogenous.
2. The veins of the leaves are netted.
3. The fructification is formed upon a quinary or quaternary type.
4. The embryo is dicotyledonous.
5. The germination is *exorhizal*.

Hence Exogens have received two other names in allusion to such characters; they are commonly called *Dicotyledones*, and *Exorhizæ* is another but less common appellation. Moreover, they are the *Phanerocotyledoneæ* of Agardh, the *Anthophytæ* and *Carpophytæ* of Oken's school, the *Dichorgana* of Schultz, the *Phylloblastæ* of Reichenbach; not to mention other names still more obscure.

In consequence of imperfect development, and the abortion or multiplication of parts, many deviations occur from the above characters. But as in Endogens, so in these, there is not in consequence any real difficulty in distinguishing Exogens from other plants. Suppose the stem to be so slightly formed, as in Podostemaceæ or the aquatic Haloirageæ, as not to arrive at a state in which the exogenous arrangement is perceptible, we have the dicotyledonous embryo, and the typical number of the floral organs to guide us. Let the leaves appear as scales, as in Lathræa, Orobanche, and the like; still there is the embryo or again the floral proportions. If the fructification is absolutely ternary as in Menispermaceæ, the organization of the stem, leaves, and embryo reveals the true nature of such plants. Or if the embryo is undivided, as in Cuscuta, and at the same time the veins of the leaves deficient, and all this with an incomplete formation of woody matter, then the number of parts in the flower remains to prevent our falling into error. It is therefore always to be remembered, that the limits of this great class are not exclusively determined by one single character, but by a combination of five; a part of which may be occasionally exceptional or undiscoverable.

Like all other natural assemblages, Exogens have many analogies with other parts of the vegetable kingdom. We have already adverted to the Podostemaceous order of this class representing distinctly the Pistiaceous order, or at least Lemna among Endogens. In speaking of the latter class (vol. ix., p. 398) other cases have been noticed, and we now add that Piperaceæ are distinct analogies here to the Araceæ of Endogens, Chenopodiales to Glumosæ, and possibly Menispermaceæ to Smilaceæ.

Whatever uses there may be in the vegetable kingdom are to be found in this class, which comprehends four-fifths of the natural orders, and probably not much less than the same proportion of species. Timber, in particular, is their exclusive produce, and if corn has no direct analogy in Exogens, at least a substitute for it is furnished by the potato and the cassava. To speak therefore of its useful products would be, in fact, to explain the utility of plants to man, and this we shall do in a more appropriate place. [PLANTS.]

Considering the very great numbers of Exogens,—they may be rated at 50 or 60,000 at a low computation,—it is not surprising that it should be here that the systematic botanist experiences his great difficulties. No embarrassment worth notice occurs in the arrangement of Endogens, as has already been shown; but in Exogens the difficulties are so great as to have hitherto baffled the most acute writers. We do not mean with regard to the natural orders themselves, for they are in general well understood and defined: our observation applies to a collocation of the orders, or, in other words, to the construction of groups of a secondary value which shall be as natural and as well defined as the orders themselves. In a recent enumeration we find no fewer than 231 orders of Exogens. It is obviously impracticable to study so large a number of combinations without breaking them into groups, and accordingly various methods have been proposed.

Jussieu, adopting, to a certain extent, the views of his predecessors, considered—1st, the separation of the petals; 2nd, their combination; or 3rd, their absence, of primary consequence; and adding to this, 4th, the separation of the sexes in flowers having no petals, he formed the four groups of—1st, *Polypetalous*; 2nd, *Monopetalous*; 3rd,

Apetalous; and 4th, *Diclinous* plants. The three first of these he again subdivided according as their stamens or their corolla grew under the ovary (hypogynous), upon the calyx (perigynous), or upon the ovary (epigynous); then the monopetalous epigynous group was subdivided into plants having united stamens and those having them distinct; the result being 11 classes, which were placed by Jussieu in the following order:—

			Class.
Apetalous	Stamens epigynous		1
	„ perigynous		2
	„ hypogynous		3
Monopetalous	Corolla hypogynous		4
	„ perigynous		5
	„ epigynous	anthers united	6
		anthers distinct	7
Polypetalous	Stamens epigynous		8
	„ hypogynous		9
	„ perigynous		10
Diclinous			11

This was, however, so artificial a distribution, that botanists soon found it as unsatisfactory as it was simple. Various changes have therefore been recommended from time to time, some of which are the following:—

In 1813, De Candolle, dropping the names of all Jussieu's classes, and abolishing many of them, proposed to arrange as follows the 113 orders of Exogens with which he was at that time acquainted.

			Class.
Polypetalous	Petals hypogynous (*Thalamifloræ*)		1
	Petals perigynous (*Calycifloræ*)		2
Monopetalous	Corolla perigynous	*Corollifloræ*	3
	Corolla hypogynous		4
Apetalous		(*Monochlamydeæ*)	5

Thus the classes were reduced from eleven to five, which was a defect; but those which remained were supposed to be more natural, which would have been an advantage. Five years afterwards, in his 'Regni Vegetabilis Systema Naturale,' he added the names inclosed within brackets, and he broke up the Thalamifloræ into five cohorts, but without stating what orders he arranged under them. We do not find that he ever pursued the subject farther. Since that period this great botanist has occupied himself with the special study of the natural orders, and the public has derived no advantage from his general views, which is much to be regretted.

In 1825, Professor Agardh of Lund, now bishop of Carlsbad, proposed a great change in the subordination of Exogens, retaining the principles of primary division recognized by Jussieu and De Candolle, but forming them into twenty subdivisions, defined by various characters analogous to those by which the orders themselves are circumscribed. This, we believe, is the first step of any consequence towards putting Exogens into a more natural grouping than that of Jussieu: in many respects the subdivisions are, as far as they go, unobjectionable; but they have excited scarcely any attention among systematic botanists. The necessity, however, of some better method of subordination than that of Jussieu and De Candolle has become evident to everybody; and attempts have been made to effect this by Drs. Bartling, Schultz, Von Martius, and others on the continent, and by the author of the present article; not to mention certain transcendental German writers, whose views, as we do not understand them, we will not attempt to explain. In our own arrangement the class is first broken into the Polypetalous, Monopetalous, and Incomplete *subclasses;* the latter are next distributed in *groups;* and finally, the groups themselves have a subordination of *alliances*, beneath which the orders are disposed in numbers varying from 1 to 8 or more, the general result being 17 groups or 89 alliances. The following table will show upon what principle the groups and alliances have been constructed. It will be remarked that the terminations of the names express their value; the groups or highest combinations end in *osæ;* the alliances, or combinations of a lower kind, in *ales;* the orders in *aceæ;* the suborders in *eæ*.

EXOGENS.

Table of Groups.

Subclass 1. Polypetalæ.

	Groups.
Albumen very considerably larger than the minute embryo.	ALBUMINOSÆ.
Albumen absent, or only forming a layer between the embryo and the seed-coat.	
Ovary inferior (often with an epigynous disk).	EPIGYNOSÆ.
Ovary superior.	
Placentæ parietal.	PARIETOSÆ.
Placentæ in the axis.	
Calyx dislocated.	CALYCOSÆ.
Calyx complete; its parts being all on the same plane.	
Carpels united in a solid pistil, parallel with each other.	SYNCARPOSÆ.
Carpels oblique, upon a gynobase.	GYNOBASEOSÆ.
Carpels disunited.	APOCARPOSÆ.

Subclass 2. Incompletæ (or Apetalæ).

Calyx altogether absent.	ACHLAMYDOSÆ.
Calyx present.	
Embryo curved round albumen.	CURVEMBRYOSÆ.
Embryo straight.	
Stamens monadelphous.	COLUMNOSÆ.
Stamens distinct.	
Calyx tubular, often resembling a corolla.	TUBIFEROSÆ.
Calyx very imperfect.	RECTEMBRYOSÆ.

Subclass 3. Monopetalæ.

Fruit consisting of but one perfect carpel.	AGGREGOSÆ.
Fruit of several carpels.	
Ovary inferior.	EPIGYNOSÆ.
Ovary superior.	
Carpels three or more.	POLYCARPOSÆ.
Carpels only two.	
Fruit nucamentaceous.	NUCAMENTOSÆ.
Fruit capsular.	DICARPOSÆ.

The orders are disposed under their several alliances in the following sequences.

Table of Alliances and Orders.

Subclass 1. Polypetalæ.

Group 1. ALBUMINOSÆ.

Alliance 1. Ranales. *Herbaceous plants; either with the carpels more or less distinct, or, if that is not the case, with parietal placentæ.* Ranunculaceæ, Podophylleæ, Papaveraceæ, Fumarieæ, Nymphæaceæ, Hydropeltideæ, Nelumbiaceæ, Cephalotaceæ, Droseraceæ.

Alliance 2. Anonales. *Woody plants, with distinct carpels, which are sometimes confluent. Anther-valves opening longitudinally.* Myristicaceæ, Magnoliaceæ, Winteraceæ, Anonaceæ, Schizandreæ, Dilleniaceæ.

Alliance 3. Umbellales. *Flowers umbellate. Calyx superior. Carpels one-seeded. Stem hollow.* Apiaceæ, Araliaceæ.

Alliance 4. Grossales. *Flowers never in umbels. Calyx superior. Carpels many-seeded. Stem solid.* Grossulaceæ, Escalloniaceæ, Bruniaceæ.

Alliance 5. Berberales. *Anthers bursting by recurved valves.* Berberaceæ.

Alliance 6. Pittosporales. *Calyx inferior. Carpels consolidated; style single.* Vitaceæ, Pittosporaceæ, Olacaceæ, Francoaceæ, Sarraceniaceæ.

Group 2. EPIGYNOSÆ.

Alliance 1. Onagrales. *Corolla not valvate. Placentæ central. Type of flowers binary throughout. Herbs.* Onagraceæ, Circæeæ, Halorageæ, Hydrocaryes.

Alliance 2. Myrtales. *Corolla not valvate. Placentæ central. Type of flowers not binary throughout Shrubs or trees.* Combretaceæ, Alangiaceæ, Rhizophoraceæ, Memecylaceæ, Melastomaceæ, Myrtaceæ, Barringtonieæ, Lecythidaceæ, Philadelphaceæ.

Alliance 3. Cornales. *Corolla valvate.* Hamamelaceæ, Cornaceæ, Helwingiaceæ, Loranthaceæ.

Alliance 4. Cucurbitales. *Placentæ parietal.* Cucurbitaceæ, Loasaceæ, Cactaceæ, Homaliaceæ.

Alliance 5. Ficoidales. *Petals indefinite.* Mesembryaceæ.

Alliance 6. Begoniales. *Flowers unisexual. Placentæ central.* Begoniaceæ.

Group 3. PARIETOSÆ

Alliance 1. Cruciales. *Embryo curved. Albumen none.* Brassicaceæ or Cruciferæ, Capparidaceæ, Resedaceæ.
Alliance 2. Violales. *Embryo straight. Stamens definite; none sterile.* Violaceæ, Sauvagesieæ, Samydaceæ, Moringaceæ, Frankeniaceæ.
Alliance 3. Passionales. *Embryo straight. Stamens definite; the sterile ones in a separate ring.* Passifloraceæ, Papayaceæ, Flacourtiaceæ, Malesherbiaceæ, Turneraceæ.
Alliance 4. Bixales. *Stamens indefinite; sterile none. Leaves dotted.* Bixaceæ.

Group 4. CALYCOSÆ.
Alliance 1. Guttales. *Stamens indefinite. Albumen none. Petals and sepals equal in number.* Clusiaceæ or Guttiferæ, Canelleæ, Rhizobolaceæ, Marcgraaviaceæ, Hypericaceæ, Ochrantheæ.
Alliance 2. Theales. *Stamens indefinite. Albumen none. Petals and sepals unsymmetrical, passing one into the other.* Ternstromiaceæ.
Alliance 3. Acerales. *Stamens definite. Flowers unsymmetrical.* Aceraceæ, Sapindaceæ, Millingtonieæ, Æsculaceæ, Polygalaceæ, Vochyaceæ.
Alliance 4. Cistales. *Flowers symmetrical. Albumen present.* Elatinaceæ, Linaceæ, Hugoniaceæ, Chlenaceæ, Cistaceæ, Reaumuriaceæ.

Group 5. SYNCARPOSÆ.
Alliance 1. Malvales. *Calyx valvate. Carpels* 4 *or more. Stamens monadelphous more or less.* Sterculiaceæ, Malvaceæ, Elæocarpaceæ, Dipteraceæ, Tiliaceæ, Lythraceæ (?)
Alliance 2. Meliales. *Calyx imbricated. Carpels* 4 *or more. Stamens usually monadelphous.* Meliaceæ, Cedrelaceæ, Humiriaceæ, Aurantiaceæ, Spondiaceæ.
Alliance 3. Rhamnales. *Calyx valvate. Carpels fewer than* 4. *Shrubs.* Rhamnaceæ, Chailletiaceæ, Tremandraceæ, Nitrariaceæ, Burseraceæ.
Alliance 4. Euphorbiales. *Calyx imbricated. Carpels fewer than* 4. Euphorbiaceæ, Empetraceæ, Stackhousiaceæ, Fouquieraceæ, Celastraceæ, Hippocrateæ, Trigonieæ, Staphyleaceæ, Malpighiaceæ, Erythroxyleæ.
Alliance 5. Silenales. *Embryo rolled round albumen; or joints of stem tumid; or leaves minute and scale-like.* Silenaceæ, Alsinaceæ, Tamaricaceæ (?), Illecebraceæ.

Group 6. GYNOBASEOSÆ.
Alliance 1. Rutales. *Style single, or leaves marked with pellucid dots.* Ochnaceæ, Simarubaceæ, Rutaceæ, Zygophyllaceæ, Xanthoxylaceæ.
Alliance 2. Geraniales. *Styles distinct. Ovary consolidated. Stamens hypogynous.* Geraniaceæ, Vivianiaceæ, Balsaminaceæ, Tropæoleæ, Oxalidaceæ, Ledocarpeæ.
Alliance 3. Coriales. *Styles and carpels both distinct.* Coriariaceæ, Surianaceæ.
Alliance 4. Flörkeales. *Styles single. Fruit lobed. Stamens perigynous.* Limnanthaceæ.

Group 7. APOCARPOSÆ.
Alliance 1. Rosales. *Albumen wholly absent.* Rosaceæ, Pomeæ, Amygdaleæ, Sanguisorbeæ, Fabaceæ or Leguminosæ, Cæsalpinieæ, Mimoseæ, Connaraceæ, Chrysobalanaceæ, Calycanthaceæ.
Alliance 2. Saxales. *Carpels two, diverging at the end, many-seeded. Albumen present.* Baueraceæ, Cunoniaceæ, Saxifragaceæ.
Alliance 3. Crassales. *Carpels several, distinct, continuous with the styles. Seeds indefinite. Albumen.* Crassulaceæ.
Alliance 4. Balsamales. *Carpels neither two, nor divergent, nor numerous, with hypogynous scales. Leaves and bark balsamic.* Amyridaceæ, Anacardiaceæ.

Sub-class 2. Incompletæ.

Group 1. RECTEMBRYOSÆ.
Alliance 1. Amentales. *Catkins. Carpels two or more, combined. Trees or shrubs.* Corylaceæ or Cupuliferæ, Betulaceæ, Scepaceæ.
Alliance 2. Urticales. *Carpels solitary or syncarpous. Stems continuous, without sheaths. Never a cupule.* Garryaceæ, Helwingiaceæ, Trewiaceæ, Urticaceæ, Ceratophylleæ, Ulmaceæ, Stilaginaceæ, Myricaceæ, Juglandaceæ.
Alliance 3. Casuarales. *Carpels solitary. Stems jointed and with sheaths.* Casuaraceæ.
Alliance 4. Datiscales. *Carpels several. Seeds numerous. Leaves alternate.* Datiscaceæ, Lacistemaceæ.

Group 2. ACHLAMYDOSÆ.
Alliance 1. Piperales. *Carpels solitary or distinct. Flowers in spikes. Embryo minute, in the base of fleshy albumen.* Chloranthaceæ, Saururaceæ, Piperaceæ.
Alliance 2. Salicales. *Flowers amentaceous. Fruit mostly many-seeded; when one-seeded, in globular heads.* Salicaceæ, Platanaceæ, Balsamaceæ.
Alliance 3. Monimiales. *Flowers within an involucre. Sexes distinct.* Monimiaceæ, Atherospermaceæ.
Alliance 4. Podostemales. *Flowers solitary. Carpels two or three, combined. Seeds numerous and minute.* Podostemaceæ.
Alliance 5. Callitrichales. *Carpels several, combined, single-seeded. Floaters.* Callitrichaceæ.

Group 3. TUBIFEROSÆ.
Alliance 1. Santalales. *Calyx superior. Anthers opening longitudinally.* Santalaceæ.
Alliance 2. Daphnales. *Calyx inferior, imbricated. Carpel solitary. Anthers opening longitudinally.* Elæagnaceæ, Thymelaceæ, Hernandiaceæ, Aquilariaceæ.
Alliance 3. Proteales. *Calyx valvate. Stamens opposite its lobes. Fruit simple, follicular.* Proteaceæ.
Alliance 4. Laureales. *Anthers opening by valves. Carpels solitary, superior, or inferior.* Lauraceæ, Illigeraceæ, Cassythaceæ.
Alliance 5. Penæales. *Carpels several. Calyx imbricated or valvate.* Penæaceæ.

Group 4. COLUMNOSÆ.
Alliance 1. Nepenthales. *Diœcious. Ovary superior.* Nepenthaceæ.
Alliance 2. Aristolochiales. *Hermaphrodite. Ovary inferior.* Aristolochiaceæ.

Group 5. CURVEMBRYOSÆ.
Alliance 1. Chenopodiales. *Albumen. Radicle next the hilum.* Amarantaceæ, Chenopodiaceæ, Tetragoniaceæ, Phytolaccaceæ.
Alliance 2. Polygonales. *Albumen. Radicle remote from hilum.* Polygonaceæ.
Alliance 3. Petiveriales. *Albumen* 0. *Cotyledons spiral.* Petiveriaceæ.
Alliance 4. Sclerales. *Tube of calyx hardened.* Scleranthaceæ, Nyctaginaceæ.
Alliance 5. Cocculales. *Albumen. Flowers ternary. Calyx in two rows.* Menispermaceæ, Lardizabaleæ.

Sub-class 3. Monopetalæ.

Group 1. POLYCARPOSÆ.
Alliance 1. Brexiales. *Albumen* 0. *Carpels five. Sterile stamens between fertile ones. Seeds indefinite.* Brexiaceæ.
Alliance 2. Ericales. *Anthers porous. Carpels four, five, or more.* Pyrolaceæ, Monotropaceæ, Ericaceæ, Vaccinaceæ, Epacridaceæ.
Alliance 3. Primulales. *Anthers opening longitudinally. Carpels four or five. Fruit often one-celled.* Primulaceæ, Myrsinaceæ, Sapotaceæ, Ebenaceæ, Styraceæ, Aquifoliaceæ.
Alliance 4. Nolanales. *Fruit lobed.* Nolanaceæ.
Alliance 5. Volvales. *Carpels two—four, combined. Anthers never porous.* Convolvulaceæ, Cuscutaceæ, Polemoniaceæ, Diapensiaceæ, Hydroleaceæ.

Group 2. EPIGYNOSÆ.
Alliance 1. Campanales. *Stipules none. Seeds indefinite.* Lobeliaceæ, Campanulaceæ, Sphenocleaceæ?, Belvisiaceæ, Columelliaceæ, Stylidiaceæ.
Alliance 2. Goodeniales. *Stigma with an indusium.* Goodeniaceæ, Scævolaceæ.
Alliance 3. Cinchonales. *Stipules between the leaves.* Cinchonaceæ, Lygodysodeaceæ.
Alliance 4. Capriales. *Stipules none. Leaves opposite. Seeds definite.* Caprifoliaceæ.
Alliance 5. Stellales. *Fruit didymous. Leaves whorled. Stipules none. Stem angular.* Galiaceæ, or Stellatæ.

Group 3. AGGREGOSÆ.
Alliance 1. Asterales or Compositæ. *Anthers syngenesious. Ovary inferior.* Calyceraceæ, Mutisiaceæ, Cichoraceæ, Asteraceæ, Cynaraceæ.

Alliance 2. Dipsales. *Anthers distinct. Ovary inferior.* Dipsaceæ, Valerianaceæ.

Alliance 3. Brunoniales. *Ovary superior. Stigma with an indusium.* Brunoniaceæ.

Alliance 4. Plantales. *Ovary superior. Stigma naked. Style single.* Plantaginaceæ, Globulariaceæ, Salvadoraceæ.

Alliance 5. Plumbales. *Ovary superior. Stigmas naked. Styles five.* Plumbaginaceæ.

Group 4. NUCAMENTOSÆ.

Alliance 1. Phaceliales. *Fruit capsular. Inflorescence gyrate.* Hydrophyllaceæ.

Alliance 2. Echiales. *Fruit nucamentaceous. Inflorescence gyrate. Flowers symmetrical.* Cordiaceæ, Ehretiaceæ, Boraginaceæ.

Alliance 3. Labiales. *Fruit nucamentaceous. Flowers unsymmetrical.* Lamiaceæ or Labiatæ, Verbenaceæ, Myoporaceæ, Selaginaceæ, Stilbaceæ.

Group 5. DICARPOSÆ.

Alliance 1. Bignoniales. *Flowers didynamous. Seeds winged. Albumen none. Calyx complete.* Pedaliaceæ, Bignoniaceæ, Cyrtandraceæ.

Alliance 2. Acanthales. *Flowers didynamous. Seeds adhering to hooks, not winged. Albumen none. Calyx dislocated.* Acanthaceæ.

Alliance 3. Lentibales. *Flowers subdidynamous. Fruit with a free central placenta.* Lentibulaceæ.

Alliance 4. Scrophulales. *Flowers didynamous. Albumen. Placenta parallel with axis.* Gesneraceæ, Orobanchaceæ, Scrophulariaceæ.

Alliance 5. Solanaceæ. *Flowers symmetrical. Albumen. Placenta parallel with the axis.* Solanaceæ, Cestraceæ.

Alliance 6. Gentianales. *Flowers symmetrical, tetrandrous or pentandrous. Placenta perpendicular to axis. Seeds often winged. Leaves opposite.* Gentianaceæ, Spigeliaceæ, Apocynaceæ, Asclepiadaceæ.

Alliance 7. Loganiales. *Flowers unsymmetrical. Stamens never two. Leaves always opposite.* Loganiaceæ, Potaliaceæ.

Alliance 8. Oleaceæ. *Flowers regular, unsymmetrical, diandrous.* Oleaceæ, Jasminaceæ.

We shall not be restrained by false delicacy from criticising this arrangement freely, with reference to its merits as well as its demerits. We will therefore at once say, that in several respects it is a decided advance in the grouping of the orders. By abandoning the artificial distinction of perigynous and hypogynous insertion, many orders naturally allied are brought into contact. The great mass of Polypetalous Exogens is analysed with tolerable precision; a great many of the alliances are, as far as we can discover, unobjectionable; and we can state, from the experience of four years' personal use, that the scheme is of great utility to students, in consequence of the power it gives them of combining the orders. The albuminous group in particular, although incompletely made out, may be regarded as an important elimination of orders which often had no obvious relation to any with which they were previously associated. It cannot be considered otherwise than a striking physiological peculiarity, that while the greater number of Exogens have an embryo so robust as to be able to spring at once into existence, and from the very beginning of its life capable of trusting to the atmosphere and the earth for its support, there should be others, and many of them among the most highly organized races, which are so feeble and puny in the beginning as to require from nature a large and abundant store of nutritive matter upon which they may feed until strong enough to contend with the elements among which they must eventually live. These latter form the albuminous group. Albumen occurs very often in other groups; but in such small quantity that it may be regarded as a mere residuum of the nutrient mucilage in which the embryo was originally developed, rather than a store of food provided for the young plant when it enters upon its first stage of growth. Among the former the presence or absence of albumen is of little or no consequence; Fabaceæ for example, and other equally well defined groups, possess it in some species, and want it in others. But in the orders collected in the albuminous group, its presence and its great disproportion to the embryo are identified with the reproduction of the species, and there is no instance known of its absence, except in Nelumbiaceæ, in which, if they really belong to the group, it may be supposed that the usual function of the albumen is performed by the excessively thickened cotyledons.

But, on the other hand, this system has defects in abundance; so many indeed, that we should say they outweighed its advantages, if they were not fully participated in by all other similar schemes; from a respect for which they have indeed been to a great extent produced. Among minor blemishes may be named the artificial collocation of the genera in some of the alliances, as, for example, the Passional, the Silenal, the Euphorbial, and the Primulal. In the next place, the alliances are excessively multiplied; as in the case of the Cinchonal, Caprial, and Stellal, of the Chenopodial, Petiverial, and Scleral, or of the Geranial and the Flörkeal; this however is a fault on the right side. Of much more consequence is the indefinite character of the Parietous and Gynobaseous groups. The first depends upon a distinction which sometimes exists in the fruit and not in the ovary of the same plant, and which may be destroyed by either the contraction or extension, in a slight degree, of the dissepiments: moreover, the orders collected under it, although to a certain extent naturally combined, yet in other instances, as Bixaceæ, Turneraceæ, Moringaceæ, and the whole Crucial alliance, agree less with each other than with other parts of the system. The Gynobaseous group is much more natural; that indeed is its merit; but the gynobasic character, strongly marked as it is in Geraniaceæ and many of the Rutal alliance, is, it must be confessed, too feeble to deserve to be considered of more than very subordinate importance; in fact, many of the Syncarpous group are gynobasic—Malva, for example. Then, among Monopetalæ, the Dicarpous and Nucamentous groups are not distinguishable, and should have been combined; each however is natural as far as it goes.

The great vice of the arrangement however is that which it owes to the adoption of the old practice of considering Polypetalæ, Monopetalæ, and Apetalæ, fundamental divisions. Every systematical writer at all known, down to the present time, has adopted them; so that their value has become a matter of prejudice, which it will be no easy task to remove from the minds of those who have all their lives been accustomed to look at botanical classifications in one and the same point of view. We will nevertheless attempt to show, firstly, that these divisions are essentially bad; and secondly, that a great advantage will be derived from their rejection. The Monopetalous sub-class depends entirely upon the circumstance of the petals adhering to each other by their edge; it has no accessory characters whatever to sustain it. Now the partial adhesion of contiguous organs is of no greater than ordinal importance when it takes place in other parts of the fructification, and is often not of so much. The sepals adhere or remain separate in the very same natural order, Urticaceæ and Chenopodiaceæ for example. The stamens adhere into a tube, and this sometimes gives a character to certain orders, but more often is a mere distinction of genera, as in Euphorbiaceæ, Iridaceæ, Aristolochiaceæ, &c. When the carpels unite and form a multiplex fruit, the ovaries, style, and stigma, being altogether consolidated, that character becomes of considerable value as contrasted with the complete or partial separation of the carpels, because it is found constant; and hence it has been employed by us as a distinction of a portion of the group of Polypetalæ. But we are persuaded that we have assigned it too high a value, and that it is only one degree better than an ordinal distinction. It is therefore improbable that the adhesion of the petals, organs not even essential to the fructification, but which may be wholly absent without the great functions of impregnation and reproduction being interfered with, should be of greater importance. The monopetalous corolla is not considered of any value in Endogens, even as an ordinal character, and nothing can justify our considering it of primary value among Exogens, except the constant and unvarying existence of that character throughout certain natural orders more nearly related to each other than to anything else. It will be found however upon strict inquiry, firstly, that the character is anything but constant, except in a portion of the Monopetalous sub-class; and secondly, that it combines dissimilar orders, separating them widely from their true affinities.

That the Monopetalous character is not constant hardly requires proof, so notorious is its instability. Pyrolaceæ, Monotropaceæ, Ericaceæ, Myrsinaceæ, Lobeliaceæ, Campanulaceæ, Plumbaginaceæ, and Oleaceæ, all offer instances of the polypetalous structure; and some Primulaceæ, Ole-

aceæ, and Monotropaceæ, are even apetalous; while on the other hand Rutaceæ, Anonaceæ, Stackhousiaceæ, Fouquieraceæ, Crassulaceæ, Loranthaceæ, Cucurbitaceæ, Cactaceæ, Papayaceæ, and many other natural orders, stationed in Polypetalæ, because of their affinity, are either partially or wholly Monopetalous. The Monopetalous character cannot then be defended because of its stability. Moreover, nothing can well be more arbitrary than the language of botanists in speaking of the corolla. In Delphinium, Trifolium, and many other plants, the corolla has all its petals in a state of adhesion; the same thing occurs in Loranthaceæ, and yet these are called Polypetalous. Still more strange is it that Malvaceæ, which have the petals adhering to the tube of the stamens, should be called Polypetalous, while Styraceæ, having precisely the same organization, are accounted Monopetalous.

It will also be found that the Monopetalous character is equally objectionable as a means of combining similar natural orders. So far is it, except in the case of the Dicarpous and Nucamentous groups, from complying with the conditions to be required of all characters employed for purposes of co-ordination, namely, combining genera more nearly allied to each other than to any thing else, that in fact it disunites plants closely akin, and interrupts series that would be otherwise as complete as series can be in the arrangement of living beings; as will be apparent from the following statement.

Pyrolaceæ and Monotropaceæ have a minute embryo, a large mass of albumen, a tendency to become leafless and parasitical, and in all their habits are at variance with the rest of Ericales.————The latter have no direct connection with any other Monopetalous order, but have all their affinities turning towards Rutaceæ, as is proved by Correa, Phebalium, and other genera.————Primulaceæ and Myrsinaceæ, with their large horny albumen, approach Cinchonales, and together with that, the Caprial and the Stellal alliances seem rather to belong to the Albuminous group.————Ebenaceæ and Aquifoliaceæ have an affinity with Myrsinaceæ. Dr. Royle has pointed out a connection between Ebenaceæ and Clusiaceæ; Adolphe Brongniart has shown that Aquifoliaceæ must stand near Ebenaceæ; and with regard to Styraceæ, Jussieu actually referred them to the polypetalous Meliaceæ, and De Candolle considers them nearly akin to Ternstromiaceæ.————Whatever the affinity of the Nolanal and Volval alliances may be, it is clear that in taking away the orders already mentioned, they will remain isolated among orders to which they have no direct relation. It will be seen that they fall naturally into their places in a re-distribution of Exogens upon other principles.————Columelliaceæ must be looked upon as a monopetalous form of Onagraceæ, and will connect the Campanal and Goodenial alliances with the series to which Onagraceæ belong.————The Cinchonal, Caprial, and Stellal alliances, which ought to be combined, are so closely united with Apiaceæ among Albuminosæ, that they may be naturally transferred to that group. Even De Candolle has found it necessary to approximate them by stationing Apiaceæ near the end of his polypetalous sub-class, and Cinchonaceæ near the beginning of his Monopetalæ. The connection of Apocynaceæ with these plants is perhaps more apparent than real.————Asterales and Dipsales necessarily follow the affinity of the Campanal alliance. ————The Brunonial, Plantal, and Plumbal alliances may be considered more properly analogous than allied to Asterales, and have no affinity of an obvious kind with any other monopetalous orders.————All the other orders are well combined, with the exception of Orobanchaceæ; the affinity of that order with Scrophulariaceæ and the remainder of the dicarpous group is extremely problematical. It has not, so far as we are aware, been before observed that the carpels in that order are right and left of the axis, and not anterior and posterior; a very important circumstance, which so much weakens its supposed affinity with Scrophulariaceæ as to remove many objections to its separation into a distinct part of the system. But if on the other hand we look to the aristate base of the anthers in Orobanche, the extreme resemblance of that genus to Monotropoceæ in habit, and the remarkable similarity between its placentation and that in the upper half of the ovary of Monotropa, to say nothing of its capitate stigma and calyx, the number of whose parts is at variance with that of the corolla, we incline to think that these two orders are more closely allied than they are usually supposed to be.

With regard to the Apetalous sub-class, it is even more objectionable than the Monopetalous. There is no end to the instances of Polypetalous orders being Apetalous; and in Thymelaceæ, Menispermaceæ, Polygonaceæ, and a few others, the denial of the presence of petals in particular genera is a mere arbitrary use of words. Many Apetalæ appear, in fact, to be imperfect forms of Polypetalous groups, and will naturally arrange themselves in the same series with what may be supposed to be their more perfect types. Piperales seem a degraded state of Anonales, Penæales of Onagrales, Daphnales and their allies of Rhamnales. But a large proportion of the Apetalous orders undoubtedly require to be located separately. They have distinct sexes and a peculiar habit, and must be considered a quite distinct group, as Jussieu originally stated them to be.

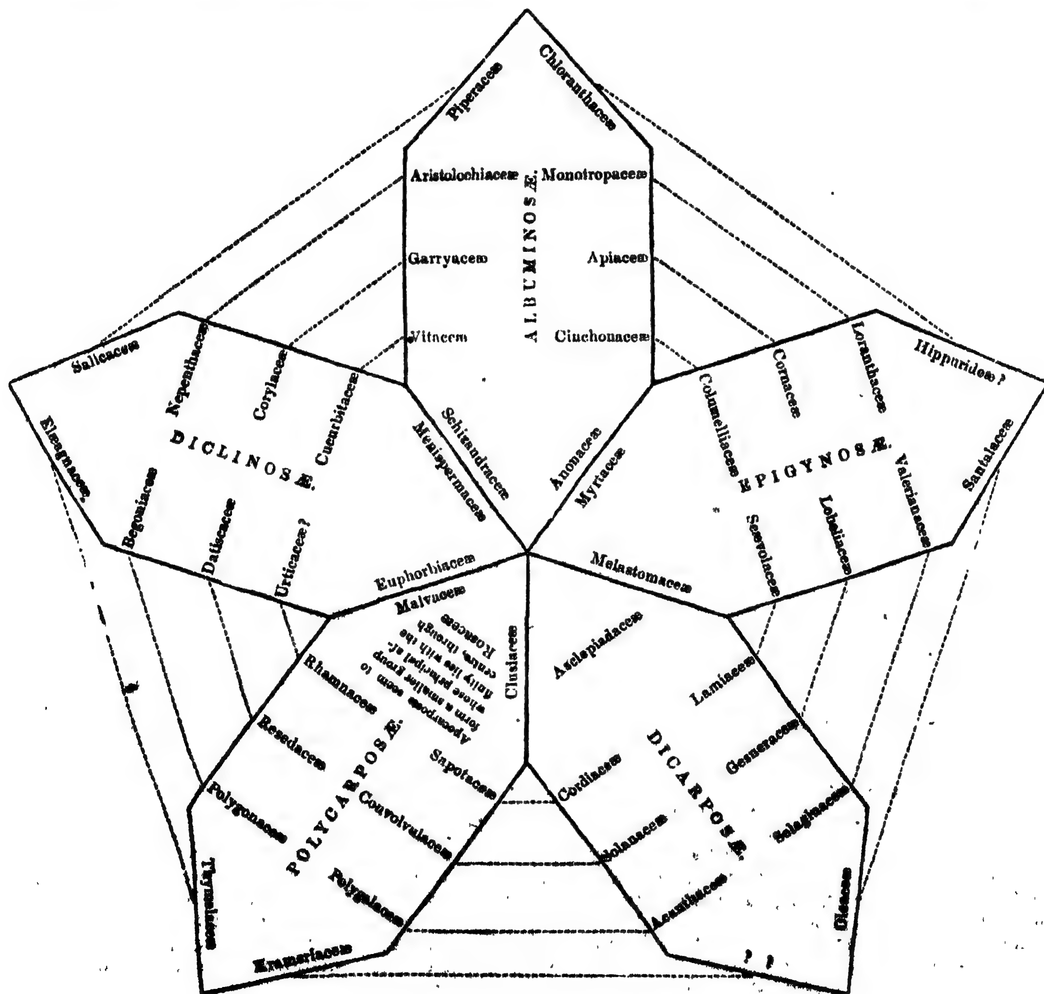
Having thus shown how unsatisfactory are the principles hitherto employed for classifying Exogens, we next proceed to show in what way it appears to us they may be arranged in a more natural and precise manner; the Polypetalous, Monopetalous, and Apetalous sub-classes being altogether abandoned.

In the first place, there are the orders whose embryo is, as has already been stated, furnished with an excessive quantity of albumen. This, as a great physiological distinction, may be considered to supersede all others, and to establish an *Albuminous* group.——The remainder consists of orders in which some have the sexes in distinct flowers, others combined with hermaphrodite flowers. We know of no character intimately connected with the reproduction of the species which is upon the whole so important as this; indeed, if it were not for the frequent occurrence of polygamous flowers throughout hermaphrodite orders, we should assign it a higher place than even the albuminous character; but the constant tendency of hermaphrodite flowers to become polygamous leads us necessarily to look upon sexuality as a secondary character only, especially since, if it were taken as a primary one, it would have the unnatural effect of separating Myristicaceæ and Schizandreæ from Anonales. For this reason a *Diclinous* group may be formed, into which nothing should be admitted except plants without any tendency to hermaphroditism.——The hermaphrodite orders may be separated into those with the calyx, corolla, and stamens confluent at the base with each other and with the ovary, that is, having an inferior ovary, and those in which those parts are distinct, either altogether or at least from each other: the former will constitute an *Epigynous* group.——Finally, the remainder of the orders may be divided into those with a monopetalous corolla combined with an ovary upon a binary plan (*Dicarpous*), and those which, if monopetalous, have the ovary simple or complex (*Polycarpous*).

The following table will put this in a clearer point of view.

Albumen extremely abundant; embryo minute	1. ALBUMINOSÆ.
Albumen absent, or in small quantity.	
Sexes in the same flower.	
Ovary inferior. . .	2. EPIGYNOSÆ.
Ovary superior.	
Flowers, if monopetalous, not with a bicarpellary ovary .	3. POLYCARPOSÆ.
Flowers monopetalous, with a bicarpellary ovary . .	4. DICARPOSÆ.
Sexes in different flowers • .	5. DICLINOSÆ.

Each of these groups will form a series by itself, the sequence of which ought to be natural, and to exhibit various lateral analogies with other groups. Possibly each group will comprehend within itself a maximum, a medium, and a minimum type of structure, the second being typical of the group, the first an exaggerated form of it, and the last a degraded form. This at least may be traced in the classes of Exogens, Endogens, and Acrogens; it frequently occurs in natural orders, is not uncommon in genera, and therefore may be expected in groups.



It is scarcely possible to undertake a more difficult task than that of disentangling and settling the perplexed and complicated web of natural affinities. Every order may be compared with so many other orders in one respect or another, and the value of characters is, as far as we yet know, so very unsettled, that the most skilful and experienced botanist is perpetually embarrassed at determining the fundamental question of which orders have more relation to each other than to anything else. Viewed in one direction, the subject has one aspect, from another position it often seems quite changed. We have no certain test by

which affinity and analogy can be distinguished; and moreover, it is a most difficult thing to divest the mind of the prejudices that inevitably result from a long habit of thinking erroneously.

Nevertheless, in spite of all such obstacles, Truth is surely to be found; and when found, she will prove most richly worth the labour bestowed in searching for her. One great and immediate advantage that may be expected from a discovery of the true method of arranging exogens according to their real affinities will be a great simplification of the subject; and the extent to which this seems to be effected by the plan now proposed is much in favour of its being at least an approach to a discovery of the secret we are in search of. We will not here undertake to re-arrange all the orders already named according to the method now suggested; but the following table will serve to show that each of the five groups now proposed does exhibit distinct lateral analogies between its own series of orders and those of the groups standing next it.

ALBUMINOSÆ.	EPIGYNOSÆ.	DICARPOSÆ.	POLYCARPOSÆ.	DICLINOSÆ.
Anonaceæ	Myrtaceæ		Clusiaceæ	Menispermaceæ
Schizandraceæ	Melastomaceæ	Asclepiadaceæ	Malvaceæ	Euphorbiaceæ
Cinchonaceæ	Columelliaceæ	Cordiaceæ	Sapotaceæ	Cucurbitaceæ
Apiaceæ	Cornaceæ	Solanaceæ	Convolvulaceæ	Corylaceæ
Vitaceæ	Scævolaceæ	Lamiaceæ	Rhamnaceæ	Urticaceæ?
Monotropaceæ	Loranthaceæ	Acanthaceæ	Polygalaceæ	Nepenthaceæ
Garryaceæ	Lobeliaceæ	Gesneraceæ	Resedaceæ	Datiscaceæ?
Aristolochiaceæ	Valerianaceæ	Selaginaceæ	Polygonaceæ	Begoniaceæ
Piperaceæ	Santalaceæ	Oleaceæ	Thymelaceæ	Elæagnaceæ
Chloranthaceæ	Hippurideæ	?	Kramericeæ?	Salicaceæ.

Of course it is to be supposed that many of the orders or alliances introduced into this table are separated from those now placed next them by many, sometimes a great number of intervening orders, and that in fact what stands on paper as a series is an intricate combination of crossing and interfering analogies and affinities, which could only be expressed correctly by rays diverging from a common centre and intersecting or striking other rays of other centres, the points of intersection being what we call analogies. No diagram can exhibit these otherwise than very imperfectly; nevertheless, as it does show them better than mere lines of words, we have introduced into the following plan the analogous orders comprehended in the preceding table. The orders collected around the centre are all in close relation, and exhibit in their own series a degree of organization equivalent to what occurs at the same point in other series; those at the points of the rays of the diagram correspond in like manner with the other points; and the orders stationed along the sides of each ray are places at which the rays are laterally analogous; while the orders themselves are in direct affinity with each other through other orders not included in the diagram.

That these groups are all perfect in themselves, or nearly so, is sufficiently proved by Albuminosæ, the sequence of whose orders may be expressed as follows; the orders included in the diagram being marked with *.

1 *Anonales.* Magnoliaceæ
Winteraceæ
Dilleniaceæ
Berberaceæ
*Anonaceæ
Menispermaceæ
Atherospermaceæ
Myristicaceæ
*Schizandraceæ

2 *Ranales.* Nymphæaceæ
Hydropeltideæ
Nelumbiaceæ
Ranunculaceæ
— Podophylleæ
Papaveraceæ
— Fumarieæ
Francoaceæ (?)
Sarraceniaceæ
Cephalotaceæ
Droseraceæ

3 *Primulales.* Primulaceæ
Myrsinaceæ
Ebenaceæ?
Aquifoliaceæ?

4 *Gentianales.* Apocynaceæ
Spigeliaceæ
Gentianaceæ

5 *Loganiales.* Loganiaceæ
Potaliaceæ

6 *Cinchonales.*	Caprifoliaceæ	10 *Lathræales.*	Pyrolaceæ
	*Cinchonaceæ		*Monotropaceæ
	Lygodysodeaceæ (?)		Orobanchaceæ
	Galiaceæ	?	?
7 *Umbellales.*	*Apiaceæ	11 . . .	*Garryaceæ
	Araliaceæ	12 . . .	*Aristolochiaceæ
8 *Pittosporales.*	*Vitaceæ		
	Olacaceæ	13 *Piperales.*	*Piperaceæ
	Pittosporaceæ		Saururaceæ
9 *Grossales.* .	Grossulaceæ		*Chloranthaceæ.
	Bruniaceæ		
	Escalloniaceæ		

If we should find it necessary to recur to this subject, we shall do so when speaking of NATURAL ORDERS.

EXORCISM, (*ἐξορκισμός*) the form of adjuration, or charging upon oath, by which evil and malignant spirits are subjected to command, or driven away: from the Greek *exorkizen* (*ἐξορκίζειν*). See Joannis Wieri, *De Præstigiis Dæmonum et incantationibus ac veneficiis Libri* v., 8vo., Bas. 1566 and 1583; and the *Manuale Exorcismorum*, by Maximilian ab Eynatten, 8vo., Antw., 1619.

EXORHIZÆ. [EXOGENS.]

EXOTERIC and **ESOTERIC** (*ἐξωτερικός* and *ἐσωτερικός*), literally 'external' and 'internal,' were two terms used in reference to the writings and doctrines of many of the antient Greek philosophers. The general distinction between the classes of works called by these respective names is this: the 'exoteric' were those writings which were in a more popular form; the 'esoteric' those which were written in a scientific and more exact form. The 'esoteric' would of course contain a true investigation of principles as then understood; the 'exoteric' would exhibit philosophical systems in such a form as the mass were able and willing to receive. The 'exoteric' writings consequently accommodated themselves to popular prejudices and superstitions, this being the only safe way in which a certain amount of philosophical truth could be conveyed to the vulgar. The 'esoteric' writings and doctrines were reserved for those who were far enough advanced to understand them, and to form a just notion as to the prevalent false opinions of the mass of the people. It is important to bear in mind this distinction between 'exoteric' and 'esoteric' doctrines in forming our judgment of the character and writings of the antient philosophers. [ARISTOTLE, p. 334.]

EXPANSION. [HEAT.]

EXPECTATION OF LIFE, a term applied to the mean or average duration of the life of individuals of any given age. [LIFE, MEAN DURATION OF.]

EXPECTORANTS (from *ex*, out of, and *pectus*, the chest) are medicinal agents, which, in certain conditions of the system, will, either by promoting or repressing the secretion of the air-passages and of the lungs, facilitate its expulsion. The articles which bear this name differ considerably as to the means by which this end is accomplished. They are chiefly derived from the vegetable kingdom, some being gum-resins, or balsams, of a stimulating quality, while others are possessed of nauseating or sedative properties; vapours also are expectorants, and may be either simple, as that of warm water, or medicated with different impregnations. Vapours alone reach the organs to be affected, and are therefore the only *direct* expectorants; the others being taken into the stomach must operate by sympathy or some other obscure agency.

From the differences in the nature of the substances regarded as expectorants it is clear that they must operate in a very different manner, according to the state of the system, the pathological condition of the lungs, and the stage of the complaint. Great care is necessary in selecting the particular agent suited to each case, and in no set of diseases are greater errors committed by unprofessional persons by an injudicious employment of these agents, than in those of the lungs, from common colds to the more serious and fatal affections of these vital organs. The slight nature of many of the common maladies of the throat and lungs, and the fatality of consumption, which is generally though most erroneously regarded as an affection of the lungs themselves, while it is truly an affection of the whole constitution, have led to a degree of interference with the treatment of diseases of these organs not attempted in any other cases, as the multitude of popular remedies for *coughs*, *colds*, and *consumptions*, attest.

Those who regard their health and wish to prolong their lives should beware of tampering with such important organs by means of any of the numerous *nostrums* vended to the public. To treat satisfactorily the diseases of the lungs it is necessary to know their structure, and the relations they have to the other parts of the body. The bronchia (or air-passages) and air-cells of the lungs are lined by a *mucous* membrane, and have of consequence relations of sympathy with the skin and intestinal canal more close than with any other part of the system. A vicarious discharge or secretion is thrown off by the internal (pneumogastric) or external surface (*i. e.* the skin), and any considerable diminution of this discharge on the part of either is in some degree compensated for by augmented secretion of the other. Hence when the insensible perspiration of the skin is suddenly checked by exposure to cold, a double duty is thrown upon the internal membrane, sometimes of the intestines, when diarrhœa may result, sometimes of the lungs, when catarrh (common cold), or pneumonia may ensue. This fact enables us both to comprehend the cause of some of the diseases in which expectorants are proper, and their mode of aiding the cure.

A certain exhalation from the internal surface of the lungs and air-passages constantly goes on in a state of health—any considerable diminution or augmentation of this secretion may require the assistance of medicines to raise it to the proper quantity in the one instance, or to evacuate the superfluity and repress the tendency to its excessive formation in the other. The chief causes which lead to diminished secretion are inflammation and spasm—hence at the commencement of inflammatory affections of the air-passages and of the lungs the inner membrane is dry, and by the stethoscope what is called the crepitating *râle* is heard; in asthma and hooping-cough, while the spasm lasts, there is an absence of secretion, which becomes abundant when the spasm yields.

To obviate these states very different means must be employed from what are necessary in the later stages of an inflammatory affection, or where there was extreme relaxation of the vessels of the lungs, and the exhaled fluid redundant in quantity. One of the terminations of inflammation being by effusion, when the increased action of the vessels has lasted for some time a state of the lungs occurs which is precisely the reverse of what it was before, and an extreme quantity of mucus obstructs the access of air to the blood circulating through the cells of the lungs: if this continue to accumulate, suffocation must follow. Too great an accumulation sometimes takes place, especially in elderly people, not from excessive secretion but from deficient absorption.

These are a few of the different states for which expectorants are used, but much circumspection is required to accommodate the means to the end. Where there is decided inflammation the best expectorants are those which lessen the inflammatory state, such as venesection and nauseating doses of tartrate of antimony or of ipecacuanha, and the inhalation of the vapour of warm water, simple or medicated, by means of Mudge's Inhaler. But as the use of any such instrument requires considerable exertion of the respiratory organs, where the inflammation is violent it is inadmissible, as the lungs must be kept in as tranquil a state as possible; but the head may be held over a basin of warm water, the vapour of which will be received by the lungs in the ordinary course of respiration.

When the inflammation has subsided, the more stimulating expectorants may be used. Where there is first spasm hindering secretion, and ultimately an excessive exhalation which must be cleared away, a combination of a sedative or antispasmodic medicine with the expectorant is best.

These are the principles which should regulate our choice in the more acute affections of the chest; but as no set of organs are so subject to chronic disorders as the lungs and their appendages, we frequently have recourse to expectorants to alleviate many of the symptoms attendant on them.

Lessening the tendency of blood towards the lungs, and directing it more towards the skin, is of service both in acute and chronic affections of the chest. Hence bathing the feet in warm water on the first feeling of an attack of cold, followed by antimonials or other diaphoretics, is of much utility, if the patient go into a warm bed immediately; while, on the same principle, the use of flannel next the skin is the best preventive, and is indispensable for all delicate persons, particularly if predisposed to diseases of the lungs.

EXPLANARIA. [MADREPHYLLICEA.]

EXPONENT; EXPONENTS, NOTATION OF. In the algebraical expression a^x, x is called the exponent of a. If we were strictly to preserve the most antient meaning of the term, x would be called the exponent of the whole symbol a^x: but it is usual to call x the exponent of a, and the logarithm of a^x.

From the time of Descartes it has been usual to employ exponents in abbreviation of repeated symbols of multiplication: but this was only the beginning of a series of extensions which have made the theory of exponents a fundamental part of analysis. Beginning with the simple substitution of a^2 instead of $a \times a$, a^3 instead of $a \times a \times a$, and so on, we have a succession of new symbols suggested by the processes of algebra, namely, that a^1 should stand for a, a^0 for unity, a^{-x} for the reciprocal of a^x, and $a^{\frac{m}{n}}$ for the nth root of the mth power of a. These conventions being made, the common algebraical theory of exponents is complete; and the student will find in works on algebra an account of the manner in which the necessity for these extensions appears. The theory of logarithms flows naturally from this notation and the binomial theorem.

Looking at the notation of exponents in another point of view, we see that a^1, or a, signifying the performance of a certain operation on the unit, a^2, or aa, signifies the repetition of the same operation upon a itself; a^3 denotes the repetition of the same operation upon a^2, and so on. Hence by analogy, whenever, in the higher parts of analysis, ϕx signifies an operation performed upon x, $\phi^2 x$ signifies the repetition of the operation upon ϕx. Thus if ϕx signify $1 + 2x$, then

$$\phi^2 x \quad \text{is} \quad 1+2\ (1+2x) \quad \text{or} \quad 3+4x.$$
$$\phi^3 x \quad \text{is} \quad 1+2\ (3+4x) \quad \text{or} \quad 7+8x, \text{ \&c.}$$

It appears by reasoning analogous to that which establishes the meaning of exponents in algebra, that $\phi^0 x$ must stand for x itself. Also $\phi^{-1} x$ must signify the operation inverse to (or which destroys the effect of) ϕx; thus if ϕx signify x^2, $\phi^{-1} x$ must be $\sqrt{x}$. Also $\phi^{\frac{m}{n}}\, x$ means that operation which performed n times in succession, gives the same result as ϕx performed m times.

The Differential Calculus and the Calculus of Differences furnish striking examples of the notation of exponents. As soon as the student arrives at the higher parts of these subjects, he should pay particular attention to the structure of the notation, and in particular to the meaning of those theorems in which the symbols of operation are separated from those of quantity.

EXPORTS. [IMPORTS AND EXPORTS.]

EXTENT (Lat. *extenta*) is a writ of execution (sometimes called an *extendi facias*), which is directed to the sheriff against the body, lands, and goods, or the lands only, of a debtor; and it is also used as signifying the act of the sheriff or officer upon the writ itself.

The king by antient prerogative is entitled to this writ, either in chief or in aid for the purpose of obtaining satisfaction of debts originally due to him or assigned to the crown. *The writ of extent in chief* is an adverse proceeding by the king for the recovery of his own debt, and in which he is the real plaintiff. This writ is issued out of the equity side of the Court of Exchequer; and the sheriff, for the purpose of executing it, may break open the defendant's doors, when purposely closed, either to arrest him or to take his goods. If however the defendant cannot be found, or is not meant to be arrested, the sheriff impanels a jury to inquire as to the debtor's lands and tenements, goods and chattels; and after the inquisition is made, the lands then become bound to the crown until the debt is satisfied. *The writ of extent in aid* is also sued out at the instance and for the benefit of the crown against the debtor of a crown debtor: in this proceeding the king is the nominal plaintiff only. This writ is in effect an extent in the second degree, and in order to obtain it an extent *pro forma* is sued out against the debtor to the crown, upon which an inquisition is taken; and if it be thereupon found that another person is indebted to him, the Court of Exchequer, on an affidavit to that effect, and also to the effect that the crown debt is in danger, will grant a fiat or warrant for an immediate extent in aid. Under this writ, the body of the defendant may in strictness be taken in execution as well as his lands, tenements, goods, and chattels, &c.; but where there are effects sufficient to satisfy the debt, the court seems generally disposed to give the defendant his discharge.

On the return of the writ of extent in chief or in aid to the court from whence they are issued, an order is endorsed on the back of it, 'that if no one shall appear and claim the property of the goods, &c. mentioned in the inquisition, on or before that day se'nnight, a writ of venditioni exponas shall issue to sell the same.' If the produce of the goods sold be not sufficient to pay the debt, the court will make an order for the sale of the debtor's lands under the 25th George III., c. 35.

There are various means of resisting the execution of the above writs, on the ground of informality or want of title in the crown; which may be referred to in the second volume of Mr. Tidd's work on the practice of the superior courts.

The writ of extent for the subject is founded upon a recognizance at common law or by statute, or upon a judgment in an action of debt against an heir, on the obligation of his ancestor. It is very similar in its effects and mode of execution to the other writs of extent already specified. [ELEGIT.]

When lands are delivered over to a creditor upon an extent, a reasonable but not the real value is set upon them; and the effect is the same as if the creditor took a lease of the lands until his debt is satisfied. The time during which the creditor will hold the lands will of course be determined by a comparison of the value set on the lands with the amount of the debt. (Coke *on Littleton*; Tidd's *Practice*; Blackstone's *Commentaries*.)

EXTORTION; any oppression under colour or pretence of right. In its more common acceptation, extortion is applied to the unlawful taking by an officer, under colour of his office, of any money or valuable thing where none at all is due, or not so much is due, or before it is due. The officer is punished by fine and imprisonment, and by removal from office. Where no fee at all is due, the offence is more properly exaction—the distinction is thus made in the *Termes de la Ley*: 'Extortion is where an officer demandeth and wresteth a greater sum or reward than his just fee; and exaction is where an officer or other man demandeth and wresteth a fee or reward where no fee or reward is due at all.'

EXTRACTION OF ROOTS. [INVOLUTION AND EVOLUTION.]

EXTRACTS are medicinal preparations of vegetable principles, obtained in various ways. Sometimes they are merely the juices expressed from the fresh plants, brought by careful evaporation to the consistence of honey, and then more properly denominated *inspissated juices;* at other times they consist of certain principles of the fresh or dried plant extracted by some menstruum in which they are soluble, such as water, proof spirit, or vinegar, and afterwards evaporated, as in the former case. According to the nature of the menstruum employed the extract is called *watery*, *alcoholic*, or *acetous*. The objects proposed in such proceedings are, to ensure the preservation of the active principles of the plant by removing the fluid in which they are dissolved, or the materials with which they are associated, that have a greater tendency to fermentation or putrefaction; to bring the valuable portion into the smallest possible compass; and to facilitate the administration of them by thus rendering them capable of being made into pills, &c.

The preparation of extracts requires the greatest care. The plants must be in every respect of the best quality, as regards the place of their growth, season when collected, &c., and the evaporation must be conducted rapidly, yet at a low temperature. Orfila found that the excellence of preparations of this kind was always in the reverse ratio of the temperature employed to form them. Mr. Barry effected a great improvement in the mode of preparing extracts by evaporating *in vacuo*. During the preparation, and especially towards the end of the operation, frequent stirring the contents of the evaporating-pan is necessary to prevent burning or decomposition of any portion of the mass. Extracts may also be formed from dried plants, barks, roots, &c., by reducing them to fine powder and macerating it for 24 or 48 hours in sixteen times its weight of water. In general cold water is now employed, but in some cases it is proper to employ warm. The extract of cinchona, prepared with cold water, is less powerful than that prepared with warm.

Extracts are simple or compound, according as they are prepared from one plant or from several different kinds.

This mode of preparing vegetable principles is generally unsuitable where a volatile oil is the active agent, unless great care and a very low temperature be used.

A well-prepared extract should possess in a great degree the odour, and especially the taste, of the plant from which it is obtained; it should not have either an empyreumatic smell or taste, and it should have a proper and uniform consistence. It is necessary to preserve extracts in a dry situation: to assist in keeping watery extracts, it is customary to sprinkle a little alcohol over the surface before covering them up; but watery extracts, if made with cold water and due care, rarely require this precaution. It is proper to examine the condition of all extracts very frequently, both during very warm and very wet weather: any portion which seems spoiled should be immediately thrown out.

Formerly, from the careless or unskilful mode of their preparation, extracts were the most uncertain and useless form of vegetable remedies; but since competent practical and scientific chemists have given their attention to the subject, they are now, in many instances, the most valuable contributions which chemistry has made to practical medicine.

EXTRAVASATION (*extra*, without, *vas*, a vessel), in medicine, signifies the escape of any of the fluids from its natural reservoir or canal into some neighbouring cavity or texture. The term is nearly synonymous with effusion, but less comprehensive, as it does not include the case of fluids poured out by secretion, such as dropsies, or any of the products of inflammation. It is most commonly employed in designating effusions of blood or of urine; and we shall therefore confine what we have to say on the subject to a brief notice of the principal varieties of these accidents, referring the reader for more complete information to other parts of the work.

Extravasations of blood are always serious and often fatal when the larger vessels and more important organs are concerned in them. Thus if blood escape in consequence of the rupture of an aneurism of the aorta into the bag which encloses the heart, the circulation is immediately arrested, and sudden death ensues. Such an accident is said to be 'an extravasation of blood into or within the pericardium.' [ANEURISM.]

Blood is sometimes driven with great force from a ruptured or wounded artery into the loose spongy substance consisting of connected cells which surrounds and separates the various organs, and is found in great abundance in every part of the body. This is called 'extravasation of blood into the cellular tissue' of the part. In such cases, if the vessel be a large one, the extravasation may be so considerable as to occasion enormous swelling and distension of the contiguous parts; and it may be fatal from the amount of the hæmorrhage, or from pressure upon some vital organ, or from mortification. [HÆMORRHAGE.] This is a frequent source of danger in gunshot wounds. Fractures also are generally followed by considerable effusions of the same kind, which however are soon absorbed, and are not often attended with serious consequences, except in fractures of the skull: in that case they compress the brain, and produce the symptoms of apoplexy. [HEAD, INJURIES OF THE.] The *thrombus*, or swelling beneath the skin, so frequently observed after bleeding from the arm, is also formed by extravasation of blood into the cellular tissue. It arises from the puncture in the skin not corresponding with the opening in the vein, or not being sufficiently large. It soon disperses, and is of little importance. [BLEEDING.] Contusions are likewise followed by extravasation of blood into the cellular tissue under the skin and in the skin itself from the rupture of small vessels; and this is the reason of the dark colour assumed by the bruised parts, which often extends to a considerable distance from them; as in the familiar instance of a black eye. This superficial extravasation is generally called *ecchymosis*, a word of the same import.

Spontaneous extravasations of blood, allied to those last mentioned, frequently take place in the progress of various diseases, of which they may be causes or symptoms. The spots which appear under the skin and beneath the membranes which line the internal cavities and tubes, in plague, typhus fever, sea-scurvy, and other complaints, are of the symptomatic kind; and these as well as the discolorations after contusions are included in the general term *ecchymosis;* they are also known by various other names, as *vibices* (wheals), *petechiæ*, and *purpura*. They are frequently attended with bleeding from the mucous membranes of the intestines and bladder, and of the nose; and they often occur, in the lower extremities especially, when the liver is enlarged, or otherwise diseased. They are supposed in general to indicate a want of tone in the system, and are attributed by some to a *dissolved* and semiputrescent condition of the blood; but they arise in some instances from a plethoric habit, and require bleeding for their cure.

One of the most common causes of apoplexy is an extravasation of blood in the substance of the brain, or between its membranes, from the simultaneous rupture of many minute arteries. It happens for the most part suddenly, when the vessels of the head are preternaturally distended, but yet not without some premonitory signs; and as the affection occurs most frequently at an advanced period of life, when the arterial system in general is disposed to disease, it is probable that the rupture is often preceded by some morbid change which renders the capillary vessels more than usually fragile. [APOPLEXY.] The term *apoplexy* has been extended by modern pathologists to similar extravasations occurring in the texture of other organs besides the brain; it may take place in the liver when the venous system of the abdomen is loaded with blood, and from other causes; and it frequently happens in the lungs when their circulation is either obstructed or too forcibly urged in various diseases of the heart. [HEART.] It likewise happens very commonly in the early stage of consumption, when the body is yet full of blood, and the substance of the lungs is rendered brittle and inelastic by the deposit of tuberculous matter. [PHTHISIS.] When it occurs in the lungs, the injury is attended with *hæmoptysis*, or spitting of blood. In this, as in many extravasations of the same kind, it is probable that the blood is effused rather in consequence of a *rent*, or breach of continuity in the structure concerned, than from what is implied in the common notion of the breaking of a blood-vessel.

The presence of extravasated blood does not in itself produce much irritation, and the coagulum is soon absorbed when the quantity is not very great, and the vital powers are not depressed by concomitant causes. Where pressure is applicable, the absorption is much quickened by a bandage put on after the immediate effects of the injury have subsided, as in sprains and bruises of the limbs: friction and embrocations have the same effect.

Extravasations of urine may take place in consequence of rupture of the bladder or urinary passages from ulceration, mechanical injuries, or any cause that produces distension to a great degree. If the fluid escape into the cavity of the abdomen, the result is uniformly and speedily fatal. If it insinuates itself into the cellular tissue in the neighbourhood of the neck of the bladder or the urethra, the accident is still a very serious one, though it generally admits of cure if the nature of it be immediately recognized. The fluid, which is highly deleterious, must be promptly evacuated by free incisions, and care must be taken to prevent further infiltration. If this be neglected, unhealthy suppuration is sure to take place, accompanied by fever of a typhoid character, and followed by extensive mortification.

The most common causes of infiltration of urine are abscesses of the prostate gland, and neglected or mismanaged strictures; and a very frequent consequence is the establishment of a urinary fistula in the perineum. [URINARY ORGANS.]

It may be remarked that the bile is sometimes extravasated in the same way from the gall-ducts or bladder. If it escape into the abdomen, it is followed by a similar fatal result from inflammation of the *peritoneum*. [ABDOMEN; CALCULI, BILIARY.]

EXUMA. [BAHAMAS.]

EYCK, JOHN VAN, the improver and supposed inventor of oil-painting, sometimes called John of Bruges from his having settled at that place, was born at Maaseyck as is generally said, in 1370, and studied with his elder brother Hubert (born in 1366), an artist of reputation, but now rarely mentioned except in conjunction with himself. There are however some reasons for supposing John to have been born much later than 1370. There are very contradictory accounts of his merits. Some extol him as a various and expressive designer; others say he had no claim to repute, except as a colourist; others again found his whole fame upon his discovery of the art of painting in

oil; and it was concluded by most, till lately, chiefly on the authority of Sir Joshua Reynolds, that Raspe the antiquary, in a treatise on the question, had deprived him even of this last remnant of his renown. Raspe certainly proved that he did not make the discovery; but he surmised, what Lanzi has since shown to be the probable conclusion, that although Van Eyck did not invent, he greatly improved the art of oil-painting, and brought it into general use. This was effected by his discovering the means of giving consistency to colours without drying them in the sun, and of adding to them clearness and brilliancy by a water-proof varnish. After having long resided in the rich and flourishing city of Bruges, the two brothers removed about 1420 to Ghent, where their greatest and most renowned work, the adoration of the Lamb, was painted between the years 1420 and 1432. Some say it was painted for Iodocus Vyts, a rich citizen of Ghent, while others affirm that it was by order of Philip, duke of Burgundy, count of Flanders, who came to the government in 1420. It is certain however that John Van Eyck was long attached to the brilliant court of Philip. This often described picture contains no fewer than 330 figures. It is with folding-doors, filling in all twelve panels. It was so highly prized that it was shown only on particular occasions. Philip II., king of Spain, thought of removing it to Madrid, but was prevailed upon to content himself with a copy by Michael Coxis of Malines. This copy has in our days found its way back to the Netherlands, and thence, as it should seem, to Berlin. The fate of the original is remarkable, and much to be regretted. It remained entire till the French, getting possession of Belgium, of course turned their eyes to so rich a prize. The clergy of the cathedral of St. Bavon succeeded however in concealing eight of the twelve panels, so that only four were taken to Paris, whence they were brought back in 1815. The clergy have since sold six of the panels which were concealed, and they are now in the Royal Museum at Berlin, where they are united with a part of the copy made by Coxis for Philip II. Hubert Van Eyck died in 1426. John is generally said to have died in 1441, but the date of his death is uncertain. (Raspe, Descamps, Lanzi, &c.)

EYE. The organs appropriated to the sense of sight are distributed very extensively, yet with that frugality which always regulates the operations of nature in the construction of animals. All the active species which live in the light are furnished with them; the rest are disqualified to possess as well as to profit by them, by their limited powers of locomotion, or by constant residence in the dark. In conformity with this rule, to which there are few, if any, exceptions, these organs are occasionally associated with the lowest types of animal development, and are sometimes absent in the highest. Thus some radiated animals, most of the articulated tribes, and many of the mollusca, have manifest organs of vision, and some of them are of the most curious and artificial construction: on the other hand, the mole and the shrew-mouse*, both vertebrated animals, and belonging to the highest order of that class, the mammalia, are blind. They have eyes, it is true; but those of the mole are not larger than the head of a pin, and are unprovided with optic nerves; and the equally imperfect eye of the shrew is covered with skin, from which hair grows as on the rest of the body. Hence, even in the absence of further evidence, we might conclude that if these animals have any perception of light, it can only be sufficient to warn them back to their haunts when by any accident they emerge to the day. But it is more probable that they do not see at all; and that these rudimentary organs, like the male nipple, exist only in conformity with the general model of vertebrated construction.

The structural peculiarities of the eye, as well as the presence of that organ, may be inferred with more certainty from the circumstances of an animal, than from the place it occupies in any zoological scale: in fact, no part has a closer relation to the habits and mode of existence. The eye may be simple or compound, single or multiplied, fixed or moveable: it may be encased in a hard transparent shell; or lie deeply imbedded within the protection of a bony socket; or project from the surface of the head at the extremity of a sensitive and retractile horn: it may be adapted for near or distant, oblique or direct vision; for seeing in a strong or a weak light, in a dense or in a rare medium; or it may be formed so as to accommodate itself to each of these conditions in its turn: and these peculiarities will all be found upon examination to be in strict accordance with the exigencies of the animal. Mere difference in bodily size, and the proportionate reduction or increase in the bulk of the eye, is sufficient to constitute a reason for a difference in its structure, and may suggest an explanation when such discrepancies are observed to exist in animals otherwise alike.

* *Aspalax cæcus.*

Yet with all the varieties in configuration to which we have alluded, it is rather in form than in substance that the eyes of animals differ from each other. The organ has always a common purpose, and is essentially the same in all cases: that is, we find an assemblage of the same fundamental parts, generally arranged in the same order, even when our powers of observation are assisted by the microscope, and until all traces of organization are lost in extreme tenuity of texture and the transparency which results from it. And although there are refinements in the structure of the organ of which we do not know the purpose, and certain delicate adjustments in the exercise of the faculty of which we do not know the instruments, yet upon the whole we can deduce the principles upon which the eye is constructed, and assign the uses of its several parts with great certainty from our knowledge of optical and physiological laws.

Having offered these prefatory remarks on the organ in general, we now proceed to the most interesting of its varieties—the human eye. We propose, in the first place, to describe its anatomical structure at some length, noticing as we proceed, or subsequently, some of the most remarkable peculiarities in the eyes of other animals. We shall then add a few observations on the physiology of vision, and complete our account of the organ with an outline of its most important diseases in the human subject.

The object, or what may be called the *general problem*, of the beautiful mechanism we have to consider, is to combine distinctness and extent of vision with the security and maintenance of the organ, and the utmost convenience in using it. The parts associated for these purposes are the *orbits*, or sockets, of the eye; the *optic nerve*; the *eyeball*, or globe, with its contents, and the external muscles which move and suspend it; the *eyelids*; the *lacrymal apparatus*; the nerves and vessels which supply these parts, and the mass of fatty and cellular substance which isolates and supports them. We shall describe these parts nearly in the order in which they have been enumerated.

Orbits.—The eyes with their appendages are lodged in two symmetrical roomy cavities in the skull, completed in front by the eyelids, but elsewhere entirely circumscribed by bone, the office of which, it need hardly be said, is to protect them from injury, and from any pressure that might embarrass the perfect freedom and precision of their movements. These cavities are called the orbits, orbital fossæ, or sockets of the eye. Seven bones of the cranium or face, which we need not enumerate, enter into the composition of each. They are separated from each other in their whole depth, which is about two inches, by the posterior chambers of the nose. They are conical in shape, or, more strictly speaking, pyramidal, and obscurely quadrangular. The apex is directed backwards; the base, about an inch and a quarter in width, is directed forwards, with a considerable inclination outwards or towards the temple. The margin is less prominent at the outer side than elsewhere, so that when viewed laterally it presents a wide semicircular notch, with the concavity forwards. One object of the divergence of the orbits, and of this retreating curvature of the outer margin, is obviously to increase the extent of vision. If the point of the finger be held before the eye, and carried gradually back towards the ear, it will be observed that, in consequence of this arrangement, it can be seen long after it has got behind a vertical plane touching the front of both eyes, which, taken together, are thus enabled to sweep over an angle of about 220°, or 20° on each side behind the tangent plane. Above and below, the edge is undercut as well as prominent, and the socket is therefore a little wider within than at the margin itself, so that it slightly overhangs the eyeball at these points. The inner or nasal sides pass directly backwards and are parallel to each other, and the roof is horizontal; consequently the conical form of the cavity arises from the inclination of the outer side and floor. In the angle between these sides, and in that between the first and the roof, there are two long irregular slits. The former opens into the deep hollow between the

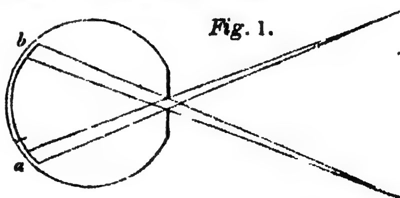
temple and the back of the upper jaw; it is called the *foramen lacerum inferius*, or *spheno-maxillary fissure*, and gives passage to a branch from the fifth pair of nerves, which piercing the bone, passes beneath the floor of the orbit, and emerges upon the cheek through a hole just beneath the lower edge of the orbit, about a third part from the inner angle of the eye. The other slit, which is called the *sphenoidal fissure*, or *foramen lacerum superius*, opens into the cavity of the head, and transmits another branch of the fifth pair, which passing within the orbit, along the roof, comes out through an opposite notch in its upper margin, and is distributed upon the forehead and upper lid. These branches of the fifth pair, called the *supra* and *infra-orbitary* nerves, are the most frequent seats of that excruciating affliction the *tic-douloureux*. Through the sphenoidal fissure are likewise transmitted the ophthalmic veins, and all the other nerves except the optic destined to the eye and its appendages. A third opening, which is circular, called the *foramen opticum*, of the size of a large quill, and leading also from the cavity of the skull, gives passage through the sphenoid bone to the ophthalmic artery and the optic nerve. It is directed obliquely outwards and forwards, and is situated at the apex or back part of the orbit, in the angle between the nasal side and the roof. In the same angle, close to the margin, that is just within the corner of the eye near the nose, there is a deep groove leading into the lacrymal canal, to which we shall have occasion to recur hereafter.

Optic nerves.—The optic nerves, arising at the back part of the brain, with which they have extensive and important connections, not only where they seem to originate, in the *corpora quadrigemina*, but throughout the whole of the first part of their course within the cranium, pass horizontally forward above the floor of that cavity, converging towards each other till they meet, when they become closely united. It is probable that they not merely meet, but cross each other, the greater part, if not the whole, of the nerve from the *right* side of the brain going to the *left* eye, and *vice versâ*. It has been ingeniously supposed by Dr. Wollaston (*Phil. Trans.* 1824), in order to account for some singular phenomena of disordered and healthy vision, that this *decussation* or crossing takes place only with respect to those parts of each nerve which lie towards the other; so that each supplies the outer half of one eye and the inner half of the other. This he conceives would explain, among other things, the correspondence between the *homologous points* of the two eyes, which may be defined as those points which see the same object at the same time. It is scarcely possible to verify such speculations by dissection, from the softness and apparent homogeneity of the parts. In fish* the optic nerves cross each other entirely without touching; and in man, when the sight of one eye has been lost, the nerve beyond the point of union within the cranium has been observed to be wasted or diseased on the side opposite to that of the affected eye. [BRAIN; NERVE.] Beyond the point of junction the nerves again diverge from each other, and passing into the *optic foramen*, become invested in a tough, flexible, and fibrous sheath, which is a tubular production of the strong membrane called the *dura mater* which lines the cavity of the skull. The outer part of this sheath is reflected off as the nerve enters the orbit, and expanding, adheres to the bony surface of that cavity throughout, becoming its *periosteum*. The nerves, continuing to diverge, reach the eye-ball after a somewhat tortuous course of an inch in length. The curvature and laxity of the optic never give facility to the movements of the globe, and preserve the delicate structures within it as well as the nerve itself from the injurious effects of tension. Its length is such as to allow the eye-ball to project slightly beyond the edge of the socket in front and to afford space behind for the action of the muscles which move it, and a suitable distance between their points of attachment. Including the thickness of the sheath, it is about one-sixth of an inch in diameter. It does not consist, like other nerves, of a bundle of distinct fibres, but of a medullary pulp inclosed in minute transparent tubes. The sheath is pierced half an inch from the globe by a vessel called the *arteria centralis retinæ*, which, accompanied by several small veins, reaches the axis of the nerve, and passes with it into the interior of the eye. The nerve does not enter the back of the globe exactly in the axis of vision, but about the fifth part of an inch from it, in a horizontal line, on the inner or nasal side, and subtending an angle of about 23° at the centre of the eye. At this point the dimensions of the sheath are suddenly contracted, and it terminates in a thin cul-de-sac, pierced with minute holes or pores, hence called the *lamina cribrosa* (sieve-like plate). Through these pores the pulp of the nerve, divested of its tubular involucra, passes into the interior of the globe in divided portions; but immediately reuniting, expands at the back of the eye into a delicate cup-shaped membrane, with the concavity directed forwards. This expansion of the optic nerve is called the *retina*; it is the most important part of the eye, having a peculiar and exclusive sensibility to the impressions of light, of which immediate notice is conveyed from it along the collected nerve to the brain. All other parts of the mechanism of vision are subordinate to this; and their whole office, independently of the conservation of the organ as a part of a living body, is to regulate the quantity of light admitted into the eye, and to distribute it in such a way upon the surface of the retina, that the impression, which, if immediately received, would be confused and general, may be an exact counterpart of the visible surface of the object.

Mechanism of distinct Vision.—A specific account of the several provisions which conduce to this end will be more readily apprehended if the circumstances which make each of them necessary be first briefly passed under review, and the requisite parts be supposed to be added to the retina in succession.

The most elementary fact that we know respecting light is, that it proceeds in straight lines or rays from every point of a luminous or illuminated body. A sensitive surface or retina presented nakedly to such a body would therefore intercept innumerable cones or pencils of light, each diverging from a different point of the object. But each point of the retina must also be considered in that case as the apex of a cone of rays *converging* upon it from *every* part of the object; and it is manifest that the various impressions thus received upon the same point at the same time would be undistinguishable from each other. All therefore that we can conceive to be communicated to the mind by the sum of such indefinite impressions over the whole retina, is a knowledge of the prevailing colour of the object, and possibly a general idea of its direction. But if there were more objects than one, or that one had 'parts or magnitude,' even this inconsiderable addition to the mere sense of light and colour would be impossible. The confusion resulting from the simultaneous impressions of a multitude of pencils of light on the same surface would be partly removed if the seat of perception were placed at the bottom of a cavity capable of being turned to each object or each part of the same object in succession, inasmuch as this would prevent the interference of rays proceeding from parts not actually under contemplation; but an indistinctness would still remain in proportion to the magnitude of the field of view, only remediable by narrowing the cavity to a mere capillary tube, upon the inconvenience of which we need not enlarge.

Let us consider what would be the effect of a very simple addition to the cavity. We will suppose it to be closed in front by a dark screen, perforated with a small central hole as in the section represented in *fig.* 1.



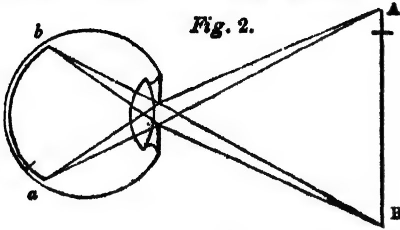


Fig. 1.

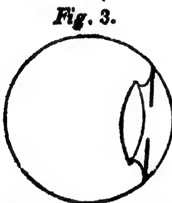
In this case pencils of rays crossing each other from A and B, the top and bottom of an object, would impinge at *a* and *b* upon different parts of the retina. By this means the advantages of a large and a small field of view would be combined, a *distributed* impression of the object would be produced, and its several parts would be seen separately and in their proper relative situations. The effect may be easily shown by holding a card, pierced with a smooth circular hole, near a taper, and throwing the spectrum upon a wall at a little distance. Such a screen is termed the *iris*.

* Except in the haddock (*gadus morrhua*), D. W. Soemmering, 'Sect. Horizont. Ocul.' In this fish they do not cross each other, but pass to the orbit on the same side.

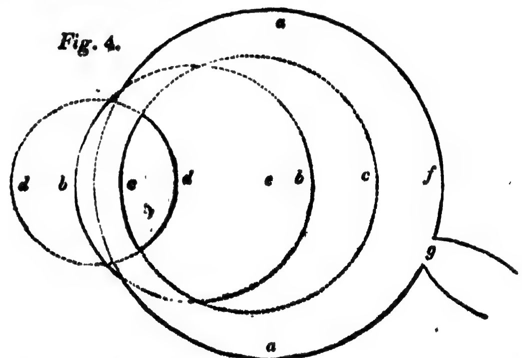


But still the rays from each point of the object would be diffused over a *space*, instead of being collected upon a separate *point* of the surface, and the impressions of contiguous pencils would in some degree overlap and confuse each other. This inconvenience might be lessened by contracting the opening, but another cause of indistinctness would then be introduced in the diminished admission of light.

Both evils might be avoided if a *lens* of a proper construction were fixed behind the screen (as in *fig.* 2). Pencils diverging from single points of the object would thus be admitted through the opening, which we will call the *pupil*, and would be made to *converge* to single points on the surface, and the impression would now be an exact counterpart of the object, A being distinctly seen in its true place and direction from *a*, and B from *b*.

But additional provisions would be necessary to bring this arrangement to the requisite degree of perfection. In the first place the retina must be adjusted to correspond in shape with the focal distance of the lens. This purpose might be accomplished, if the walls of the cavity were composed of flexible materials, by interposing a transparent fluid between the lens and the retina, which, by its uniform distension, would constrain the latter to take and retain the form of a portion of a sphere.

Again, although the diagram has been otherwise drawn for an obvious reason, our arrangement hitherto supposes the object to be very small, and to be seen directly in front of the eye; but if oblique as well as direct pencils are to be brought to a focus, that the lateral vision may be also *distinct*, a second refracting body, of a proper form, must be placed in front of the lens. This may be done very conveniently, with the further advantage of completing the cavity, by adding a transparent portion to its walls in front of the screen, to be likewise distended with fluid in order to keep it in the shape of a segment of a sphere (*fig.* 3.)



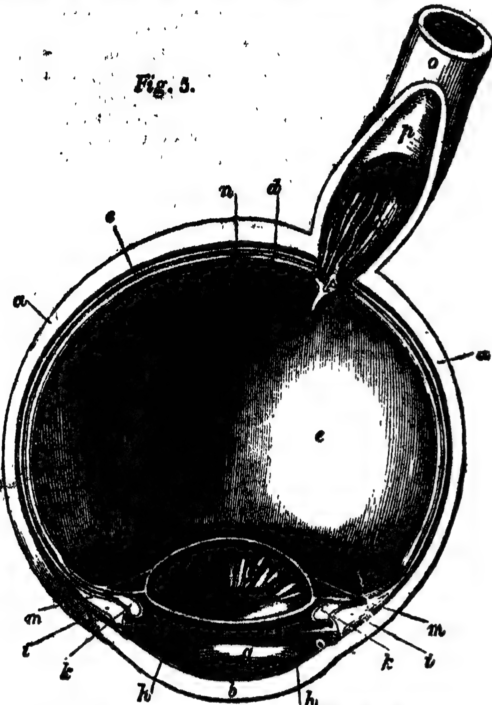
It is also desirable that the back of the screen and the interior of the cavity should be blackened, that the rays may be extinguished after impact upon the retina, lest any internal reflection should interfere with the impressions on other parts. The expediency of this provision is always kept in view in the construction of optical instruments, and may be made evident by looking at a bright object through a polished metal tube. The colouring matter is called the *pigmentum nigrum*, or, simply, the *pigment*.

The only remaining artifice to secure the perfection of the organ that need be mentioned in this synopsis of its most essential provisions, is to endow the pupil with the faculty of contraction and enlargement according to the quantity of light. If it were of a constant size, more light would be concentrated upon the retina from a bright or a near object than from one comparatively distant or faintly illuminated; and as the sensibility of the retina must remain the same, the disproportion would occasion dimness of sight in one case and dazzling in the other, and might even impair the nerve.

We have thus imagined all the parts to be built up in succession that are of primary importance (as far as we know) in the construction of an organ of *distinct vision*, and the figure to which we have arrived might pass as a tolerably correct diagram of the human eye.

The laws of light and sensation require that there should be a general type in the structure of these parts, and a mutual relation among them as to density, form, and position. But this does not preclude much variety; a difference of position, for instance, may be, and frequently is, compensated by a corresponding difference in form or density either of the same or other parts. Hence the problem of distinct vision has many solutions, each perfect in its kind. In fact nothing can be more diversified in unimportant particulars, or more uniform in those which are essential, than the interior constitution of the eye in different animals: it is never precisely the same in any two species, however closely they may be allied; but we constantly find the retina, the lens, and the pigment, and generally the iris, enclosed of course in some kind of capsule, transparent in front, and partly occupied by complementary fluids. To this there are some exceptions, which however we believe to be only apparent. Thus the larvæ of many insects, the *cercariæ*, and other microscopic animalcules, and some of the molluscs, have red or black spots upon their surface, which are undoubtedly eyes, and are thought by some to be little more than expansions of an optic nerve beneath a thin coloured membrane to absorb the light, and in some unknown way to distribute its impressions. But when observation fails us, our presumptions with respect to natural phenomena should be guided by analogy and accord with known principles; and as nothing that we know of light enables us to conceive how so inartificial a construction as this can account for the acute vision obviously enjoyed by some of these animals, we are disposed to adopt another view of such coloured points, and to consider them as a congeries of extremely minute but perfectly formed eyes of the usual construction, of which the pigment alone is visible from its opacity and abundance. The myriads of simple eyes observed under the microscope to be grouped together in the compound organs of the perfect insect and other articulated animals, as the scorpion and crab, afford strong analogical grounds for this opinion.

We now resume our account of the anatomical structure of the human eye.



Section of the spherical surfaces of the eye, twice the natural size; the circles completed in dotted lines.
a, Sclerotic. *b*, Cornea. *c*, Anterior surface of lens. *d*, Posterior surface of lens. *e*, Centre of the eye. *f*, Intersection of the axis of direct vision with the back of the eye. *g*, Entrance of the optic nerve.

Globe.—The globe, or eyeball, contains the parts immediately concerned in vision. It consists of very unequal portions of two spheres of a different size, which have a common circular intersection in a transverse vertical plane, much nearer the front than the back of the eye. The iris, or coloured screen, perforated centrally by the pupil, nearly occupies the situation of this imaginary plane, but is, strictly speaking, behind it. The posterior and larger portion is circumscribed by the sclerotic membrane, except in front, where it may be considered as bounded by the iris: it is rather less than an inch in diameter, and constitutes about five-sixths of the surface of the globe. (*Fig.* 4, *a*.) The included space is occupied by the choroid membrane and retina, the vitreous and crystalline humours, the ciliary body and processes, and a small part of the aqueous humour. The anterior portion, which forms about a quarter of a sphere, thirteen-twentieths of an inch in diameter (*Fig.* 4, *b*), and occupies the remaining sixth part of the surface of the globe, contains the rest of the aqueous humour, and is bounded in front by the transparent and slightly prominent disc set in the sclerotic like a watch-glass in its metallic rim, and known as the *cornea* from its horny texture. Its transverse chord, or the diameter of the circle of union be-

tween the cornea and sclerotic is nine-twentieths, or nearly half an inch in length.

The globe derives its firmness to the touch from the distension of the contained fluids: its capability to bear that distension, which insures the permanence of its shape, is due to the flexible but strong and inelastic outer covering or tunic, consisting as we have said of the sclerotic and cornea.

Section of the globe of the right eye through the optic nerve.

a, sclerotic; *b*, cornea; *c*, choroid; *d*, retina; *e*, vitreous humour; *f*, crystalline humour or *lens*; *g*, aqueous humour; *h*, iris; *i*, ciliary ligament; *k*, ciliary processes; *l*, ora serrata of the ciliary body; *m*, canal of Petit; *n*, foramen of Soemmering; *o*, sheath of the optic nerve; *p*, substance of the nerve; *q*, arteria centralis retinæ.

Sclerotic. (*Fig.* 5, *a.*) The sclerotic membrane is so called from its toughness (σκληρός, hard, rigid). It may be considered as an expanded prolongation of the sheath of the optic nerve, which it resembles in its interwoven fibrous texture. Its inner surface is continuous with the lamina cribrosa already mentioned. Immediately around this part it is about an eighth of an inch thick, and gradually becomes thinner as it approaches the cornea, which it slightly overlaps. The two structures are not separated by an abrupt line, but are blended together, and adhere so closely that they cannot be torn asunder without great force. The thin glistening tendons of the muscles which move the globe, or rather their smooth outer laminæ, are spread over and incorporated with the sclerotic in front, approaching each other till they unite near its junction with the cornea. They render it somewhat thicker in this situation than in the spaces between them or behind the line where they begin to be inserted. This front part of the capsule of the eye is called the *tunica albuginea*, from the whiteness characteristic of all tendinous parts.

Conjunctiva. The albuginea is defended from contact with the air by a transparent mucous membrane, continuous with that which lines the interior of the eye-lids. It is called the *conjunctiva reflexa* or *adnata*, to distinguish it from the *conjunctiva propria* of the lids. It is very loosely connected to the sclerotic at first to facilitate the movement of the globe; as it advances forward it becomes more closely attached to the albuginea; and hence extending to the cornea, adheres intimately to its margin and over its whole surface. The conjunctiva is the most sensitive external part of the body to all painful impressions, except cold, especially where it invests the cornea. The smallest particle of foreign matter in contact with it gives intolerable pain, and makes the act of winking to clear it away imperative on the will; and hence its chief and most essential use as part of the delicate organ of which it may be considered as the guardian. If the nerve which supplies it with sensibility be divided or injured, incidental causes of irritation are suffered to produce their injurious effects unheeded, and the eye soon becomes inflamed, ulcerates, and is destroyed.

Cornea. (*Fig.* 5, *b.*) The cornea is somewhat thicker than the sclerotic except at the back of the eye, is equally tough though rather more flexible, and of a much closer and more even texture. Its inner surface is concave, and nearly parallel to its outer surface; it is however rather thicker in the middle than elsewhere, and the general statement that it has no share in effecting the convergence of incident rays on account of the parallelism of its surfaces is therefore not quite correct. It is covered externally, as we have already mentioned, by the conjunctiva, and is lined internally by a delicate elastic membrane. The bulk of the tunic, or cornea proper, consists of several layers which slide upon each other when the membrane is rubbed between the finger and thumb, and are separated in the natural state by a limpid fluid contained in a delicate cellular structure. This fluid gives plumpness to the outer surface, which is represented by some authorities to be not *exactly* spherical, but of that kind which would be formed by the revolution of an ellipse of small excentricity about its long axis.

The sclerotic partly removed, and the rest turned back, showing the Choroid Coat and Iris.

Chorioid or Choroid membrane. (*Fig* 5, *c*, *Fig.* 6.) We have now to consider the internal tunics of the eye, the first of which is the choroid, or, more properly, *chorioid* membrane, so called from some resemblance in the flocculence of its outer surface to the *chorion*, or external investment of the ovum. This is a thin soft dark-brown structure in contact with or lining nearly the whole concave surface of the sclerotic. It may be said to originate around the entrance of the optic nerve, which passes through it before it expands into the retina; and it terminates in the posterior margin of the ciliary ligament or circle (*fig.* 5, *i*),—a flattened band of grey matter, about the seventh part of an inch in breadth, attached to the sclerotic internally near its junction with the cornea. In these situations the two membranes adhere with some firmness; they are elsewhere connected by vessels which pierce the outer and ramify upon the inner membrane, and by the filaments of a fine intermediate cellular tissue. But the connexion is so slight that it may be readily broken by gentle inflation with a blow-pipe insinuated through a puncture in the sclerotic, without injury to the fragile texture of the choroid. The choroid consists almost entirely of a multitude of minute vessels, curiously interlaced, and communicating freely with each other. It is supplied with blood by 15 or 20 branches of the ophthalmic artery, which pierce the sclerotic round the entrance of the nerve, and are at first distributed externally on the posterior part of the sphere; but they finally pass inwards, and terminate in a close and uniform vascular expansion over the whole concave surface. This is called the tunic of Ruysch, who erroneously considered it as a distinct membrane. The innumerable veins of the choroid, or *venæ vorticosæ*, are arranged with great elegance and regularity in arched and drooping branches, like the boughs of the weeping willow; they are very conspicuous upon the outer surface, above the first exterior ramifications of the arteries. (*Fig.* 6.) They unite in four or five common trunks, which emerge through the sclerotic at equal intervals behind the middle of the eye-ball. The outer surface of the choroid is somewhat rough and flocculent; the inner surface, upon which the retina is expanded, is delicately smooth and even. Both are abundantly coated with the pigment, which is secreted by every part of the choroid, and pervades its loose and porous texture.

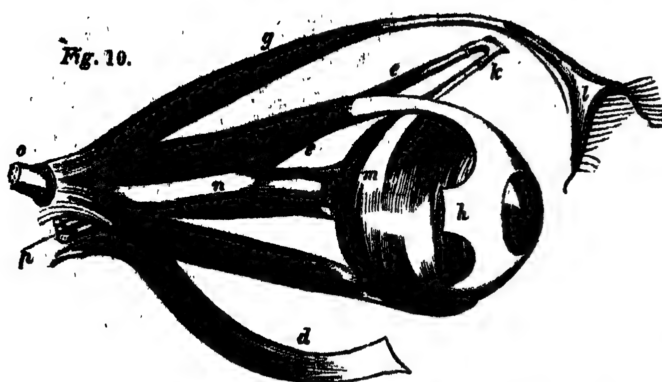
Pigment.—In man this matter is of a deep brown; in most other animals it is black, and hence is very commonly called the *pigmentum nigrum*. It appears

no part of the texture it pervades, and when the outer membranes are removed by maceration in water, it may be washed away. Both have a relation in quantity as well as in depth of tint to the complexion and colour of the hair. In the negro the iris is of so dark a hue that it can scarcely be distinguished from the pupil; while in the white rabbit and other albinoes, including the human variety, where the pigment is entirely wanting from some original malformation, the substance of the iris is transparent, and reflects only the pink colour of the circulating blood. Such eyes are dazzled by a strong light, and probably see better than others in the dusk. The iris, if minutely injected, appears, like the choroid, to be composed almost entirely of vessels. It is principally supplied by the two long ciliary arteries (*Fig.* 6)* which pierce the sclerotic about half an inch from the optic nerve on either side; and passing between that membrane and the choroid, divide near the edge and in the substance of the ciliary ligament, and are wholly distributed to the iris. Their branches are disposed in two conspicuous circles on the front surface, one near the outer or ciliary margin, the other not far from the pupil. But though the iris resembles the choroid in vascularity, it differs essentially from it in other respects. It is richly supplied with nerves, which proceed to the iris and are distributed upon it much in the same way as the arteries, and are the medium of its sympathy with the retina, and the source of its irritability. It also possesses a peculiar contractile power, thought by some to reside in fibres which they represent to be muscular, and to be disposed circularly in front and at the fore edge, and in a radiated form behind. (*Fig.* 9, *b.*) The former of these layers is supposed to contract and the latter to dilate the pupil. But this fibrous appearance may be deceptive, and is attributed by others to circular arrangements of the vessels and nerves, and to streaks and minute folds in the membrane itself.

Pupil. (*Fig.* 9, *a.*) The pupil in the human eye is bounded by a sharp well-defined circular edge. In other animals its shape is subject to many varieties which may often be explained by a reference to their habits and circumstances. In fish it is generally crescentic or imperfectly quadrangular. In herbivorous animals, which often continue to browse during the night, it is oblong and obliquely transverse, as in the horse and sheep. In most serpents and many rapacious quadrupeds, both aquatic and terrestrial, the pupil, though round and large at night, is a mere vertical slit when seen by day, especially in the smaller species of each genus, as in the common cat. It is curious that in the larger cats, as the lion and tiger, as well as in some of the larger four-footed reptiles, the pupil again becomes circular. In all birds, we believe, the pupil is round; and it may be observed that, with few exceptions, they all sleep after night-fall. In the few nocturnal species, as the owls, the pupil is very large though still round, and these birds always shun the day. The long narrow pupil i in fact a provision for a greater variation in size than the circular form permits, and is generally found in those animals which roam at night and also see well by day. When absent in such animals the bulk of the organ is commonly sufficient to secure the admission of a sufficient quantity of light after sunset without this provision. In the fœtus the pupil is closed by a vascular film called the *membrana pupillaris*, one function of which is precisely that of the centering of a bridge, to support and extend it during the process of its construction. A tubular film of the same kind has been lately discovered by Müller stretched between the margin of the pupil and the ciliary body. Both these films are absorbed before birth.

Ciliary body and processes. (*Fig.* 5, *l*; 9, *d c*). Upon the compressed anterior surface of the vitreous humour where it curves inwards from the sclerotic towards the lens rests the ciliary body, a thin, dark, annular band, about the fifth part of an inch in breadth, consisting of a frill of flat converging plaits, which encircle but do not reach the circumference of the lens. The posterior aspect is concave, and adheres loosely over the rounded vitreous humour; the front is convex, and is firmly attached to the whole breadth of the ciliary ligament, and to a small portion of the back of the iris near its junction with the ligament. It appears to be a continuation of the inner layer of the choroid, or tunic of Ruysch, but is rather thicker, and resembles it in extreme vascularity. The medullary matter of the retina terminates, as we have seen, at the indented posterior margin (*ora serrata*) of this membranous band. The ciliary body is everywhere thickly coated and pervaded with pigment, except at the extremities of about seventy minute unattached points which fringe the inner margin, and radiate towards the lens like the florets of a marigold round its central disc. These are the *ciliary processes.* (*Fig.* 5, *k*; 9, *c.*) They are separated from the uvea by the fluid of the posterior chamber, and are received behind into corresponding depressions in the vitreous humour.

Zone of Zinn.—If the ciliary body be carefully peeled off, and the thick radiated masses of pigment it leaves behind be washed away, a thin, transparent, and puckered membranous surface is exposed, extending from the indented margin of the retina nearly to the capsule of the lens, which appears to be something more than the mere external surface of the hyaloid membrane. This is called the *zone of Zinn*, from the anatomist who first drew attention to it. Various opinions are entertained of the nature of this zone. By some it is supposed to be a continuation of the vascular web, which may be called the internal tunic of the retina, arching round from the ora serrata, just as the tunic of Ruysch is continued into the ciliary body which lies upon the zone and corresponds with it in extent. The question is more curious than important in the present state of our knowledge of the functions of both of these delicate and elaborately constructed parts of the eye. The same remark may be extended to the controversies that subsist with respect to the part we have next to describe.

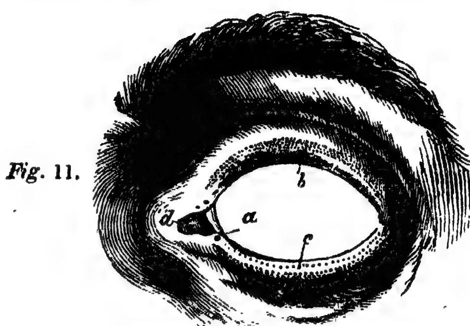


Canal of Petit (*Fig.* 7, *b*; 5, *m*). If the transparent membrane between the zone of Zinn and the margin of the lens be slightly punctured, and the point of a small blow-pipe be gently introduced, a canal may be inflated extending all round the lens in close proximity with the capsule, resembling a string of small glass beads laid in a circle. This is the *canal of Petit*. Whether the hyaloid membrane here separates into two layers, or whether the membrane of the aqueous humour lies upon it in this situation for a certain space without adhering, or how otherwise this canal is formed, it is not easy to say. In the natural state of parts it is empty and flaccid. When it is inflated the fine white triangular tips of the ciliary processes are seen to be received between its minute protuberances. But the points are loose and floating, and are not attached, as was formerly supposed, to the capsule of the lens.

Dr. Brewster has stated an opinion that the ciliary body is a muscular organ calculated to effect certain changes of curvature in the surfaces of the lens, or in its position, which seem to be required by the laws of refraction to account for the adjustment of the eye to different distances. Dr. Thomas Young was no less confident that the true solution of this optical enigma was to be found in the imagined muscularity of the fibrous structure of the lens itself. Both are high authorities, but neither opinion appears to have gained any ground.

Appendages of the Globe.—The eye-ball, of which we have thus described the contents, is lodged in the cavity of the orbit, a little nearer the inner than the outer side. In front, where the protection of bone is wanting, the two moveable and muscular eye-lids supply a sufficient defence, and contribute, by their gentle and constant pressure, to keep the eye in that state of equilibrium between opposite forces upon which the steadiness and precision of its rapid motions in a great measure depend. The space in the socket not occupied by the globe and its appendages is completely filled by a cushion of soft fat contained in elastic membranous cells, which permits the free movement of the several parts, while it keeps them separate, and affords them all, as well as the globe itself, a suitable and uniform support. Varieties in the quantity of this substance, in the capacity of the orbit, and in the development of the lids, determine the different degrees of prominence and of apparent size observed in the eyes of different persons; for the globe itself is nearly of the same size in all.

Muscles of the Eye-ball.—The movements of the globe are effected by six muscles arising from the bony surface of the orbit, and inserted into different parts of the sclerotic. Four are called *recti*, that is straight or direct muscles; the fifth and sixth are the *obliqui superior* and *inferior*, so called from the obliquity of their insertion, and their respective positions above and below the globe. The fifth, or superior oblique, is also called the *trochlearis*, from the *trochlea* or pulley through which the tendon passes.



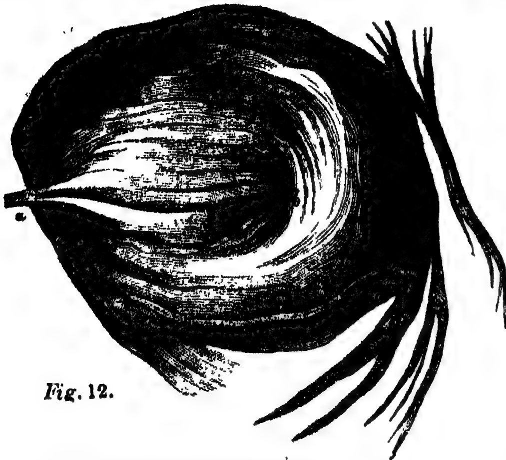
* One of the long ciliary arteries is represented in the figure by the middle white line; the narrower lines are the ciliary or iridian nerves.

a, Rectus superior; *b*, Rectus inferior; *c*, Rectus internus; *d*, Rectus externus, arising by a double head. It is represented as cut off from *h*, its insertion into the eye-ball, and turned aside to show the parts behind it; *e*, Obliquus superior, a round and tapering muscle terminating in a round tendon, which passes through a pulley or loop (*k*), and is reflected under the flat tendon of the rectus superior, and, becoming flat, is inserted at (*m*) into the sclerotic; *f*, Obliquus inferior coming round over the tendon of the rectus inferior from the front and inner edge of the orbit, near the inner corner of the eye, and inserted into the sclerotic opposite the insertion of the superior oblique; *g*, Levator palpebræ superioris, ending in a flat tendon, which is inserted into (*l*) the crescentic tarsal cartilage of the upper lid; *o*, *n*, the optic nerve; *p*, the nerves of the 3rd, 5th, and 6th pair, which pass between the two heads of the rectus externus. The rest of their course is not shown.

Lateral view of the right eye-ball, seen from the outer side, with its muscles. (This cut is to be considered only as a diagram, the proportions of the parts having been much altered to make them more distinct.)

The recti (*Fig.* 10, *a*, *b*, *c*, *d*) are four flat ribbon-like muscles, each about half an inch broad, which arise together round the edge of the foramen opticum, and embrace the nerve at its exit from the skull. They end in broad, thin, glistening tendons, attached to the sclerotic at four equidistant points, about a quarter of an inch from the edge of the cornea, above, below, and on either side. Hence they are designated as the superior, inferior, internal, and external straight muscles. We have already explained how the outer surfaces of their tendons are blended, and form the tunica albuginea. Each turns the pupil towards the side of its insertion; and it is easy to see how by their single actions, or by a proper combination of two that are contiguous, the pupil may be turned in any required direction. The rectus externus, from its position on the diverging side of the orbit, is necessarily the longest of these muscles. It has also a double origin, arising not only in common with the rest from the edge of the optic foramen, but also from the edge of the sphenoid fissure, and arches over several nerves which enter the orbit by that passage (*p*). The superior oblique or trochlearis (*e*) is a round tapering muscle, which arises near and on the nasal side of the rectus internus (*c*), and ends in a smooth round tendon. The pulley (*k*) through which this tendon passes is a small loop of cartilage fixed to the roof of the orbit towards the nasal side, just within the margin. In this situation the tendon is enveloped in a lubricated extensible sheath called *bursa mucosa;* thence spreading into a thin fan-like expansion, it is reflected obliquely backwards and outwards between the globe and the tendon of the rectus superior (*a*), and is inserted into the back part of the sclerotic at a point (*m*), intermediate between the optic nerve and the insertion (*h*) of the rectus externus, and nearer the former. Its separate action turns the pupil downwards and outwards. The inferior oblique (*f*) arises broad within the lower edge of the orbit towards the nasal or inner side, and passing obliquely backwards over the tendon of the rectus inferior (*b*), is attached to the sclerotic at the outer and back part opposite the insertion of the trochlearis. It directs the pupil upwards and outwards, supposing the eye to look originally straight forwards: if the pupil be inclined either way, to the nose or to the temple, the inferior oblique increases that inclination, being equipoised as to lateral action when the eye is slightly turned inwards, as in reading. But its tendency is always to turn the pupil upwards. To a certain extent the same remark is applicable (*mutatis mutandis*) to the action of the antagonist muscle, the superior oblique, which if exerted at the same time would counteract the tendency upwards, so that both taken together would keep the eye in that easy position so often assumed by man and animals in looking without much effort yet steadily at near objects, as in taking food, reading, and most other quiet occupations. The position we mean is that in which the axes of vision are directed slightly towards each other and a little downwards, and the eye-balls are gently pressed against the lids and by them, and thus are kept in a convenient and steady equilibrium. When the oblique muscles act together with force, they hold the eye-ball firmly against the lids and to the nasal side of the orbit. One or both of these muscles, as well as the rectus externus, are supposed to be endowed with certain automatic or involuntary actions, very useful in the economy of vision. Their functions in this and other respects have given occasion to much curious disquisition.

View of the left eyebrow and lids, showing their tarsal margins.



a, Lower *punctum lachrymale*; *b*, tarsal edge of the upper lid; *c*, orifices of the ducts of the Meibomian glands (those on the upper lid are similar); *d*, *caruncle*, situated at the inner *canthus*, or corner of the eye.

The double line of points external to the Meibomian orifices marks the situation of the eye-lashes, which are removed.

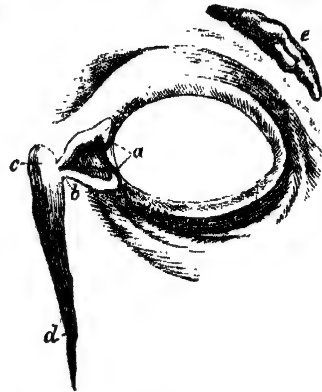
The Eyelids or Palpebræ. (*Figs.* 11, 12, 13.) The textures which enter into the composition of the eyelids are included between a soft external skin and a moist smooth internal surface, called the *conjunctiva palpebralis* or *propria.* (*Fig.* 13, *a a.*) The latter is a membrane of the mucous kind, which, as we have already mentioned, after lining the interior of the lids, passes across in a loose circular scroll or fold to the sclerotic, and is reflected back again over the front of the eye, where it is called the *adnata* or *conjunctiva reflexa.* The name is derived from the junction thus effected between the ocular and palpebral surfaces. The outer skin of the eyelids, which is extremely soft and delicate, yet capable to a considerable extent of adapting itself to different degrees of extension, is loosely connected to the subjacent parts, except at the margin (where it adheres more closely), by a moist and abundant cellular tissue, entirely devoid of fat. By means of this connection, when the upper lid is raised and these under-lying parts are retracted under the edge of the orbit, the superfluous skin is gently drawn after them, and is disposed of conveniently under the brow (*supercilium*). The eye-lids meet, when closed, by two narrow flat surfaces, accurately applied to each other, called their *ciliary* or *tarsal* margins. These epithets are respectively derived from the *tarsi* or thin concave and crescentic shells of smooth and elastic cartilage which give form to the lids, and firmness and outline to their opposed edges (*Fig.* 10, *l*); and from the lashes or *cilia*, which grow in several rows at the margins of both lids, from their extreme outward verge, and in the direction of the flat surfaces. The angles in which the margins of the eye-lids meet towards the nose and temple are called the *canthi.* The outer canthus is kept in its place during the motions of the part by a tendinous expansion or *aponeurosis*, which, adhering to the thin crescentic edges of both tarsi on their outer or convex surface, attaches them, and most closely on this (the temporal) side, to the margin of the orbit. It is called the broad ligament of the tarsi. The nasal extremities of the tarsi are confined to the side of the nose by two slips which are given off behind from the tendon of the orbicular muscle.

Muscles of the Eyelids.—Immediately beneath the subcutaneous cellular tissue there is a broad layer of muscular fibres arranged elliptically round the transverse

fissure of the eyelids, the disposition of which is well shown in the annexed figure. (*Fig.* 12.) The office of

View of the orbicular muscle of the left eyelid, as it appears when denuded of the integuments.

a, The tendon at the inner angle, or *canthus* of the eye; *b*, the outer canthus drawn in by the ligamentous attachment of the tarsal cartilage to the temporal side of the orbit.



View of the internal surface of the right eyelid and lachrymal gland.

a, Conjunctiva propria, or mucous lining of the lid. The edges of the fold which passes to the sclerotic are seen loose and floating; *b*, lachrymal gland; *c*, orifices of the lachrymal ducts; *d*, tendon of the elevator muscle of the upper lid; *ee*, parallel rows or clusters of the Meibomian glands; *f*, the semilunar fold of the conjunctiva at the inner canthus, which is the rudiment of the third eyelid of birds and other animals. Near *f*, on the right, are seen the two puncta lachrymalia.

this muscle, which is called the *orbicularis*, is to close the lids; and it is capable of acting under certain circumstances with great force. It is collected at the inner angle or canthus of the eye into a round short tendon, which is attached in that situation to the bone. Elsewhere it is connected with the skin, and aponeurotic expansions of the face and forehead. It is also connected with the *occipito-frontalis muscle*, which elevates the eye-brows, and with the *corrugator supercilii*, which wrinkles and knits them in the act of frowning. A person acquainted with mechanics will have no difficulty in perceiving the advantage derived from the oblique, or, as it might almost be called, the *incidental* action of the orbicularis in closing the lids, to the edges of which its fibres are parallel. A more direct application of muscular force would have been more powerful; but the actual arrangement secures a rapidity incomparably more conducive to the function of the eyelids, which is to cleanse and moisten the surface of the eye.

Levator Palpebræ superioris. Below the orbicularis, in the upper lid, is the broad tendon of the muscle which elevates the upper lid. (*Figs.* 13, *d*; 10, *g*.) This muscle arises from the edge of the optic foramen, just above the rectus superior, and passing over it along the roof of the orbit, forms the thin tendon we have mentioned, which is inserted into the inner surface, or rather the thin upper edge of the tarsal cartilage. There is no such provision for depressing the lower lid, which is rendered unnecessary by its inferior extent. Moreover the muscle we have just described sufficiently answers the purpose, by pressing down the globe and causing it to slide a little forwards; as may be easily felt if a finger be placed against the lower lid when the eye is closed, and suffered to remain while the upper lid is slowly raised.

Meibomian Glands. (*Fig.* 13, *e e*.) Between the tarsus of either lid and the conjunctiva are disposed numerous vertical rows of minute whitish grains, which appear through the semi-transparent mucous membrane, and occupy an elliptic space, taking both lids together, of about half an inch in width, exactly in front of the globe. These are called the Meibomian glands, from their discoverer. They secrete an unctuous matter which passes into tubes centrally placed in each row, and exudes from as many minute orifices on the ciliary margin of the lid. (*Fig.* 11, *c*.) There are about forty of these parallel clusters in the upper lid: in the lower there are not so many, nor are they individually so long. We need not dilate upon the use of this secretion, which often collects in a sensible quantity upon the edges of the lids during sleep, especially when the glandular action is excited by slight inflammatory irritation of the part. The palpebral conjunctiva, already described, immediately covers these glandular corpuscles. The *caruncle*, a small red prominence at the inner angle of the eve (*Fig.* 11, *d*) consists of a number of similar bodies.

a, The two puncta leading into the lachrymal ducts; *b*, the common entrance of these ducts into the lachrymal sac; *c*, the head of the lachrymal sac; *d*, the narrow portion of the sac, or membranous lachrymal canal passing downwards to the nose; *e*, the lachrymal gland.

Lachrymal Apparatus. (*Figs.* 13, 14.) At the upper and outer part of the interior of the eyelid are several minute orifices (*Fig.* 13, *c*), generally seven in number, arranged in a half-circle, which lead into the secretory ducts of the lachrymal gland. (*Fig.* 13, *b*; 14, *e*.) This is a white flattened lobulated body, of the size of a large bean, lodged in a depression just within the margin of the orbit, and covered externally by the orbicular muscle. The function of this gland is to secrete the tears; and is probably always going on, although not in a degree sufficient to be remarked, except in weeping, or when some foreign body or acrid vapour stimulates the surface of the eye, and by sympathy excites the gland to unusual secretion.

The involuntary actions of the rectus externus and inferior oblique muscles, to which we have alluded, are supposed to have a relation to the lachrymal secretion. In the act of winking, the eye-ball is thrown up in an outward direction, as it would be by the action of these muscles, which not only brings the cornea into the vicinity of the ducts, but makes pressure upon the gland, while it relatively increases the rapidity with which the lids, drawn in winking towards the fixed nasal tendon are swept over the surface of the globe. That there is such a movement, however produced is certain: the motion of the prominent cornea may be felt by the finger gently pressed upon the half-shut lid if it be completely and suddenly closed. The approximation of the lids towards the nose in winking is one of several provisions by which offending particles or superfluous fluids are brought to the inner canthus of the eye to be protruded or absorbed. In this situation there is a vacant space partly occupied by the caruncle, called the *lacus lachrymalis* (*Fig.* 11, *d*); it is a sort of reservoir or rather *sink* for the tears. Above and below, at the entrance to this space where the ciliary margins terminate, there is a small prominence on the inner edge of both, (*Fig.* 11, *a*; 14, *a*,) centrally punctured by small orifices. These are the *puncta lachrymalia*. Their inward aspect is well shown in *Fig.* 13. They are the emunctories of the

eye; and their function is to absorb the fluids presented to them, and convey them by two converging canals (*Fig.* 14, *a*) to the *lachrymal sac* (*Fig.* 14, *c*), which they enter by a common orifice, (*Fig.* 14, *b*). This is a membranous bag about as large as a kidney-bean lodged in a groove in the lachrymal bone, behind the tendon of the orbicular muscle. The lachrymal sac entering a vertical channel in the bone at the end of the groove is narrowed into the *lachrymal canal* (*fig.* 14, *d*), and passes directly downwards into the inferior meatus or chamber of the nose which it enters on the outer side by a slit in the mucous lining. It is not exactly understood in what way the puncta absorb,—whether by capillary attraction or by some vital force of suction. The side of the lachrymal sac is connected with the tendon of the orbicularis, which may aid in producing the effect by suddenly drawing its membranous surfaces apart. We all know the effect of repeated winking when the eyes are filled with tears.

Nervous and vascular constitution of the Eye.—Enough has been already said, for general information, with respect to the blood-vessels distributed to the eyeball, and it is not necessary to mention those which supply the appendages. With respect therefore to vascular arrangements we have only to add, that although there are abundant proofs of the existence of an active absorption within the globe, no lymphatic vessels especially destined to that function have been hitherto found in it. The optic or second cerebral nerve has been already described. All the straight muscles, with the exception of the rectus externus, the inferior oblique, and the levator palpebræ, are supplied by the third nerve. The fourth is wholly distributed to the trochlearis, and the sixth to the rectus externus. The orbicular muscle is supplied, like most of those of the face, by the *portio dura* of the seventh pair. All these, except the optic, are muscular or motor nerves. The fifth nerve supplies the whole organ in common with many other parts with ordinary sensation. Any account of the intricate nervous constitution of the iris would be here quite out of place. The third and sixth nerves are mainly concerned in it. Thus of the ten cerebral nerves, the second, third, fourth, and sixth are wholly, and the fifth and seventh partially distributed to the organ of vision; a fact which may give some idea of the elaborate organization and varied exigencies of the parts which compose it.

Comparative Anatomy of the Eye.—The eyes of insects and many other articulated animals, often consist (as we have mentioned before) of myriads of simple eyes grouped in one compound organ. The eye of the lobster is said to contain at least 5,000. Such organs are commonly placed one on each side of the head. The horny, rounded, naked, and transparent part seen externally represents the cornea. Its surface when viewed by the microscope displays as many hexagonal *facettes* as the organ contains simple eyes. Beneath each facette is applied the base of a minute transparent cone which constitutes the lens. These cones are arranged side by side with their acute angles directed inwards to the terminations of as many fibrils of an optic nerve. A choroid pigment is spread beneath, and often separates the lenticular cones. Vestiges of the aqueous and vitreous humours are also frequently present. When the eyes are simple, as in the spiders, there are generally several, from two to twelve, placed on different parts of the head and thorax. The lens is of the usual spherical shape, hard and sparkling, and highly refractive. In fish and other aquatic animals the lens is dense, hard, and spherical, to make up in refractive power for the density of the medium through which light reaches the eye. On the other hand the cornea is flat, and there is little aqueous humour. Such provisions would be of no value; for as the refractive power of water is the same as that of aqueous humour, rays penetrating the surface, however shaped, would pass on in the direction of their entrance. Fish are unprovided with eyelids, and the eyeball has but little independent motion. There is a red gelatinous structure near the optic nerve between the layers of the choroid, the use of which is unknown. It is called the choroid gland. The ciliary body and processes are generally absent; but there is a rudiment in the eyes of fish of that part called the *pecten* in birds.

The eyeballs of quadrupeds and other mammalia resemble the human organ in structure, and differ from it, but not essentially, in form. This is not the case with the appendages. One of the most remarkable additions commonly found to the parts we have described is that of a strong retractor muscle in the shape of a hollow cone attached at the apex to the bottom of the orbit, and by the marginal base to the sclerotic, which it embraces, lying under the recti muscles. Its use is to draw back the eye in the orbit; a gesture which gives a very peculiar expression of hollowness to the organ in beasts of prey.

We subjoin the following account of the eye of the common owl (*strix bubo*), chiefly for the purpose of explaining the *pecten* and the curious mechanism of the third eyelid, or *nictitating membrane*, in birds.

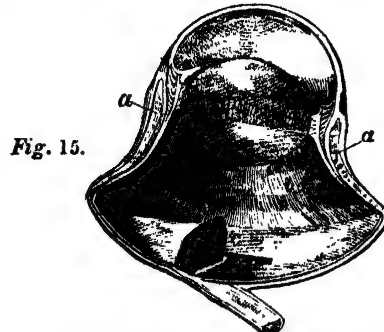


Fig. 15.

Horizontal section of the eye of an owl (strix bubo).
a a, Bony plates in the sclerotic; *b*, ciliary body; *c*, pecten.

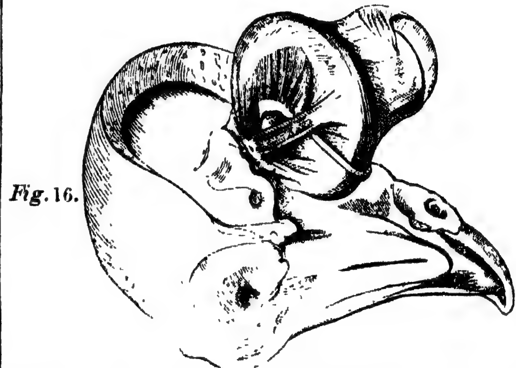

Fig. 16.

Head of the same bird. A portion of the bony margin of the orbit having been removed, the eyeball is turned forward so as to show the recti and other muscles.

The general shape of the organ represented in the annexed figures resembles a bell. This arises from the disposition of a series of quadrangular bony scales (*fig.* 15, *a*) within the substance of the sclerotic, concave on their outer aspect, and overlapping and accurately fitted to each other. The rigidity thus communicated to the external case which contains the fluid media prevents their pressure from distending the eye into a spherical shape. The ciliary body (*fig.* 15, *b*) extends over the whole of this portion of the surface. A curious membrane called the *pecten* or comb (*fig.* 15, *c*), from some resemblance to that implement, projects through the choroid into the vitreous humour, and in some birds is attached to the side of the lens. In the owl it is comparatively short. It resembles a quadrangular piece of choroid folded backwards and forwards upon itself like the paper of a lady's fan. Of its use little is known. The foramen of Soemmering, described in the account of the human retina, is thought to be a rudiment of the pecten. In birds the retina has *generally* the yellow colour seen only *partially* in man round the central spot miscalled a *foramen*.

At the back of the globe there are two muscles which originate from the sclerotic, and are applied to its curved surface round the entrance of the optic nerve (*fig.* 17, *a*). The larger represents rather more than half of what if completed would be a broad circular ring (*fig.* 17, *b*). It is called the *Quadratus*. Attached by its wider edge near the margin of this part of the sclerotic, its fibres converge to the narrower edge, and terminate in a narrow tendon (*fig.* 17, *c*), perforated through its whole length like the hem of an apron. The second smaller muscle, called the *pyramidalis* from its shape (*fig.* 17, *d*), at an opposite part of the circumference. Its fibres converge, and are fixed into a long round tendon (*figs.* 17 and 18, *e*), which passes through the loop or *hem* (*c*) of the Quadratus, and hence turning over the edge of the broad part of the sclerotic, is continued along the

Fig. 17. Fig. 18.

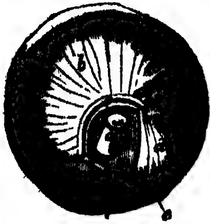

Fig. 17. Posterior view of the sclerotic of the same bird, showing the muscles of the nictitating membrane. a. Optic nerve; b, quadratus muscle; c, its looped tendon; d, pyramidalis muscle; e, its tendon—having passed through the loop in that of the quadratus—turning over the edge of the sclerotic.

Fig. 18. Lateral view of the same part. e, The tendon of the pyramidalis, attached to the concave part of the sclerotic by tendinous loops, and passing round a prominent bony tubercle, is seen inserted into the nictitating membrane at f.

surface of its bell-shaped portion, where it passes through several thread-like loops or pulleys which keep it applied to the concavity, and round a bony point which projects from the surface, and is attached near the edge of the cornea to the edge of an elastic fold (*fig.* 18, *f*) of the conjunctive which is called the third eyelid or nictitating (i. e. *winking*) membrane. It will be easily seen by the help of the figures, from this description, that the effect of the simultaneous contraction of the two muscles will be to draw the membrane with great rapidity, making it sweep over the surface of the cornea. It returns by its own elasticity with nearly equal quickness. A bird may be seen to use this mechanism twenty times in a minute; in fact, as often as it may be necessary to cleanse the surface of the eye. The colour of the membrane is milky; and it is seen to pass from the upper and inner to the outer and lower corner of the eye with the speed for which the act of *winking* is proverbial. There is a rudiment of this third eyelid in the human organ. It is a small crescentic fold of conjunctiva situated at the inner canthus behind the caruncle. (*Fig.* 13, *f*.) The *haw* is also a rudiment of it, in the eyes of quadrupeds; it is occasionally forced out by the pressure of the globe against the nasal side of the orbit, being unprovided with muscles.

Seat of Vision.—The retina in one sense is not the seat of vision. It is necessary to the perception that the impression of light should be received on another part not endowed with sensibility, namely the surface of the choroid; and that the vibration or other effect thus impressed should be transferred to the retina in front of that surface; for where the choroid is deficient at the entrance of the nerve, there is no perception of light. This may be easily shown by a very common and conclusive experiment. If two discs of white paper be fixed upon a wall at the distance of two feet from each other, and an observer, having closed one eye (the left), continues to gaze attentively at the left-hand disc, at the same time slowly retreating from the wall, he will for a time continue to see them both; the rays from the right-hand object entering of course laterally, and impinging upon the retina nearer and nearer to the entrance of the nerve as he goes backward. At length when he has reached the distance of about 6½ feet from the wall, the right-hand object will suddenly disappear, and remain invisible (the observer still retreating) till he has gained a distance of about eight feet. During this period the spectrum has been passing over the circular aperture in the choroid through which the nerve enters. The insensible portion of the retina is found to extend horizontally over five degrees and a half of the angular range of vision. The eyes are generally unequal in power, and the experiment succeeds best in the weaker organ, in which the obscuration is more sudden and complete. In the experiment previously mentioned, showing the distribution of the central artery of the retina, the surface of the choroid is faintly illuminated through the transparent nervous expansion by what is called the *dispersion* of part of the light admitted through the pupil; but the rays thus scattered are locally intercepted by the opaque blood contained in the minute branches of the artery; hence, after several repetitions, when the eye has become accustomed to neglect the taper, and attend to the fainter internal illumination, the *shadow* of the vascular net-work upon the choroid becomes perceptible in dark lines.

Apparent direction of objects seen obliquely.—A body in motion, as a ball, striking the surface of another, impresses it in a line perpendicular to the surface at the point of impact. This rule appears to hold good with respect to the action of light upon the retina. Indeed if impressions of any kind be made upon it, the sensation is that of light, and the direction suggested is that of a line joining the centre of the sphere of which the retina forms a part with the point impressed,—in other words, a line perpendicular to it. This may be shown in several ways: if we excite the nerve by pressing far back upon the eyeball with the finger nail, especially if the eye be closed or light otherwise excluded, a bright ring appears to be seen in a diametrically opposite quarter.

Erect Vision.—If the sclerotic and choroid be carefully removed under water from the back of an eye, an inverted picture of any object held before the cornea is seen upon the now milky surface of the retina. Hence the celebrated question raised in the age of philosophical barbarism, how is it that we see objects erect when the image on the retina is inverted? The question is an idle one, which is perhaps hardly worth answering. The mind judges of the apparent place of objects or of parts of an object by the *direction* of the impressions made upon the retina, not by the part of it which may happen to be affected by these impressions. The shadow of the central artery is an example of an impression necessarily received always upon the same parts; yet the *apparent*, or in other words the *relative*, place of the shadow will be found to vary with every movement of the eye.

Single Vision.—Another question, not so trivial as the last, has been raised with respect to single vision with *two* eyes, as the impression must be twofold. But perhaps it will not require an answer if the reader will try to imagine double vision of the same object, or rather of the same *point*, for the question resolves itself into that. Let the two supposed images approach each other, still remaining double, till they are in contact. Another step in the imaginary approximation, and they are one. The truth is, that both eyes see the object in the same place; and as two images, no more than two material substances, can occupy the same place at the same time, the impressions coincide and are single.

Diseases of the Eye.—We shall content ourselves in speaking of the diseases of the eye, with a few remarks which may serve as an index to the separate articles upon the most important of those diseases.

Blindness may be produced in various degrees by injury or disease of the retina, as by lightning. Such affections are technically known as *amaurosis*, but will be mentioned under the more familiar title of GUTTA SERENA. The sight may also be lost by anything which destroys the transparency of any of the refracting media. [CATARACT; GLAUCOMA; LEUCOMA.] Closure of the pupil is of course attended with loss of vision. It arises from diseases of the iris and may sometimes be remedied by an operation. Information with respect to inflammations and other diseases of the iris, sclerotic, and choroid, will be found under GOUT; IRITIS; PUPIL, ARTIFICIAL; RHEUMATISM; SYPHILIS. Inflammatory and ulcerative affections of the conjunctiva, whether of the eye or lid, are called OPHTHALMIA. The diseases of the lachrymal organs, and a peculiar paralytic affection of the muscle which elevates the upper eyelid will be mentioned respectively under the heads of FISTULA LACHRYMALIS and PTOSIS. Almost all affections of the eye, whether they result from injury or spontaneously, are liable to be extended from one eye to the other, so close is the sympathy between these organs. When the contents of the eyeball have been by any means evacuated, which may arise either from accident or disease, or operations which disease sometimes renders necessary, the sclerotic shrinks into a tubercle at the bottom of the eye, which produces of course a very unsightly effect, as well as no little inconvenience. It is common in these cases to resort to the introduction of what is called an artificial eye, consisting of a smooth shell of glass or enamel, suited in size and shape to the circumstances of the case, and coloured in exact imitation of the remaining organ. It is difficult when this is well made to distinguish it from a natural eye, and the illusion is much more complete from the circumstance that the muscles, still attached to the shrunk sclerotic, are capable of moving the artificial eye in correspondence with the other to an extent which would hardly be believed.

EYE (in Optics). [LIGHT; OPTICS.]

EYE, in horticulture, the name technically given to the bud of a plant.

EYE. [SUFFOLK.]

EYEMOUTH. [BERWICKSHIRE.]

EYLAU, more properly **PREUSSISCH-EILAU** (Prussian Eilau), is a circle in the Prussian administrative circle of Königsberg, having an area of about 460 square miles, which is partially wooded, is well cultivated, and has good pasture land and productive fisheries on its western boundary, the Frische Haff. Population about 37,000.

Preussisch-Eilau, the chief town, built in 1336, is situated on the Pasmer, in 54° 25′ N. lat. and 20° 35′ E. long. It has an old castle, a church, about 200 houses, and about 2150 inhabitants, who manufacture woollen cloths, hats, leather, &c. The name it bears has been given to it in order to distinguish it from Deutsch-Eilau, a town in the Prussian administrative circle of Marienwerder. An obstinate engagement took place near Preussisch-Eilau between the French forces under Napoleon and the Russian under Bennigsen on the 7th and 8th February, 1807. After the combatants had lost 30,000 in killed and 50,000 in wounded, they withdrew their troops from the field.

EYRE (from the old French *eyre*, a journey), the court of the justices itinerant who were regularly established, if not first appointed by the parliament of Northampton, A.D. 1176—22 Hen. II.—with a delegated power from the king's great court, or Aula Regis, being looked upon as members thereof. They were first appointed to make their circuit round the kingdom once in seven years, but by Magna Charta, c. 12, it was provided that they should be sent into every county once a year. Their jurisdiction and mode of proceeding are laid down 4 Inst., 184. These judges itinerant have been long superseded by the modern justices of assize. There was also a court so called which was held before the chief justices of the several forests, under the old Forest Laws. These courts were instituted A.D. 1184 by Hen. II., and were formerly very regularly held; but the last of any note that was holden was in the reign of Charles I., before the Earl of Holland, the rigorous proceedings at which are reported by Sir William Jones (Jones, i. 266). Charles I. endeavoured to make these odious forest laws a source of revenue independent of the parliament; and though, after the Restoration, another Court of Eyre was held before the earl of Oxford (North's *Life of Lord Guildford*, 45), it was merely *pro formâ*, and since the Revolution, 1688, they have fallen into total disuse. There are still two officers appointed by letters patent (4 Inst. 291), who are called Chief Justices in Eyre, the one south, the other north, of Trent, whose deputies perform some trifling and harmless functions connected with the royal forests in their respective districts:—the offices themselves are sinecures.

EZEKIEL, the Book of the Prophet, is a canonical book of the Old Testament, divided, in our English version, into 48 chapters, and placed next after Jeremiah's Book of Lamentations, and before the book of Daniel. Ezekiel was partially contemporaneous with Jeremiah, and is one of the prophets called 'The Greater,' a distinction which relates to the comparative magnitude and importance of their books. He was a priest, the son of Buzi (i. 3), and, according to the account of his life ascribed (erroneously) to Epiphanius, he was born at a place called Saresa. In the first Babylonian captivity he was carried away by Nebuchadnezzar into Mesopotamia, with the Kings Jeconiah and Jehoiachim, and all the principal inhabitants of Jerusalem, who were stationed at Tel-abib (iii. 15) and at other places on the river Chebar (i. 1, 3), the Chaboras of Ptolemy, which flows into the east side of the Euphrates at Carchemish, about 300 miles north-west of Babylon. He is stated to have commenced his prophesying in the fifth year of his captivity (i. 2), about B.C. 598, and to have continued it during more than 22 years, that is, until the fourteenth year after the destruction of Jerusalem by Nebuchadnezzar. The pseudo-Epiphanius says that Ezekiel, on account of his aversion to adopt the Chaldæan idolatry, was put to death by the Jewish prince or commander of the captives. Rabbi Benjamin of Tudela states that his tomb is between the Euphrates and the Chebar, in a vault built by King Jehoiachim, and that within it the Jews keep a lamp perpetually burning. The same writer asserts, with equal appearance of traditional falsehood, that the Jews possess the book of Ezekiel in the original autograph, which they read every year on the great day of expiation. Greatly inconsistent with such veneration is the fact related by Calmet, that the Jews speak of this prophet very contemptuously as having been Jeremiah's servant boy, and the object of popular ridicule and raillery, whence his name 'son of Buzi' (בוז *buz*, contempt). Josephus speaks of two books of Ezekiel, but commentators understand him to mean the present book, divided at the end of chapter xxxix., for the nine remaining chapters are distinctly different with regard both to subject and style. The first 39 chapters are occupied with the prophet's highly poetic and impassioned announcement of God's wrath and vengeance against the rebellious idolatry, perverseness, and sensuality of the Jews, as well as against their enemies, the surrounding nations. All this portion is replete with dreadful pictures of the calamities of war—of ruin, desolation, death, and destruction—slaughter, pestilence, famine, and every imaginable state of misery; but in the nine chapters of the latter portion the prophet describes, in a more prosaic style, his visions of the new temple and city of Jerusalem. In visionary presence he walks about the holy metropolis of Judæa as raised from its ruins in which it was left by the Chaldæan conqueror, and restored to the splendor which it displayed in the reign of Solomon. He measures and observes minutely all the dimensions of the Temple and city; gives directions for the celebration of sacrificial rites, feasts, and ceremonies; partitions the country among the several tribes; and enumerates the duties of priests, king, and people. Dr. A. Clarke, in his edition of the Bible, gives a plate of the Temple according to Ezekiel's description, and a map of Judæa as allotted by this prophet to the different tribes. A full and particular analysis of the contents of the whole 48 chapters is given in Mr. Horne's 'Introduction to the Bible.' The following is a brief and general survey. Chapters i. to iii. (and see chap. 10) describe the vision of the wheels and cherubim, called 'Jehovah's Chariot,' and the prophet's reception of the divine instructions and commission. Chapters iv. to xxiv. reiterate reproaches and denunciations against the Israelites and their prophets, announcing, in various visions and parables, the numerous calamities about to come upon them as a punishment of their rebellious idolatry and depravity. The species of idolatry adopted by the Jews in preference to the religious system of Moses appears, by the declarations of Ezekiel and the other prophets, to have been Sabism, or the worship of the sun on high places planted with trees. (See chapters viii. xiv. xvi. xvii. xx. xxviii. &c.) Dr. A. Clarke quotes Palladius 'De Re Rustica' to show that the 'tile' (iv. 1) on which the prophet portrayed the city of Jerusalem was a brick, two feet long and one foot broad, and he supposes that the mimic apparatus of war (v. 2) were made by the prophet with clay. The 390 years signified by the prophet's lying as many days (v. 4 and 5) on his left side, are said by biblical chronologists to be the period from B.C. 970 to 580; and the 40 years signified by his lying 40 days on his right side (v. 6) is the period from B.C. 580 to 540. Concerning the fact of baking bread with human and other excrement (v. 12 and 15), see Calmet's Dict. by Taylor, vol. iii.; Fragments, p. 9, &c., where the oriental custom of using dung for fuel is explained. Chapters xxiv. to xxxii. declare the dreadful judgments of God against the enemies of the Jews, namely, the surrounding nations of Ammonites, Moabites, Edomites, and Philistines; against the cities of Tyre and Zidon; and against all the land of Egypt. It may suffice to remark here that all these manifestations of the divine anger towards the nations of Palestine, Phœnicia, and Egypt, relate to the slaughter and devastation which attended the conquests of Nebuchadnezzar, king of Babylon; and that in order properly to understand the prophet's descriptions, it is necessary to consider particularly the circumstances and character of the Jews, and all the collateral history of the period. Of these an abstract is given by Bishop Newcome in the Introduction to his Translation of Ezekiel, and more particular and critical accounts are supplied in the scholia and prolegomena of the various commentators named at the end of the article.

Chapters xxxiii. to xxxvii. are occupied with declarations of the justice and forgiveness of God to the repentant—the fall of Jerusalem—a severe rebuke (chap. xxxiv.) of the avarice, idleness, and cruelty of the shepherds or priests of Israel—and consolatory promises of the people's restoration and return to Palestine. Chapters xxxviii. and xxxix. contain the Prophecy of Gog and Magog; and the nine concluding chapters, as already

stated, contain the prophet's visions of the temple and city of Jerusalem—their dimensions, structure, embellishments, &c.—the ceremonial arrangements of the hierarchy, and the allotment of the land of Judæa among the several tribes on their return from captivity. The subject matter of Ezekiel is, for the most part, identical with that of his contemporary Jeremiah, and much similarity is observable in their declarations. The conquests and devastations of Nebuchadnezzar form the principal theme of each; but Ezekiel views them chiefly as affecting Israel, while Jeremiah describes them with especial reference to Judah. Both declaim with vehement indignation against the depravity of the priests, and against the 'lying divinations' of the prophets who sought to induce the people to shake off their Babylonian slavery. (Compare Jeremiah, chapters xxiii., xxvii., xxviii., xxix. with Ezekiel, chapters xiii., xxxiv.) Parts of the book of Revelations may be compared with some portions of Ezekiel: Rev. iv. with Ezek. i. and x., respecting the cherubim with wings full of eyes; and Rev. xi., xxi., xxii., with Ezek. xl. to xliii., describing the New Jerusalem.

That Ezekiel is a very obscure writer is asserted by all who have attempted to explain his prophecies. The antient Jews considered them as inexplicable, and the council of the Sanhedrim once deliberated long on the propriety of excluding them, on this account, from the canon (Calmet, præf. ad Ezech.); but to prevent this exclusion Rabbi Ananias undertook to explain completely the vision of Jehovah's chariot (i. and x.). His proposal was accepted by the council, and in order to enable him to accomplish his task without interruption they furnished him with 300 barrels of oil to supply his lamp during the course of his studies. Dr. Adam Clarke relates this marvellous anecdote in his Comment on the Bible, and in repeating it in his 'Succession of Sacred Literature,' he says the quantity of oil was 300 *tons*. It was also alleged as a reason for rejecting Ezekiel from the canon that he teaches, in direct contradiction to the Mosaic doctrine, that children shall *not* suffer punishment for the offences of their parents (xviii., 2-20). (See Hueti 'Demonstratio Evang., prop. 4, de Prophet. Ezech.') St. Jerome considers Ezekiel's visions and expressions very difficult to be understood, and says that no one under the age of 30 was permitted to read them. (Hieron. procm. in lib. Ezech.) It is astonishing, says Dr. Clarke, how difficult it is to settle the text by a collation of MSS.; and, in accordance with the opinion of many other interpreters, he adds, that much remains to be done to restore the original Hebrew text to a state of purity. Michaelis, Eichhorn, Newcome, and many other commentators, have written copiously on the peculiarities of Ezekiel's style. Grotius (Præf. ad Ezech.) speaks of it with the highest admiration, and compares the prophet to Homer. Michaelis admits its bold and striking originality, but denies that sublimity is any part of its character, though the passion of terror is highly excited. Bishop Lowth (Prælect. Heb. Poet.) regards Ezekiel as bold, vehement, tragical; wholly intent on exaggeration; in sentiment fervid, bitter, indignant; in imagery magnificent, harsh, and almost deformed; in diction grand, austere, rough, rude, uncultivated; abounding in repetitions from indignation and violence. This eminent judge of Hebrew literature assigns to the poetry of Ezekiel the same rank among the Jewish writers as that of Æschylus among the Greeks; and in speaking of the great obscurity of his visions, he believes it to consist not so much in the language as in the conception. Eichhorn (the peculiar character of whose criticism we have noticed under that article) regards the Book of Ezekiel as a series of highly-wrought and extremely artificial poetical pictures. No other prophet, he says, has given such freedom to imagination. 'Every thing is dressed in fables, allegories, and visionary poetry. He is so used to ecstasies and visionaries that he adopts their appropriate language when he has no vision to describe.' In accordance with the doctrines of the German rationalism he considers the prophecies as nothing more than the poetical fictions of a heated oriental imagination of a similar nature with the poetry of the book of Revelations. A remarkable characteristic of the poems of Ezekiel, observes the same critic, is the painful detail and minuteness of his descriptions. He considers the prophet as a great original poet, but from his turgid and hyperbolical style he assigns him to the *silver* age of Hebrew literature.

In rude indignation, violent energy, and disregard of delicacy and disguise, the denunciations and descriptions of Ezekiel are said by Dr. Clarke to resemble the satires of Juvenal. The same character of thought and expression is exhibited in the writings of the two other Greater Prophets, Isaiah and Jeremiah. (Compare Ezek. xvi. 4 to 37; xxiii. 17-21; Isaiah, xxviii. 7, 8; xxxvi. 12. Ezekiel's remarkable prophecy of Gog and Magog, xxxviii. and xxxix., has always been a subject of learned controversy, and the explanations are nearly as numerous as the expositors. However, only two appear to possess any considerable probability. Gog, according to the first, was Antiochus Epiphanes; according to the second, he was Cambyses, king of Persia. In modern times it has been elaborately shown by Mr. Granville Penn that Gog is to be recognized in the person of the Emperor Napoleon, and Magog in the people or nation of France. His treatise on the subject, entitled 'The Prophecy of Ezekiel, concerning Gogue, the last tyrant of the church,' &c., published in 1815, is a production replete with curious learning and argumentative ingenuity.

The most learned and elaborate commentary on Ezekiel is by two Spanish Jesuits, Pradus and Villalpandus, in 3 vols., folio.)

EZEKIEL. [DRAMATIC ART AND LITERATURE.]

EZRA, the Book of, is a canonical book of the Old Testament, placed next after the second book of Chronicles and before the book of Nehemiah, and, in the English version, is divided into ten chapters. By Jews and Christians it has generally been attributed to the priest whose name it bears, chiefly because throughout chapters viii. and ix. the actions of Ezra are related in the first person. He is supposed to have written the two books of Chronicles and the book of Esther. It is remarkable that the first two verses of Ezra and a part of the third form the conclusion of the second book of Chronicles. [CHRONICLES.] Ezra, Esdras, or Esdra in the Hebrew is עזרה, *azrh*, signifying 'help' or 'succour.' His genealogy up to Aaron is given in chap. vii. 1-5. In verses 6 and 11 he is said to have been a priest and ready scribe of the words of the law of Moses; and he appears to have been an able and important agent in the principal events of his age and nation. The prophets Haggai and Zechariah were contemporary with Ezra. (Compare Hagg. i. 12, Zech. iii. 4, and Ezra v.) There are four books of Ezra so called; namely, the canonical one bearing his name, the book of Nehemiah, which by the antient Jews and by the Greek and Roman churches is considered as the second book of Ezra, and two books of Ezra or Esdras in the Apocrypha. The first of the two apocryphal books contains the substance of the canonical one, with many circumstantial additions, and in the Greek church it is read as canonical; but the second exhibits a more decided appearance of fiction, and by no church is regarded as a work of inspiration, though it is cited by several of the antient fathers. The first six chapters of the canonical book are regarded by some biblical critics as improperly ascribed to Ezra, for between the event with which the seventh chapter commences, that is, the commission from Artaxerxes Longimanus, in the seventh year of his reign, to Ezra to go up to Jerusalem, B.C. 458, and that which terminates the sixth chapter, namely, the completion of the second temple, in the sixth year of the reign of Darius Hystaspes, B.C. 516, there is a chasm of fifty-eight years. The events recorded in the whole ten chapters of the canonical book of Ezra embrace a period of ninety-one years, that is, from the edict of Cyrus issued in the first year of his reign, B.C. 536, for the return of the captive Jews to Jerusalem, to the termi-

nation of Ezra's government by the mission of Nehemiah to Jerusalem from Artaxerxes Longimanus, in the twentieth year of his reign, B.C. 445. As Daniel's seventy prophetic weeks commence at the going forth of the edict of Cyrus to Zerubbabel or of that of Artaxerxes to Ezra, these events have been the subject of much critical investigation among biblical critics.

The contents of the first six chapters are briefly as follow. Chap. i. gives an account of the proclamation of Cyrus concerning his release of the captive Jews, permitting them to go from Babylon to Jerusalem to rebuild the temple; of the restoration of their property, sacred vessels and utensils; and of presents made by the Chaldæans of money and various provisions. Chap. ii. states the numbers of each of the families composing the multitude which returned to Judæa with Zerubbabel, and the number of their beasts of burden. All this account, excepting some of the numbers, is repeated word for word in the seventh chapter of Nehemiah, beginning at ver. 6. In ver. 64 and 65 of Ezra, the total number of the people is said to have been 42,360, which appears not to agree with the preceding particulars, since the addition of these produces only 29,818, that is, a deficiency of 12,542. The numbers given in Nehemiah occasionally differ very widely from those in Ezra: for instance, the children of Azgad are said in Ezra (ii. 12) to have been 1222; but in Nehemiah (vii. 17) they are said to have been 2322, or 1100 more. Nehemiah repeats precisely the total given by Ezra, 42,360; but the addition of Nehemiah's particular numbers makes 31,089, or a deficiency of 11,271. The numbers of horses, 736, mules 245, camels 435, and asses 6,720, exactly agree in the two accounts; but in Ezra, ver. 69, the chief fathers give to the treasury 61,000 drams of gold; in Nehemiah, ver. 71, they give only 20,000. Chap. iii. records the events of setting up the altar at Jerusalem and re-establishing the Jewish sacrificial worship. An account of the interruption of the building of the Temple by the decree of Artaxerxes, and its completion by a subsequent decree of the same monarch, with transcripts of the documents written on these occasions, occupy chapters iv., v., and vi. Chapters vii. and viii. contain an account of Ezra's commission from Artaxerxes to undertake the government of Judæa, his preparations and reception of presents for his journey thither, with a multitude of Jews, who it appears still remained in Babylon after the return to Judæa of the multitude under Zerubbabel; an enumeration of the people and families who returned, and the weight of gold and silver contributed by the king, his councillors, and the Israelites, for the use of the Temple at Jerusalem (viii. 25-28). The value of these presents amounts to 803,600*l*. Chapters ix. and x. relate the proceedings of Ezra in separating from their wives and children all the Israelites who had married women from among the surrounding nations, and thus 'mingled the holy seed with the abominations of the Gentiles.' Ezra (x. 3, 5, 19, 44) made all the Israelites who had 'strange wives and children' swear, and give their hands, that they would put them away, which accordingly was done. The latter half of the last chapter contains a long list of the husbands and fathers who were the subjects of this national renovation. The part from iv. 8 to vii. 27 is written in the Chaldee idiom, the rest in Hebrew. The period to which the four last chapters relate, comprising the Jewish history from B.C. 458 to B.C. 445, is coeval with the age of Pericles. The subject matter of the book of Nehemiah being identical with that of Ezra, the collation of the two affords a mutual illustration. Chapter viii. of Nehemiah relates circumstantially the fact of Ezra's solemn reading and exposition of the law to the assembled Israelites, who, according to Dr. Prideaux, were taught the signification of the Hebrew words by means of Chaldaic interpreters (8); for, since their seventy years' captivity in Babylon, the Chaldee instead of the Hebrew had become their vernacular language. (Dean Prideaux's *Connection*, fol., p. 263.) The critical arguments adduced in opposition to the opinion that the Israelites lost the Hebrew language, and understood only the Chaldæan, are well exhibited in Dr. Gill's learned 'Dissertation on the Antiquity of the Hebrew Language,' 8vo., 1767. The two principal undertakings of Ezra were—1. The restoration of the Jewish law and ritual, according to the modes observed before the captivity; and 2. The collection and rectification of the Sacred Scriptures. On account of these important services the Jews regarded him as a second Moses. It was commonly believed by the antient fathers of the Christian church that all the Sacred Scriptures of the Jews were entirely destroyed in the conflagration of the temple and city of Jerusalem by the king of Babylon, and that, on the return of the Jews from the Chaldæan captivity, these writings were wholly reproduced by a divine inspiration of Ezra. (See Irenæus, *Adversus Hæres*, l. iii. c. 25; Tertullian, *De Habitu Mulierum*, c. iii.; Clemens Alexandrinus, *Strom.* i.; Basil, *in Epist. ad Chilonem*.) The following passages from the second Apocryphal book of Ezra, xiv. 26, 45, 46, 47, appear to sanction this opinion. 'Behold, Lord,' says Ezra, 'I will go as thou hast commanded me, and reprove the people. The world is set in darkness, and they that dwell therein are without light, for *thy law is burnt;* therefore no man knoweth the things that are done of thee; but if I have found grace before thee, send the Holy Ghost into me, and I shall write all things that have been done in the world since the beginning, which were written in the law; And God said, Go, prepare to write swiftly, and when thou hast done, some things shalt thou publish, and some things shalt thou show secretly to the wise.' The learned Dr. Prideaux (*Connection*, p. 260, fol.) remarks, that 'in the time of king Josiah (B.C. 640), through the impiety of the two preceding reigns of Manasseh and Ammon (a period of sixty years), the book of the law was so destroyed and lost; that, besides the copy of it which Hilkiah, the high-priest, accidentally found in the Temple (2 Kings xxii. 8, &c.; 2 Chron. xxxiv. 14, &c.), there was then no other to be had; for Hilkiah's surprise in finding it, and Josiah's grief in hearing it read, do plainly show that neither of them had ever seen it before; and if this pious king and the high-priest were without it, it cannot be thought that any one else had it.' If this were the authentic copy laid up before the Lord in the Temple, it was burned, as believed by all Jewish and Christian writers, in the burning of the Temple, fifty-two years afterwards, by Nebuchadnezzar. Dr. Prideaux takes it to be implied in several passages which he cites that, from the copy accidentally found by the high-priest Hilkiah, some transcriptions were made previous to the destruction of the Temple, and that from these scattered copies Ezra formed his improved edition of the sacred text. In common with most other modern divines, he rejects the opinion of the fathers respecting the restoration of the Scriptures by a new revelation to Ezra, observing (p. 261) that 'it would very much shock the faith of many should it be held that the sacred writings owe their present being to such a revival; it being obvious for sceptical persons to object that he who is said thus to have revived them forged the whole.' All, he continues, that Ezra did was—'he got together as many copies of the sacred writings as he could, and out of them all he set forth a corrected edition, in which he took care of the following particulars:—1. He corrected all the errors introduced into these copies by the negligence or mistakes of transcribers; for, by comparing them, he found out the true reading, and set all to rights. 2. He collected together all the books of which the sacred Scriptures did then consist, disposed them in proper order, and settled the canon of scripture up to that time.' The Jewish writers state that the canon was decided by a congress of 120 elders under the presidency of Ezra; but since they mention as members of it, not only the contemporaries of Ezra, as Daniel, Shadrach, Meschech, and Abednego, but the high-priest Simon the Just, who lived 250 years later, it is evident that they mean the number of those who *successively* arranged and rectified the canonical books. Ezra divided all the books he collected into three parts; the law, that is, the Pentateuch; the prophets, containing all the historical and prophetical books; and the hagiographa, which comprised all the writings not included in the two other divisions. (Josephus, *advers. Apion.*) He divided the Pentateuch into 54 sections, one of which was read every Sabbath; and, according to the Jewish authorities, he was also the author of the smaller divisions called Pesukim, or verses, and of the various readings and suggested corrections inserted in the margins of the Hebrew copies. These, called Keri Cetib (that which is read and that which is written), appear however in the books attributed to Ezra himself. (On these particulars see the remarks of Prideaux; Buxtorf, *Vindiciæ Veritatis Hebraicæ*, par. ii. c. 4; Walton's *Prolegom.*, viii. § 18; and Dr. Gill's *Dissertation on the Hebrew Language.*) Most biblical critics state that Ezra changed the antient names of places for those by which these places were known

in his time, and some say that he wrote out all the Scriptures in the Chaldee character, which alone was used and understood by the Jews after the Chaldæan captivity. Whether Ezra added the vowel-points, and whether they were invented by the Masorite grammarians at a period far posterior to the rise of Christianity, are subjects of great controversy among Hebrew critics. A concise and able view of this dispute is contained in Houbigant's 'Racines Hebraiques,' 1732. The Jewish commentators assert that all the rules and observances preserved by tradition from the time anterior to the captivity were carefully collected by Ezra, and that having reviewed them, those which he sanctioned by his authority henceforth constituted the oral law, in contradistinction to that which is written; the church of Jerusalem, like the church of Rome, regarding Scripture and tradition of equal authority, and believing the latter to be highly necessary for clearing the obscurities, supplying the defects, and solving the difficulties of the former. (See the Rabbinical authorities cited by Dr. Prideaux.) It is a theory suggested by this learned divine, and since adopted by many others, that all the numerous passages of the Hebrew Scriptures which involve chronological inconsistencies were interpolations made by Ezra, and that this is the only possible way to solve the difficulties which arise from considering the several books as the productions of the persons to whom they are commonly ascribed. The Book of Ezra, with the two Books of Chronicles, Nehemiah, Esther, and Malachi, are supposed by Dr. Prideaux to have been added to the sacred canon by the high-priest Simon the Just, in the year B.C. 150.

INDEX TO THE LETTER E.

VOLUME IX.

VOLUME X

F.

F is a labio-dental aspirate bearing the same relation to the other labio-dental aspirate V which the letters called *tenues*, *p*, *k*, *t*, bear to the *mediæ*, *b*, *g*, *d*. It occupies the sixth place in the English as in the Latin alphabet, thus corresponding with the digamma of the old Greek alphabet, and the vau of the Hebrew. In power and form it is likewise closely related to those two letters. [ALPHABET.]

The letter F is interchangeable with the other aspirates *ch* or *h* and *th*, and also with the lip-letters *p* and *b*.

1. F in Latin corresponds to *h* in Spanish, as Latin *formoso*, beautiful; Spanish *hermoso;* Latin *femina*, female; Spanish *hembra;* Latin *fugere*, fly; Spanish *huir*. Other examples may readily be found in a Spanish Dictionary under the letter *h*. The same change prevailed between the Latin of Rome and the Sabine dialect of that language.

2. F in Latin corresponds to *th* in Greek, as Latin *fera*, a wild beast; Greek *θηρ*. Latin *fle*, weep; Greek *θρε*, as seen in *θρηνος*. Indeed this interchange prevailed among the dialects of the Greek language itself as in *ουφαρ* and *ουθαρ*; *φλαν* and *θλαν*; *φλιβω* and *θλιβω*. This however seems to depend on the proximity of the letters *l* and *r*. (See L.)

3. F in Latin corresponds to *b* in German and English, as *frang-ere*, brech-en, to break; *frater*, bruder, brother; *fago*, buche, beech, &c.

4. F in English and German to *p* in Latin, as *pelli*, fell, fell (comp. fellmonger); *ped*, fuss, foot; *pug-na-re*, fechten, to fight, &c.

F, in Music, is the fourth note, or degree, of the diatonic scale, answering to the *fa* of the Italians and French. It was originally used as the base clef, to which it gives a name; but while serving as a sign, time has gradually altered its form into that which as a clef it now takes. This letter is also an abbreviation of the Italian word *Forte*, strong, or loud. The double F signifies the superlative of *Forte*,—*Fortissimo*.

FABA'CEÆ. [LEGUMINOSÆ.]

FA'BIUS MA'XIMUS and the FABII FAMILY. The Fabii were a numerous and powerful gens or patrician house of antient Rome, which became subdivided into several families or branches distinguished by their respective cognomina, such as Fabii Maximi, Fabii Ambusti, Fabii Vibulani, &c. They were of Sabine origin, and settled on the Quirinal from the time of the earliest kings. After the expulsion of the Tarquinii, the Fabii as one of the older houses exercised considerable influence in the senate. Cæso Fabius being Quæstor with L. Valerius, impeached Spurius Cassius in the year of Rome 268, 486 B.C., and had him executed. It has been noted as a remarkable fact, that for seven consecutive years from that time, one of the two annual consulships was filled by three brothers Fabii in rotation. Niebuhr has particularly investigated this period of Roman history, and speculated on the causes of this long retention of office by the Fabii as connected with the struggle then pending between the patricians and the plebeians, and the attempt of the former to monopolize the elections. (*History of Rome*, vol. ii., *The Seven Consulships of the Fabii*.) One of the three brothers, Quintus Fabius Vibulanus, fell in battle against the Veientes, in the year 274 of Rome. In the following year, under the consulship of Cæso Fabius and Titus Virginius, the whole house of the Fabii proposed to leave Rome and settle on the borders of the territory of Veii, in order to take the war against the Veientes entirely into their hands. After performing solemn sacrifices, they left Rome in a body, mustering 306 patricians, besides their families, clients, and freedmen, and encamped on the banks of the Cremera in sight of Veii. There they forti ed themselves, and maintained for nearly two years a harassing warfare against the Veientes and other people of Etruria. At last in one of their predatory incursions they fell into an ambuscade, and fighting desperately, were all exterminated. (Livy, ii. 48. 50; and Niebuhr's *History, on the Veientine War*.) One only of the house, Quintus Fabius Vibulanus, who had remained at Rome, escaped, and became the parent stock of all the subsequent Fabii. He was repeatedly consul, and was afterwards one of the decemviri with Appius Claudius for two consecutive years, in which office he disgraced himself by his connivance at the oppressions of his colleague, which caused the fall of the decemvirate. In subsequent years we find several Fabii filling the consulship, until we come to M. Fabius Ambustus, who was consul in the year 393 of Rome, and again several times after. He fought against the Hernici and the Tarquinians, and left several sons, one of whom, known by the name of Quintus Fabius Maximus Rullianus, attacked and defeated the Samnites (429 of Rome) in the absence and against the orders of his commanding officer, the Dictator Papirius, who would have brought him to punishment for disobedience, but was prevented by the intercession of the soldiers and the people. This Fabius was five times consul, and dictator twice. He triumphed over the Samnites, Marsi, Gauls, and Tuscans. His son, Quintus Fabius Gurges, was thrice consul, and was the grandfather of QUINTUS FABIUS MAXIMUS VERRUCOSUS, one of the most celebrated generals of Rome. In his first consulate he triumphed over the Ligurians. After the Thrasymenian defeat he was named Prodictator by the unanimous voice of the people, and was intrusted with the salvation of the Republic. The system which he adopted to check the advance of Hannibal is well known. By a succession of skilful movements, marches, and counter-marches, always choosing good defensive positions, he harassed his antagonist, who could never draw him into ground favourable for his attack, while Fabius watched every opportunity of availing himself of any error or neglect on the part of the Carthaginians.

This mode of warfare, which was new to the Romans, acquired for Fabius the name of Cunctator, or 'temporizer,' and was censured by the young, the rash, and the ignorant; but it probably was the means of saving Rome from ruin. Minucius, who shared with Fabius the command of the army, having imprudently engaged Hannibal, was saved from total destruction by the timely assistance of the dictator. In the following year however, 536 of Rome, Fabius being recalled to Rome, the command of the army was intrusted to the consul T. Varro, who rushed imprudently to battle, when the defeat of Cannæ made manifest the wisdom of the dictator's previous caution. Fabius was made consul in the next year, and was again employed in keeping Hannibal in check. In 543 of Rome, being consul for the fifth time, he re-took Tarentum by stratagem, after which he narrowly escaped being caught himself in a snare by Hannibal near Metapontum. (Livy, xxvii. 15, 16.) When some years after the question was discussed in the senate of sending P. Scipio with an army into Africa, Fabius opposed it, saying that Italy ought first to be rid of Hannibal. Fabius died some time after at a very advanced age. His son, called likewise Quintus Fabius Maximus, who had also been consul, died before him. His grandson Quintus Fabius Maximus Servilianus, being proconsul, fought against Viriatus in Spain, and concluded with him an honourable peace. (Livy, *Epitome*, 54.) He was afterwards consul repeatedly, and also censor. He wrote Annals, which are quoted by Macrobius. (*Saturn.* i. 16.) His brother by adoption Quintus Fabius Maximus Æmilianus, the son of Paulus Æmilius (Livy, xlv. 41), was consul in 609 of Rome, and was the father of Fabius, called Allobrogicus, who subdued not only the Allobroges, but also the people of Southern Gaul, which he reduced into a Roman province, called from that time 'provincia,' or 'Gallia ulterior.' Quintus Fabius Maximus, a grandson of Fabius Maximus Servilianus, served in Spain under Julius Cæsar, and was made consul in the year 709 of Rome. Two of his sons or nephews, Paulus Fabius Maximus and Quintus Fabius Maximus were consuls in succession under Augustus. There was also a Fabius consul under Tiberius. Panvinius and others have reckoned that during a period of about five centuries, from the time of the first Fabius, who is mentioned as consul, to the reign of Tiberius, 48 consulships, 7 dictatorships, 8 censorships, 7 augurships, besides the offices of master of the horse and military tribune with consular power, were filled by individuals of the Fabian house. It also could boast of thirteen triumphs and two ovations. (Augustinus *de Familiis Romanorum*.)

FA'BIUS PICTOR, the historian, was descended from Marcus Fabius Ambustus, the consul. Caius Fabius, one of the sons of Ambustus, was called Pictor, because about B.C. 304 he painted the temple of the goddess of health, which painting existed till the reign of Claudius, when the temple was burnt. (Pliny, xxxv. c. 4.) The surname of Pictor was continued to his children, one of whom, Caius Fabius Pictor, was consul with Ogulnius Gallus B.C. 271, and was the father of the historian. Quintus Fabius Pictor, the historian, lived in the time of the second Punic war, according to the testimony of Livy (xxi.), who says, in speaking of the battle of the Thrasymene lake, that he followed in his narrative the authority of Fabius Pictor, who was contemporary with that memorable event. Fabius appears, from the testimony of Dionysius and Cicero, to have written both in Greek and in Latin. Of the extracts from or references to his 'Annals,' which have been transmitted to us, some concern the antiquities of Italy, and the beginning of Rome, others the subsequent fasti, or history of the Romans. He was the first who compiled a history of his country from the records of the pontiffs, and from popular tradition. He is spoken of with praise by Livy, who evidently borrowed largely from him, and by Cicero, Pliny, Appian, and others. Polybius however censures his obvious partiality for the Romans, and his unfairness towards the Carthaginians, in his account of the second Punic war. His Annals are lost, with the exception of some fragments, which have been preserved by subsequent writers, and are printed in the collections of Antonius Augustinus, Antwerp, 1595, Antonius Riccobonus, Venice, 1568, and others. The well-known impostor, Annio da Viterbo, published a small work on the origin of Rome, under the name of Fabius Pictor, but the fraud was discovered. Quintus Fabius Pictor was sent by the senate to Delphi after the battle of Cannæ, to consult the Oracle about the ultimate result of the war. He must not be confounded with Servius Fabius Pictor, who lived in the time of Cato the Elder, and who is praised by Cicero for his knowledge of jurisprudence, literature, and antiquity. (Vossius, *De Historicis Latinis*; Fabricius, *Bibliotheca Latina*.)

FABLE, Fábula in Latin, in its general sense means a fictitious narrative, but it also means more particularly a species of didactic composition, consisting of a short fictitious tale inculcating a moral truth or precept. As such it is divided into two sorts, the parable and the apologue. The former narrates some incident, which, although it may not have happened exactly as the narrator supposes, yet could have happened at any time, there being nothing impossible or improbable in it. Of this description are many of the parables contained in the Scriptures, and especially in the New Testament, it being a favourite mode with our Saviour of illustrating his precepts by similitudes. When, for instance, he spoke of the master who, before setting out on a long journey, intrusted certain talents or sums of money to each of his three servants, he did not mean that such a fact had occurred at any particular time, though it might have occurred, but he chose this figure as presenting the ways of God with regard to the mental or spiritual talents he has gifted men with, and which he expects them to cultivate and render useful in proportion to their capacities. The second species of moral fable, called apologue, relates facts which are evidently untrue, and cannot have happened; such as animals, or even inanimate things, speaking, but which serve as comparisons for the actions of men. Such was the well-known apologue of Menenius Agrippa, addressed to the plebs of Rome, who had revolted against the patricians, in which he told them of the various limbs of the human body having once revolted against the belly. (Livy, ii. 32.) Most of the fables which are called Æsopian are apologues, although some are of the parable kind; for example, that of Æsop and the villain who threw a stone at him. (Phædrus, iii. 5.)

The apologue is one of the oldest forms of composition, being well calculated to strike the minds of men in a rude state. Homer's War of the Mice and the Frogs is a composition of the nature of the apologue; only being extended to a considerable length, and including a succession of incidents, it is classed among the heroico-comic poems, whilst the apologue, or fable properly so called, points out only one particular incident from which it draws a moral. In the same manner, in modern times, the 'Animali Parlanti,' or 'Court and Parliament of Beasts' of Casti must be classed among the mock epic poems, although it may be said to consist of a series of apologues, each pointing to some particular error, or abuse, in the state of society, and in the conduct of men. It is probable that the older and simpler mythological fables of the gods and heroes among the antients were originally intended by the early patriarchs or priests to illustrate by allegory the attributes of the Creator, the phenomena of nature, and the progress of social life; but that in course of time people lost sight of the moral, and believed the fiction in its literal sense.

The oldest collection of fables in any European language is in Greek prose: the fables are attributed to Æsop, but much doubt exists as to the real author or authors of them. [ÆSOP.] Babrias wrote a metrical version of Æsopian fables, only a few of which have come down to us. [BABRIAS.] The fables called the fables of Bidpai [BIDPAI] are derived from a collection in the Sanscrit language, and Lokman is said to have written fables in Arabic; but several of the fables attributed to the latter appear to be the same as some of those attributed to Æsop, and it has been supposed that Lokman and Æsop were one and the same personage. [LOKMAN.]

Among the Latins, Phædrus, who lived under Tiberius, is the most celebrated: he professes to have taken his subjects from Æsop. The MS. of Phædrus was not discovered before the end of the sixteenth century. Avianus, or Avienus, who (supposing the two names to mean the same individual) lived under the elder Theodosius, wrote a collection of fables in Latin verse. (*Edition of Avienus*, Leyden, 1731, with a *Dissertation on the Identity of Avianus and Avienus*.) Faerno of Cremona, who lived about the middle of the sixteenth century, made a collection of Æsopian fables, which he turned into Latin verse, and which were published at Rome after his death in 1564. He was accused of plagiarism, as having found a MS. of Phædrus in some library, and borrowed his subjects from it.

In the modern languages, among the original writers of fables or apologues, La Fontaine has been generally considered as rivalling or surpassing Phædrus in this kind of composition; and indeed he may be fairly placed above all writers of this class. Among the English, Gay and Moore have written fables. The Germans have had Lessing, Gellert, and others; and the Spaniards have Yriarte and Samaniego. Among the Italians, Firenzuola, Crudeli, Baldi, Capaccio, in the sixteenth and seventeenth centuries, wrote chiefly translations or paraphrases from the Greek and Latin fabulists. In the eighteenth century Pignotti, a native of Tuscany, wrote original fables in verse, which were published at Pisa in 1782, and have been often reprinted since. Bertola also wrote fables (Pavia, 1788), with an essay on fables. Luigi Fiacchi published, under the name of 'Clasio,' a collection of fables (Florence, 1807).

FABRETTI, RAFFAELE, born at Urbino in 1619, was secretary of Pope Alexander VIII., and præfect of the papal archives in the castle St. Angelo under Innocent XII. Fabretti spent most of his time in searching the ruins which are scattered about Rome and its neighbourhood, and digging for those which were under ground. He explored catacombs, columbaria, sepulchres, and other subterraneous receptacles; and he gathered an abundant harvest of antiquities, and chiefly of inscriptions, which he ranged in a collection at his house at Urbino, which collection has been since transferred to the ducal palace of the same town. It is related that the horse upon which he rode for many years in his perambulations through the Campagna, and which his friends had nicknamed Marco Polo, became so accustomed to his master's hunting after inscriptions that he used to stop of himself whenever he met with any. Fabretti wrote, 1°, 'Inscriptionum Antiquarum Explicatio,' fol., 1699; 2°, 'De Columnâ Trajani,' fol., 1683, an elaborate work, in which he illustrated with much erudition and judgment the sculptures of that celebrated monument. He added to it an explanation of the Iliac table which is in the Capitoline Museum. 3°, 'De Aquis et Aquæductibus Veteris Romæ,' 4to., 1680, reprinted with notes and additions in 1788. Fabretti rendered great services to archæology by his system of illustrating one monument by the help of another. He had a controversy with James Gronovius about the interpretation of some passages of classical writers, in which both resorted to discreditable scurrilities. Fabretti died at Rome in January, 1700, at the age of eighty. He may be considered as the predecessor of Bianchini, Bottari, and other archæologists who illustrated the antiquities of Rome during the eighteenth century.

FABRIA'NO. [MACERATA.]

FABRI'CIUS, CAIUS, surnamed Luscinus, was consul for the first time in the year 471 of Rome, 283 B.C., when he triumphed over the Boii and the Etruscans. After the defeat of the Romans under the consul Lævinus by Pyrrhus (B.C. 281), Fabricius was sent by the senate as legate to the king to treat for the ransom of the prisoners, or, according to others, to propose terms of peace. Pyrrhus is said to have endeavoured to bribe him by large offers, which Fabricius, poor as he was, rejected with scorn, to the great admiration of the king. Fabricius being again consul (B.C. 279) was sent against Pyrrhus, who was then encamped near Tarentum. The physician to the king is said to have come secretly to the Roman camp, and to have proposed to Fabricius to poison his master for a bribe, at which the consul, indignant, had him put in fetters and sent back to Pyrrhus, upon whom this instance of Roman integrity made a great impression. Pyrrhus soon after sailed for Sicily, where he was called by the Syracusans, then hard pressed by the Carthaginians. Fabricius having defeated the Samnites, Lucanians, and Bruttii, who had joined Pyrrhus against Rome, triumphed over those people. Pyrrhus, afterwards returning to Italy, was finally defeated and driven away by M. Curius Dentatus (B.C. 276). Two years after, Fabricius being consul for the third time, with Claudius Cinna for his colleague, legates came from king Ptolemy of Egypt to contract an alliance with Rome. Several instances are related of the extreme frugality and simplicity of the manners of Fabricius, which are conformable to what is recorded of the austerity of Roman life previous to the Punic wars. When censor, he dismissed from the senate P. Cornelius Rufinus because he had in his possession ten pounds' weight of silver plate. Fabricius died poor, and the senate was obliged to make provision for his daughters. (Plutarch, *Life of Pyrrhus;* Livy, *Epitome* xiii., xiv., Eutropius; Justinus.)

FABRI'CIUS, JOANNES ALBERTUS, born at Leipzig in 1667, early distinguished himself by his proficiency in classical literature, and his penetration and judgment, assisted by an excellent memory. Having finished his studies at Leipzig, he went to Hamburg, where I. F. Meyer appointed him his librarian. He was afterwards appointed professor in the college of Hamburg, where he remained to the end of his life, having refused several advantageous offers made to him by the landgrave of Hesse Cassel and others. He was the author of many elaborate works, the principal of which are:—I. 'Bibliotheca Græca,' 14 vols. 4to., Hamburg, 1705-28. A new edition, with considerable improvements, was published by Harles, Hamburg, 1790-1809. The 'Bibliotheca Græca' is a most valuable work; it contains notices of all the Greek authors, from the oldest known down to those who flourished in the last period of the Byzantine empire, with lists of their works and remarks on them. II. 'Bibliotheca Latina,' 3 vols. 4to., 1708-21. Ernesti published a new and much improved edition of the same at Leipzig, 1773. The 'Bibliotheca Latina' is inferior in research and copiousness to the 'Bibliotheca Græca,' but is still a useful work, especially in the new form given to it by Ernesti. III. 'Bibliotheca Latina Ecclesiastica,' fol., Hamburg, 1718. IV. 'Bibliotheca Latina mediæ et infimæ Ætatis, cum Supplemento C. Schoettgenii, ex recensione Dominici Mansi,' Padua, 6 vols. 4to., 1754. V. 'Memoriæ Hamburgenses, 7 vols. 8vo.; to which Reimar, the son-in-law of Fabricius, added an eighth volume in 1745. VI. 'Codex Apocryphus Novi Testamenti,' 2 vols. 8vo., 1719; being a Collection of the false Gospels, Acts of the Apostles, and other apocryphal books which appeared in the early ages of Christianity. VII. 'Bibliographia Antiquaria,' 4to., 1760; being notices of the authors who have written upon Hebrew, Greek, Roman, and ecclesiastical antiquities. VIII. 'Delectus Argumentorum et Syllabus Scriptorum qui veritatem Religionis Christianæ lucubrationibus suis asseruerunt,' 4to., 1725. IX. 'Hydrotheologia,' written in German, and translated into French under the title 'Théologie de l'Eau, ou Essai sur la Bonté, la Sagesse, et la Puissance de Dieu, manifestées dans la Création de l'Eau,' 8vo., La Haye, 1741. X. 'Codex pseudepigraphus Veteris Testamenti,' being a counterpart of his work on the Apocrypha of the New Testament. XI. 'Conspectus Thesauri Litterarii Italiæ,' 8vo., 1749, or notices of the principal collections of the Historians of Italy, as well as of other writers who have illustrated the antiquities, geography, &c., of that country, including the great works of Burmannus and Grævius, with an account of the Italian literary journals existing or which had existed before the time of Fabricius, of the Italian academies, and a catalogue of Italian bibliographers and biographers classed according to the particular towns which they have illustrated. XII. 'Imp. Cæs. Augusti Temporum Notatio, Genus et Scriptorum Fragmenta,' with 'Nicolai Damasceni De Institutione Augusti,' 4to., 1727. XIII. 'Salutaris Lux Evangelii, sive Notitia Propagatorum per Orbem totum Sacrorum: accedunt Epistolæ quædam ineditæ Juliani Imperatoris, Gregorii Habessini Theologia Æthiopica, necnon Index geographicus Episcopatuum Orbis Christiani,' 4to., 1731; a work which contains useful information for students of ecclesiastical history. XIV. 'Centifolium Lutheranum, sive Notitia Literaria Scriptorum omnis generis de Martino Luthero, ejus Vita, Scriptis, et Reformatione Ecclesiæ editorum,' two vols. 8vo. 1730. XV. 'Centuria Fabriciorum Scriptis clarorum qui jam diem suam obierunt collecta,' 8vo., 1709, with a continuation in 1727. The author has included in his list not only the authors whose name or sirname was Fabricius, but also those whose names may be turned into the Latin Fabricius; such as Le Fevre, Fabri, the German Schmidts, &c. Independently of the above and other minor works, Fabricius published editions of Sextus Empiricus, of the Gallia Orientalis of Father Colomiès, of the works of St. Hippolytus, and many others. The catalogue of the works published by him exceeds 100. Fabricius died at Hamburg in April, 1736, in his 69th year. His private character was as praiseworthy as his learning was great. He was modest, hospitable to strangers who came to visit him, indefatigable in the duties of his professorship and rectorship, and yet he found time for the compilation of the numerous works already mentioned. Reimar, his son-in-law, wrote his biography in Latin, 8vo. 1732.

FABRI'CIUS, JOHANN CHRIST, was born in the year 1742, at Tundern, in the duchy of Sleswick. He was brought up to the medical profession, and at the age of twenty-three was made professor of natural history and rural economy at Kiel.

Fabricius studied under Linnæus, and afterwards enjoyed perhaps a more brilliant reputation than any other pupil of that great naturalist. Having been filled with emulation by the circumstance of Linnæus quoting him in his 'Systema Naturæ,' he resolved to make an especial study of entomology, a science at that time in its infancy. The first results of his investigations were shortly after (1775) made known in his 'Systema Entomologiæ,' where he proposed a new arrangement of the insect tribe, the novelty of which consisted in choosing for his divisions the modifications observable in the parts of the mouth. The two methods previously adopted were founded, the one upon the metamorphoses of the various tribes, the other upon their organs of motion. The latter was first pointed out by Aristotle, and was that adopted by Linnæus.

Fabricius subsequently published numerous other works of still greater importance, a list of which is given at the end of this article. Possessing a great knowledge of languages, Fabricius travelled through the northern and middle states of Europe, collecting new materials, and frequenting the various museums, from which he described all such insects as had hitherto been unpublished. Accounts of his travels in Norway, Russia, and England, were published by him. He visited England seven times, and received great assistance from inspecting the collections of Sir Joseph Banks*, John Hunter, Drury, Francillon, and others.

Far from being jealous of those naturalists who, in his day, enjoyed reputation in the same branches which he more particularly attended to, Fabricius, upon seeing the beautiful work of Walckenaer on spiders, expressed great delight; and although no request had been made, he hastened to convey to that author all the specimens which he possessed of the spider tribe. Fabricius was of an amiable disposition; and is said to have been reproached by a fellow professor for his extreme modesty, which his friend urged would retard his advancement. Although so well versed in entomology, Fabricius was not a stranger to other branches of zoology; he was also versed in botany and mineralogy. He died of dropsy, in his sixty-fifth year,

* Numerous insects in the collection of Sir Joseph Banks (which is now the property of the Linnæan Society) still have names attached to them in the handwriting of Fabricius.

much regretted by all naturalists. His principal works are as follows:—

1, 'Systema Entomologiæ, sistens Insectorum Classes,' &c., 1 vol., 8vo., Flensburgi et Lipsiæ, 1775; 2, 'Philosophia Entomologica,' 8vo., Hamburgi et Kilonii, 1778; 3, 'Reise nach Norwegen, mit Bemerkungen aus der Natur Historie und Œconomie,' 8vo., Hamburg, 1779; 4, 'Species Insectorum, sistens eorum differentias specificas, synonymia auctorum, loca natalia, metamorphosis,' &c., 2 vols., 8vo., Hamburg et Kilonii, 1781; 5, 'Mantissa Insectorum; sistens species nuper detectas,' &c., 2 vols., 8vo., Hafniæ, 1787; 6, 'Genera Insectorum,' 1 vol., 8vo. (Chilonii), Kiel, 1776; 7, 'Entomologia Systematica, emendata et aucta,' 4 vols., 8vo., Hafniæ, 1792, 93, 94; 8, 'Index Alphabeticus,' 1796; 9, 'Supplementum Entomologiæ Systematicæ,' 1 vol., 8vo., Hafniæ, 1798; 10, 'Systema *Eleuteratorum*,' 2 vols., 8vo., Kiliæ, 1801; 11, 'Index,' 8vo., Kiliæ, 1802; 12, 'Systema *Rhyngotorum*,' 8vo., Brunsvigæ, 1801; 13, 'Index Alphabeticus Rhyngotorum, genera et species continens,' 4to., Brunswick, 1803; 14, 'Systema *Piezatorum*,' 8vo., Brunsvigæ, 1804; 15, 'Systema *Antliatorum*,' 8vo., Brunsvigæ, 1805.

FABRI'ZIO, GERO'NIMO, commonly called **FABRICIUS AB AQUAPENDENTE**, was born in 1537 at Acquapendente in Italy, a city near Orvieto, in the States of the Church. His parents, although poor, contrived to furnish him with the means of obtaining an excellent education at Padua, which was then rapidly approaching the eminence it long held, especially as a school of medicine, among the universities of Europe. It appears to have been a favourite object with the Venetian government to encourage the study of the medical sciences. Vesalius and Fallopius had been successively invited to fill the chair of anatomy and surgery, then conjoined, and reaped a rich harvest of public emolument and honour; and Fabricius himself, who did much to extend the reputation of the school formed by these leaders in the restoration of anatomy, was afterwards still more munificently rewarded, though equal to neither in merit or posthumous fame. He became a pupil of Fallopius at an early age, and speedily attracted the attention and good-will of his instructor. He thus secured many peculiar advantages, of which he availed himself so well, that having taken his degrees in medicine with much credit, he was appointed on the death of Fallopius in 1562 to succeed him in the direction of the anatomical studies of the university, and three years later to the full emoluments of the professorship. The growing perception of the importance of anatomical knowledge led, in 1584, to the institution of a separate chair for the teaching of that branch of medicine, which, however, Fabricius appears to have still held in conjunction with that of surgery up to a late period of his life, with the able assistance of Casserius.

His reputation as a teacher drew students from all parts of Europe; till at length the theatre of anatomy, built originally by himself, became so crowded, that the Venetian senate provided him, in 1593, with another of ample dimensions at the public expense; and at the same time added largely to his salary, and granted him many exclusive privileges and titles of honour. The fame and wealth he derived from his practice as a surgeon was even more than equal to that which he enjoyed as an anatomist; and after upwards of fifty years of uninterrupted and well-deserved prosperity, he retired from public life the possessor of an enormous fortune and the object of universal esteem. Yet he does not appear to have found the contentment he sought in his retirement. His latter years were embittered by domestic dissensions and the unfeeling conduct of those who expected to become his heirs; and he died in 1619, at the age of eighty-two, not without the suspicion of poison, at his country-seat on the banks of the Brenta, still known as the Montagnuola d'Acquapendente.

The name of Fabricius is endeared to the cultivators of his science by the circumstance of his having been the tutor of William Harvey, whose discovery of the circulation of the blood (by far the most important yet achieved in physiology) was suggested, according to his own statement, by the remarks of Fabricius on the valvular structure of the veins. The title of Fabricius to the minor discovery has been disputed, though strongly asserted by some anatomists. The truth is, that his merit did not so much consist in original discovery as in the systematic arrangement and dissemination of the knowledge acquired by his predecessors. We have mentioned that he had more contemporary reputation as a practical surgeon than as an anatomist; and it is as a surgeon that he is still chiefly remembered. The observations recorded in his works having, however, been since wrought up in the general body of surgical knowledge, are now seldom consulted or quoted specifically as derived from himself.

He published many tracts on both departments. Those on anatomy and physiology, often referred to, but not with unmixed praise, by Harvey and the writers of the period immediately subsequent to his own, were collected in one volume folio, and republished, with a biographical memoir of the author, by Albinus at Leyden in 1738. The best edition of his surgical works, the twenty-fifth, was printed, also in one folio volume, at Padua in 1666. His writings are all in Latin, and display a considerable knowledge of the literature, general and medical, of that language and of the Greek.

FABYAN, ROBERT, the historian, was descended of a respectable family of Essex. Bishop Tanner says he was born in London. We have no dates of his early life, but he is known to have belonged, as a citizen, to the Company of Drapers. From records in the city archives, it appears that he was alderman of the ward of Farringdon Without, and in 1493 served the office of sheriff. In 1496, in the mayoralty of Sir Henry Colet, we find him 'assigned and chosen,' with Mr. Recorder and certain commoners, to ride to the king 'for redress of the new impositions raised and levied upon English cloths in the archduke's land,' (that is, the Low Countries) an exaction which was desisted from in the following year. In 1502, on the plea of poverty, he resigned the alderman's gown, not willing to take the mayoralty, and probably retired to the mansion in Essex, mentioned in his will, at Theydon Gernon. That he was opulent at this period cannot be doubted, but he seems to have considered that the expenses of the chief magistracy, even at that time, were too great to be sustained by a man who had a numerous family. He ordered the figures, as may be seen in his will, of sixteen children, in brass, to be placed upon his monument. Stowe, in his 'Survey of London' (edit. 1603, p. 198), gives the English part of the epitaph on Fabyan's tomb, from the church of St. Michael Cornhill, and says he died in 1511, adding that his monument was gone. Bale, who places Fabyan's death on February 28th, 1512, is probably nearest to the truth, as his will, though dated July 11, 1511, was not proved till July 12, 1513. Fabyan's will, printed with the last edition of his 'Chronicle,' affords a curious comment on the manners of the time of Henry VIII.

There have been printed five editions of Fabyan's 'Chronicle.' The first was printed by Pynson in 1516, and is of great rarity, in a perfect state. Bale says that Wolsey ordered many copies of it ('exemplaria nonnulla') to be burnt. The second was printed by Rastell in 1533. The third in 1542, by Reynes. The fourth in 1559, by Kyngeston. The changes of religion gave rise to many alterations and omissions in the third and fourth editions; but all the editions, as well as a manuscript of the second part of the book, were collated by Sir H. Ellis for the fifth edition, 4to., London, 1811, from the preface to which the present account of the historian has been principally taken. Fabyan, whose object it was to reconcile the discordant testimonies of historians, named his book 'The Concordance of Histories,' adding the fruits of personal observation in the latter part of his Chronicle. The first edition had no regular title; the latest is called 'The New Chronicles of England and France, in two parts, by Robert Fabyan, named by himself the Concordance of Histories.' The first edition, which may be considered as Fabyan's genuine work, extends from the time when 'Brute entryd firste the Ile of Albion,' to 1485; the second continued the history to 1509; the third to 1541; and the fourth to the month of May, 1559. The names of the several authors who were the continuators are unknown.

FAÇADE, a French term of modern introduction into the English language. It expresses the face, or front view of an edifice, and is often used in speaking of architectural buildings, as the façade of the Louvre, or the façade of St. Peter's at Rome. Façade was applied originally to denote the principal front of a building: the term Facciata, used by the Italians, is, for the most part, applied to such fronts as have a principal entrance.

FACCIOLA'TI, JA'COPO, was born at Toriggia on the

Euganean hills, in the province of Padua, in 1682. He studied first in the college of Este, and was afterwards placed by Cardinal Barbarigo, bishop of Padua, in the clerical seminary of that city, where he completed his studies and was admitted into holy orders. He was then appointed teacher and afterwards præfect or chief superior of the same establishment. The seminary of Padua had and still has a high reputation as a place for the study of Latin and for the numerous and generally accurate editions of the classics and other school books which have come from its press. Facciolati contributed to support this reputation by his labours. Among other works, he published improved editions of the Lexicon of Schrevelius, of the Thesaurus Ciceronianus of Nizolius, and of the vocabulary of seven languages known by the name of 'Calepino,' 2 vols. fol., 1731. In this last undertaking he was greatly assisted by his pupil, Egidio Forcellini, although he was not willing to acknowledge the obligation. The work however being still incomplete, J. B. Gallizioli made a new edition of the 'Calepino,' 2 vols. fol., Venice, 1778, and added many oriental and other words. It was in the course of his joint labours with Facciolati that Forcellini conceived the plan of a totally new Latin Dictionary, which, after more than 30 years' assiduous application, he brought to light under the title of 'Totius Latinitatis Lexicon,' 4 vols. fol., Padua, 1771. This work has superseded all other Latin Dictionaries. Forcellini, more generous than Facciolati, acknowledged in the title-page of his work that its production was in great measure due to the advice and instruction of his deceased master. In the introductory address to the pupils of the seminary of Padua, he tells them with a touching simplicity that when he undertook his work he was in the prime of youth, but that in the course of its compilation he had grown old and infirm as they then beheld him. The MS. of his 'Lexicon,' in 12 vols. fol., is preserved in the library of the seminary. A new edition of Forcellini's Lexicon has been lately published by the Abate Furlanetto of the same institution.

In 1722, Facciolati being appointed professor of logic in the university of Padua, delivered a series of introductory Latin discourses to the students of his class, which were received with considerable applause. In 1739 he began to write in Latin the 'Fasti of the University of Padua:' the introductory part, in which he describes the origin, the laws and regulations, and the object of that celebrated institution, is very well written, but the Fasti themselves contain little more than dry lists of the successive professors with few and unimportant remarks. His Latin epistles, as well as his Orations or discourses, have been admired for the purity of their diction. Indeed Facciolati's latinity was much praised by competent judges, such as Roberti and others of his countrymen, as well as by Brucker, the historian of philosophy, and other learned foreigners. The king of Portugal sent him a flattering invitation to Lisbon to take the direction of the public studies in his kingdom, but Facciolati declined the offer on account of his advanced age. He however wrote instructions for the re-organization of the scholastic establishments of that country, which had become necessary after the expulsion of the Jesuits. Facciolati died at Padua in 1769, in his 88th year. He left numerous works, mostly in Latin, besides those already mentioned; among others, some allegorical and satirical dialogues on the occasion of a funeral oration which he had written for the late Doge Pisani, being suppressed by the Padua Riformatori, or Censors.

FACIA. [CIVIL ARCHITECTURE; COLUMN.]

FACTOR, a name given to any algebraical expression considered as part of a product. Thus, a and $a+x$ are the factors of the product $a(a+x)$, or a^2+ax.

The term *factorial expression* has been in some instances applied to an expression of which the factors are in arithmetical progression; such as—

$$(x+1)(x+2)(x+3)(x+4).$$

See Herschel, *Examples of the Calculus of Finite Differences.*

FACTOR is a mercantile agent, who buys and sells the goods of others, and transacts their ordinary business on commission. He is entrusted with the possession, management, and disposal of the goods, and buys and sells in his own name, in which particulars consists the main difference between factors and brokers. [BROKER.]

The chief part of the foreign trade of every country is carried on through the medium of factors, who generally reside in a foreign country, or in a mercantile town at a distance from the merchants or manufacturers who employ them; and they differ from mere agents in being entrusted with a general authority to transact the affairs of their employers. The common duty of a factor is to receive consignments of goods and make sales and remittances either in money, bills, or purchased goods in return; and he is paid by means of a per-centage or commission upon the money passing through his hands. It is usual for a factor to make advances upon the goods consigned to him, for which, and also for his commission, he has a general lien upon all the property of his employer which may at any time be in his hands.

It is the duty of a factor to keep the goods with which he is entrusted free from injury, to keep a clear account of his dealings in the affairs of his employer, and at proper times to transmit it to him, together with information of all the transactions and liabilities which he has entered into and incurred in the course of his employment, and by which his principal can be affected; also to send him advice of all bills accepted or drawn upon his credit, and generally to act with fidelity to him, strictly observing the letter or the spirit of his instructions, and where they are silent, following the ordinary prudent course of other merchants dealing in like commodities as to time and mode of sale, credit, &c. A factor is not answerable against all events for the safety of the goods in his care: it is sufficient if he does all that a man of average prudence would do in the care of his own goods. He is not answerable in cases of robbery, fire, or other accidental damage happening without his default He is bound, upon receiving notice from his principal, to insure the goods consigned to him (provided he has effects of his principal in his hands of sufficient amount to defray the premium), to discharge the duties payable upon the exportation or importation of the goods, or to cause the regular and necessary entries to be made at the custom-house, and do all other things necessary for the safety and preservation of the goods. His liability in this respect is ably explained by Sir William Jones in his *Treatise on Bailments;* and see BAILMENTS, fifth division, 'Locatum,' second subdivision.

Where general and unlimited orders are given to a factor, he is left to buy and sell on the best conditions he can, and if detriment arise to the principal, he has no redress, unless he can show that the factor acted fraudulently or with gross negligence.

In accordance with the general rule that a principal can only be bound by the acts of his agent while acting within the scope of his authority, it was held, previously to the passing of the recent stat. 6 George IV., c. 94, that a factor had only authority to sell the goods of his principal, and that if he pledged them, the principal might recover them from the pledgee. This was productive of considerable hardship in many cases; for, besides that by the mercantile law of every other country except England and America, the pledgee might retain the goods as security for his advances to the factor, it was urged, and with great reason, that, as between the principal and the pledgee of the factor, the principal ought to bear the loss. He it was who placed confidence in the factor, and who enabled him to appear the actual owner of the goods: he might have controlled the authority and limited the operations of his factor; but the pledgee knew nothing of his employment; he saw only the factor in the possession of the goods, and advanced his money on what appeared a sufficient security for repayment. In accordance with views like these, that statute was passed, and now the pledgee of a factor, when he lends his money without notice that the factor is not the actual owner of the goods. is enabled to retain them for his security; and even when he has such notice, the lender has a lien upon the goods to the same amount as the factor was entitled to.

A sale by a factor creates a contract between the principal and the buyer, and the principal may maintain an action against the buyer for the price, and may by notice direct him not to pay the money to the factor, which notice the buyer is bound to attend to. So a purchase by a factor for his principal renders the latter liable to the vendor, though a payment to the factor is a sufficient discharge, unless notice to the contrary has been given by the principal. And this holds good in both cases, even when the

name of the principal is not disclosed at the time of the contract, but is afterwards discovered; though, where a factor conceals the name of his principal and buys or sells apparently on his own account, the buyer or seller may treat the factor as the principal so far as any other liability of the factor may exist to him; as where a factor sells goods in his own name, being indebted to the purchaser, the latter may set off the amount of debt due to him from the factor against the price of the goods.

There is another description of factor, who acts under what is called a del credere commission, where, for an additional per-centage he engages for the solvency of the purchasers of the goods consigned to him. This contract, it is evident, arises on the supposition that the factor being resident among the purchasers, must be better able to judge of their solvency than the principal, residing in a foreign country. For a long time it was considered that under this arrangement those who dealt with the factor were liable to him alone, and that he was liable, in the first instance, to his employer; it has, however, been decided that the factor stands in the relation of a surety for the persons with whom he deals on account of the employer, and that he is liable to his employer only in case of their default. Del credere is an Italian mercantile phrase, of the same signification as the English word guarantee, and the Scotch warrandice.

When goods are consigned to joint factors they are answerable for one another for the whole, and by the law of merchants, as factors, are oftentimes dispersed, one may account without his companion.

The principal may recover against his factor by action for the neglect of his duty, or disobedience to his instructions if loss occur thereby, as if he purchases goods at a limited price, and fraudulently sells them again for his own profit. If a factor, without the orders of his principal, exports goods prohibited by the Customs' laws, and the same are seized, the loss is the factor's; and so, if he pay money without the direction of his employer, or sells his goods at an undervalue, or exports goods of an improper quality, he is answerable for the damage. And if a factor exports goods of a different quality or kind from those he was directed to purchase, or sends them to a place other than that to which he was ordered to send them, the merchant may refuse to accept them, and may recover any damage he has sustained, in consequence of his neglect, from the factor. The rights and liabilities of merchants and factors are governed by the laws of the place in which they are domiciled, and any contract which may be made by either of them must be governed by the law of the place where it is made, and these rules are acted upon by the courts of justice of every civilized nation. Thus, since the passing of the above-mentioned statute, a foreign merchant cannot recover his goods from the pledgee of his factor in England, though he may be totally ignorant of the change which has taken place in the law. And again, if a bill be accepted in Leghorn by an Englishman, and the drawer fails, and the acceptor has not sufficient effects of the drawer in his hands at the time of acceptance, the acceptance becomes void by the law of Leghorn, and the acceptor is discharged from all liability, though by the law of England he would be bound. (See 2 Strange's *Reports*, 733; Beawe's *Lex Merc.*; Bell's *Commentaries*; Paley, *Principal and Agent*; M'Culloch's *Commercial Dict.*)

FACTORY. FACTORY SYSTEM. The name of factory was formerly given only to establishments of merchants and factors resident in foreign countries, who were governed by certain regulations adopted for their mutual support and assistance against the undue encroachments or interference of the governments of the countries in which they resided. In modern times these factories have, in a great measure, ceased to exist, because of the greater degree of security which merchants feel as regards both the justice of those governments and the protection, when needed, of their own country. In its usual acceptation, the word factory is now employed to denote an establishment in which a considerable number of workmen or artizans are employed together for the production of some article of manufacture, most commonly with the assistance of machinery. The factory-system of England owes its origin to the invention and skill of Arkwright. It is true the name of factory is equally applied to various establishments for the operations of which those inventions are inapplicable, but it is probable that but for the invention of spinning-machinery, and the consequent necessary aggregation of large numbers of workmen in cotton-mills, the name would never have been thus applied. It is in these cotton-mills that the factory system has been brought to its highest state of perfection, and it cannot therefore be necessary to extend our description to the operations of any other branch of manufacture.

The first cotton-factory was established by Arkwright in connection with Messrs. Need and Strutt, of Derby, and was situated at Cromford, on the river Derwent. It was built in 1771, and continues still in operation, with the original spinning-frames of the great inventor. It is not the least among the merits of that extraordinary man, that being the first to employ the combined labour of numerous workmen for the production of that which had previously resulted from individual employment, he was able to arrange and establish the details of the processes with so great a regard to order, economy, and simplicity of action, that with but few and unimportant modifications, his plans are continued to the present day. [ARKWRIGHT.] The operations of Arkwright and his partners were for many years met by a spirit of opposition on the part of other manufacturers, who foresaw that the success of the new machinery would speedily destroy the value of the hand-spinning implements which they employed. Their combinations to destroy his patent rights have already been described. Taking advantage of the prejudices of the workmen, they had no difficulty in producing the belief that the new machines would soon entirely supersede manual labour, and the consequence of this delusion was a general crusade of the workmen against all spinning-machinery set in motion by horse or water-power. The principal effect of the riots thus occasioned was the removal of establishments to other and more peaceable parts of the country. For a considerable time Arkwright and his partners had an interest in the greater part of the cotton factories that were erected. The first of these establishments brought to use in Manchester was built in 1780, and had its machinery impelled by an hydraulic wheel, the water for which was furnished by a single-stroke atmospheric pumping steam-engine. The progress of these new establishments was so rapid that in 1787 there were 145 cotton-spinning factories in England and Wales, containing nearly two millions of spindles, and estimated to produce as much yarn as could have been spun by a million of persons using the old domestic wheel.

A return called for by the House of Commons in the last session states the number of factories which, in the month of February, 1837, were under the regulations imposed by the 'Factory Act.' From this return, it appears that the establishments at that time subject to the visits of the parliamentary inspectors amounted to 4160, showing an increase of 1000 factories upon the numbers given above. This great increase may be owing in part to the circumstance of some establishments existing in 1835 having since been brought under the regulations. The return does not apportion the different manufactures to which those 4160 establishments are applied. In a report made by Dr. Kay, one of the assistant Poor Law Commissioners, in July, 1835, it is stated that in the cotton manufacturing districts of Lancashire and their immediate vicinity steam power equivalent to 7507 horses was then either erected or in the course of being erected, but the establishments for the use of which that additional machinery was destined were not yet supplied with hands. At the ordinary ascertained rate this amount of mechanical power would call for the employment of 45,042 hands, exclusive of mechanics, labourers, handicraftsmen, and others employed out of the factories. The activity that up to the close of 1836 was experienced in this branch of national industry must have occasioned even a still greater extension than is mentioned by Dr. Kay, and we shall probably be within the mark if we estimate the number of hands employed in cotton factories in the autumn of 1836 at considerably more than 300,000. The check to commercial operations then experienced has probably prevented any fresh extension of the manufacture, but at this time (October, 1837) the cotton factories throughout the kingdom are in full operation in order to answer the demand for goods in almost every market in the civilized world.

The number of cotton, wool, silk, and flax-spinning factories worked by steam or water-power in the United Kingdom, with the number and ages of persons employed therein in the year 1835, was stated in the Statistical Tables published by the Board of Trade to be as follows:—

DIVISIONS OF THE KINGDOM.	Number of Factories.		NUMBER AND AGES OF PERSONS EMPLOYED.

It will be seen from the foregoing table, that a very large proportion of the hands employed in factories consist of children and young persons. The large sums invested in machinery make it a matter of great importance to the owners to keep their works in motion as constantly as possible, and, unless prevented by legislative interference, there is too much reason to believe that children may be tasked beyond their strength, to the permanent injury of their constitutions. This abuse was the more to be apprehended, because a large proportion of the children engaged in cotton-spinning are not directly employed by the masters, but are under the control of the spinners, a highly-paid class of workmen, whose earnings depend greatly upon the length of time during which they can keep their young assistants at work. Although the recitals of cruelties alleged to exist were shown upon investigation to have been very greatly exaggerated, it cannot be denied that enough of misery was produced to render it imperative upon the legislature to interfere. A parliamentary committee sat for the investigation of this subject in 1832, and subsequently a commission was issued by the crown for ascertaining, by examinations at the factories themselves, the kind and degree of abuses that prevailed, and for suggesting the proper remedies. In consequence of these inquiries an act was passed in 1833, (2 and 3 Wm. IV., c. 103,) the provisions of which, it is generally believed, have effected all the good which it is in the power of the legislature to do, consistently with the prosecution of the branches of industry to which the provisions of the act apply: the principal of those provisions are as follows:—

After the 1st January, 1834, no person under the age of 18 years is allowed to work in any cotton, woollen, flax, or silk factory worked by the aid of steam or water-power, between the hours of half-past eight in the evening and half-past five in the morning.

No person under 18 years of age is allowed to work more than 12 hours in any one day, nor more than 69 hours in the week. In factories worked by the aid of water-power, time lost through the deficiency of water may be made up at the rate of three hours additional labour in the week. In factories where the steam-engine is employed, lost time occurring through any accident happening to the machinery may be made up at the rate of one hour per day. One hour and a half to be allowed in each day for meals.

Except in silk-mills, no children under nine years of age are allowed to be employed.

Children under 11 years old are not to be worked more than nine hours in any one day, nor more than 48 hours in one week. This clause came into operation six months after the passing of the act. At the expiration of another 12 months its restriction was applied to children under 12 years old, and when 30 months from the passing of the act had elapsed the restriction was applied to all children under 13 years old. As the act was passed on the 30th August, 1833, this clause came fully into operation on the 1st of March, 1836. In silk-mills, children under 13 years of age are allowed to work 10 hours per day. The children whose hours of work are regulated by the act are entitled as holidays to the whole day on Christmas-day and Good-Friday, and besides to eight half days in the year. It is made illegal for any mill-owner to have in his employ any child who has not completed 11 years of age without a certificate by a surgeon or physician, 'that such child is of the ordinary strength and appearance of children of or exceeding the age of nine years.' In 18 months from the passing of the act this provision was made to apply to all children under 12 years of age, and upon the first March, 1836, the provision was made to include all children under the age of 13. Four persons were appointed under the act to be Inspectors of Factories, in order to carry into effect the various provisions which it contains, with power to make such rules and orders for the purpose as they should see necessary; and in order to assist the inspectors in the performance of their duties, an adequate number of superintendents were appointed to act under their directions.

After the expiration of six months from the passing of the act, it was declared unlawful to employ in any factory any child under the ages restricted to forty-eight hours' labour in the week, unless on every Monday the employer should receive a ticket from some schoolmaster, certifying that such child has 'for two hours at least for six out of seven days of the week next preceding attended his school. The school to be chosen by the parents or guardians of the child; but in case of their omitting to appoint any school, or in case of the child being without parent or guardian, the inspector may appoint some school in which the child may be taught, and the employer may be allowed to deduct from its weekly earnings any sum not exceeding one penny in every shilling, to pay for the schooling of such child.'

The full and perfect carrying out of the intention of the legislature in passing this act is provided for as far as possible by various penalties, which it is not necessary further

to particularise. One half of the penalties are, as is usual, awarded to the informers, and the remainder is to be applied towards the support of schools in which children employed in factories are educated.

The faithful discharge of their duties on the part of the inspectors is provided for, by requiring them twice in every year, and oftener, if called upon, to deliver in a report to the secretary of state, detailing the condition of the factories, and of the children employed therein.

FACULTIES. [UNIVERSITY.]

FÆ'CULA. [STARCH.]

FAE'NZA (formerly Faventia), a town and bishop's see of the papal state north of the Apennines, in the delegazione or province of Ravenna. It is situated in a well-cultivated plain watered by the river Lamone, which rises in the Apennines of Tuscany and runs to the Adriatic. A naviglio or navigable canal communicates between Faenza and the Po di Primaro, or southernmost branch of the Po. Faenza is a well-built, modern-looking town, with about 15,000 inhabitants. The streets are regular; there is a fine market-place surrounded by arcades, many palaces, churches rich in paintings, convents, a fine bridge on the Lamone, a theatre, and a Lyceum. There are several manufactories of a kind of coloured and glazed earthenware, which is called Majolica in Italy, and Faience in France, where it was introduced from Faenza, and which, before the manufacture of china or porcelain became established in Europe, was in greater repute than it is at present. There are also manufactories for spinning and weaving silk, and some paper-mills. Faventia was antiently a town of the Boii, and afterwards a municipium under the Romans. It was near Faventia that Sulla defeated the consul Carbo and drove him out of Italy. (Livy, *Epitome*, 88.) It was afterwards ruined by the Goths, was restored under the Exarchs, but its walls were not raised until A.D. 1286. It was then for some time subject to the Bolognese, but was afterwards ruled by the house of Manfredi to the end of the fifteenth century. Galeotto Manfredi being murdered by his wife left two infant sons, Astorre and Evangelista, the elder of whom, a remarkably handsome youth, was proclaimed by the inhabitants lord of Faenza; but a few years after, Cesare Borgia, as captain-general of his father, Pope Alexander VI., besieged the town, and the inhabitants surrendered on condition that Astorre and his brother should be free. He however sent them prisoners to Rome, where they were cruelly put to death in the Castle Sant' Angelo, and their bodies thrown into the Tiber, in the year 1501. This was one of the most atrocious transactions in the life of Borgia. Since that time Faenza has been annexed to the papal state. Faenza lies on the Via Æmilia, 30 miles south-east of Bologna, 40 north-west of Rimini, and 20 south-west of Ravenna. In the Roman times, a road led from Faventia to the south, which ascending the valley of the Anemo, now Lamone, and crossing the ridge of the Apennines, descended to Fæsulæ. By this road some have supposed that Hannibal crossed the Apennines into Etruria. A new carriage-road in a parallel direction, but more to the eastward, has been completed by the present grand-duke of Tuscany: it leads from Dicomano, in the valley of the Sieve, north of Florence, crosses the Apennines of San Benedetto, 5000 feet above the sea, and then following the course of the river Montone, joins the Via Æmilia near Forli.

FA'GUS, the beech, is a genus of Corylaceous exogens, having triangular nuts enclosed within a spiny capsule or husk. There are several species, some of which are mere bushes; the only one known in Europe of any importance is the *Fagus sylvatica*, or common beech, a native of various parts of the world in temperate climates. In Europe it is found as far north as 58° in Norway: it is met with in Palestine and Armenia, all over the south of Europe, and in the United States of America. It is one of the most handsome of our trees on dry sandy or chalky situations; its mast or nuts not only furnish food for swine, but yield by pressure after pounding a useful oil; and its timber, although not of good quality where strength and durability are required, is very extensively used for a variety of purposes, particularly for boat-building, work under water, carving and chair-making; it is also one of the best kinds of wood for fuel. Several varieties are propagated by the nurserymen, the *purple* and the *fern-leaved* being beautiful, and the *crested* very much the contrary. (See Loudon's *Arboretum and Fruticetum Britannicum*, p. 1949, for a copious account of this tree.)

The common beech is multiplied by sowing its mast; the varieties by grafting upon the wild sort. To effect this successfully, it is necessary that the scions should be of at least two years' old wood, and the grafts must be clayed first and then earthed up. If one year old wood is used the scions rarely take.

There is no doubt that the beech is the plant called Fagus by Virgil; but the Fegus (φηγός) of Theophrastus seems to have been some sort of oak with sweet acorns, and is by most botanical commentators referred to the Quercus Esculus of Linnæus.

FAHLORE, *Fahlerz*, grey copper ore. Of this there are two varieties, the *arsenical* and the *antimonial;* the former occurs crystallized and massive; the primary form of the crystal is a cube, but the regular tetrahedron is the predominating crystal. Colour steel-grey. Opaque. Lustre metallic. Sp. gr. 4·8, 5·1. Hardness 3·0,4·0. Brittle. Cleavage parallel to the planes of the tetrahedron, very indistinct. Fracture conchoidal.

Massive Variety.—Amorphous. Structure, granular to compact.

It occurs in Cornwall, Hungary, Saxony, &c. A specimen from Freiberg, analyzed by Klaproth, yielded—

Arsenic	24·10
Copper	41·
Iron	22·50
Sulphur	10·
Silver	·40
Loss	2·
	100·

It frequently contains a much larger quantity of silver, and not uncommonly zinc.

Antimonical Fahlore.—Occurs crystallized in modified tetrahedrons. Colour dark lead-grey, approaching to iron black, both externally and internally; not very brittle.

Analysis of a specimen from Kapnic by Klaproth:—

Antimony	22·
Copper	37·75
Iron	3·25
Sulphur	28·
Silver and a trace of manganese	·25
Zinc	5·
Loss	3·75
	100·

FAHLUNITE, *Tricklasite*. Occurs crystallized and massive. Primary form of the crystal a right rhombic prism, but it usually occurs in imbedded, regular, hexagonal prisms. Colour yellowish, greenish, and blackish-brown. Nearly or quite opaque. Lustre resinous. Sp. gr. 2·66 Hardness 5·0, 5·5. Streak greyish-white. Cleavage perpendicular to the axis of the prism.

It is found at Fahlun, in Sweden.

Before the blow-pipe alone it becomes grey, and fuses on its thinnest edges; with borax it melts slowly into a coloured glass.

According to Hissinger it consists of—

Silica	46·74
Alumina	26·73
Magnesia	2·97
Oxide of iron	5·11
Oxide of manganese	0.43
Water	13·50
	95·48

FAHRENHEIT. [THERMOMETER.]

FAINTING. [SYNCOPE.]

FAIOUM, a province of Egypt to the west of the Libyan ridge which bounds the valley of the Nile on the west. About 12 miles north-west of Benisouef there is a depression in the ridge about six miles in length, which leads to the plain of the Faioum. This plain is of a circular form, about 40 miles from east to west and about 30 from north to south. The northern and north-western part of this plain is occupied by the lake called Birket el Keroun, which spreads in the form of a crescent about 30 miles in length and about five miles broad towards the middle. A range of naked rocks bounds the lake to the north and joins towards the east the Libyan ridge which skirts the valley of the Nile. To the west and south the plain is bounded by lower hills which

divide it from the Libyan desert. It forms in fact a basin with only one opening or outlet to the east towards the Nile. The Bahr Yussouf, or great canal, which runs parallel to the Nile and skirts the Libyan ridge, on arriving at the gap above mentioned, at a village called Howarah Illahoun, turns to the west, passing under a bridge of three arches through which the water flows and forms a fall of about three feet at low water. It then runs along the valley, and, on reaching the entrance of the Faïoum, at the village of Howarah el Soghair, a wide cut branches off from it to the right, running first north and then north-west, and passing by Tamieh meets the north-east extremity of the lake. About two miles below Howarah el Soghair another deep ravine opens to the south, and then turning south-west, passes by Nezleh, and enters the south-west part of the lake. Between these two branches the cultivated part of the Faïoum is contained. But these two cuts have been long dyked across at their beginning, in order to economize the water of the Nile, which, owing to the rising of the bed of the Bahr Yussouf, flows less copiously than formerly. Only a small part of the water finds its way to the lake by the Tamieh and Nezleh cuts. The main stream continues its course westwards towards the middle of the plain and the town of Medinet el Faïoum, the capital of the province. Here the water becomes distributed into a multitude of small canals for irrigation, which spread in every direction through the central part of the plain, and which are the cause of its extraordinary fertility, for the Bahr Yussouf contains water all the year round. But that fertility exists only within the range of the canals. All the part west of Nezleh is arid and sandy, and only inhabited by a few nomade Arabs, though it bears the traces of former cultivation. The strip of land which borders the lake Keroun is low and marshy, marking the original basin of the lake which is separated from the cultivated lands by a considerable rise all along, reckoned by Jomard to be about 20 feet above the level of the lake. The village of Senhour, which is now some miles distant from the lake, was, in 1673, when Vansleb visited it, close to the water. Jomard reckons that when the water covered the whole of the low land below the rise above mentioned, its circumference must have been above 100 miles. [BIRKET EL KEROUN.] It is calculated that the land susceptible of cultivation in the Faïoum is about 450 square miles, of which hardly one-half is now cultivated. The villages, which are said to have been at one time above 300, are now reduced to less than 70. Still the cultivated part is superior in fertility to every other province of Egypt, from which it differs in the greater variety of its products, and the better appearance of its villages. In addition to corn, cotton, and the other cultivated plants, it produces in abundance apricots, figs, grapes, and olives, and other fruit-trees, which thrive here better than in the valley of the Nile. This was also the case in antient times, for Strabo says that ‘ the Arsinoite nome (the antient name of the Faïoum) excelled all others in appearance and condition, and that it alone produced olive trees, which were not found, elsewhere in Egypt except in the gardens of Alexandria. A vast quantity of roses also grow in the Faïoum, and this district is celebrated for making rose-water, which is sold at Cairo and all over Egypt for the use of the wealthy.

The remains of antiquities in the Faïoum are few. Two pyramids of some baked bricks about 70 feet high stand at the entrance of the valley, one near Howarah Illahoun, and the other near Howarah el Soghaïr. There is an obelisk of red granite 43 feet high, with two sides narrower than the others and a circular top, sculptured with numerous hieroglyphics, near the village of Bijige, a few miles south of Medinet el Faïoum. In Burton's *Excerpta* there is a drawing of it. Pococke i., 59, also gives a description of it. It is said to be of the same age as that of Heliopolis, bearing the name of Osirtesen I. (See an account of this obelisk in the *Library of Entertaining Knowledge, British Museum, Egyptian Antiquities*, vol. i., pp. 318—21.) Near Medinet el Faïoum are some remains of the antient Arsinoe or Crocodilopolis, consisting of fragments of granite columns and statues, described by Belzoni. At Kasr Keroun, near the south-west extremity of the lake, is a temple 94 feet by 63 and about 40 feet high, which contains 14 chambers, and appears to be of the Roman period. On the north-west bank of the lake, at a place called Denay, a raised pavement or dromos, about 1300 feet in length, leads to a building, partly of stone and partly of brick, 109 feet by 67, divided into several apartments and surrounded by an outer wall of crude brick 370 feet by 270. This is supposed to be the site of the antient Dionysias. Further to the east, but on the same bank of the lake, at a place called Kom Waseem el Hogar, are the ruins of Bacchis. The direction of the principal streets and the plans of many of the houses may be distinctly traced. The site of the antient labyrinth has not yet been ascertained; Wilkinson thinks it was near Howarah el Soghaïr, at the entrance of the plain. At Fedmin el Kunoïs, or ‘ the place of churches’ in Coptic, near the south-east bank of the lake, are some remains of early Christian monuments: the village is now occupied one half by Copts and the other half by Mohammedans, who seem to live in harmony together.

The mountains along the north bank of the lake Keroun, on which the rains fall annually, are said to contain salt, and to this circumstance the saltness of the waters of the lake is attributed by some. As the lake now receives but little of the waters of the Nile, the bitterness of its waters must have increased. No fish is said to be found in it, and Belzoni, at the time of his visit, saw nothing upon it except a crazy kind of ferry-boat.

South of the Faïoum there is an opening through the ridge of low hills leading into a smaller circular plain or basin, with a small lake called Birket el Garaq, which has one or two hamlets on its banks. A small stream from the Bahr Yussouf runs into it. The road-track of the caravans to the smaller oasis passes through this place. (*Description of Egypt and Map* in the French work; Browne; Belzoni; and Wilkinson's *Topography of Thebes*.)

FAIR, an annual or fixed meeting of buyers and sellers; from the Latin *feria*, a holiday. Fairs in antient times were chiefly held on holidays.

Antiently before many flourishing towns were established, and the necessaries or ornaments of life, from the convenience of communication and the increase of provincial civility, could be procured in various places, goods and commodities of every kind were chiefly sold at fairs; to which as to one universal mart, the people resorted periodically, and supplied most of their wants for the ensuing year. The display of merchandise, and the conflux of customers at these principal and almost only emporia of domestic commerce, was prodigious; and they were therefore often held on open and extensive plains. Warton, in his ‘History of English Poetry,’ has given us a curious account of that of St. Giles's hill or down, near Winchester. It was instituted and given as a kind of revenue to the bishop of Winchester by William the Conqueror, who, by his charter, permitted it to continue for three days. But in consequence of new royal grants, Henry the Third prolonged its continuance to sixteen days. Its jurisdiction extended seven miles round, and comprehended even Southampton, then a capital trading town; and all merchants who sold wares within that circuit, unless at the fair, forfeited them to the bishop. Officers were placed at a considerable distance, at bridges, and other avenues of access to it, to exact toll of all merchandize passing that way. In the mean time, all shops in the city of Winchester were shut. In the fair was a court called the pavilion, at which the bishop's justiciaries and other officers assisted, with power to try causes of various sorts for seven miles round. Nor could any lord of a manor hold a court-baron within the said circuit without license from the pavilion. During this time the bishop was empowered to take toll of every load or parcel of goods passing through the gates of the city. On Saint Giles's eve, the mayor, bailiffs, and citizens of the city of Winchester delivered the keys of the four city gates to the bishop's officers; who, during the said sixteen days, appointed a mayor and bailiff of their own to govern the city, and also a coroner to act within it. Numerous foreign merchants frequented this fair; and it appears that the justiciaries of the pavilion and the treasurer of the bishop's palace of Wolvesey received annually for a fee, according to antient custom, four basons and ewers of those foreign merchants who sold brazen vessels in the fair, and were called *mercatores diaunteres*. In the fair several streets were formed, assigned to the sale of different commodities, and called the *Drapery*, the *Pottery*, the *Spicery*, &c. Many monasteries in and about Winchester had shops or houses in these streets used only at the fair, which they held under the bishop, and often let by lease for a term of years. As late as 1512, as we learn from the Northumberland Household-book, fairs still continued to be the principal marts for pur-

chasing necessaries in large quantities, which are now supplied by the numerous trading towns.

Philip, king of France, complained in very strong terms to Edward II. A.D. 1314, that the merchants of England had desisted from frequenting the fairs in his dominions with their wood and other goods, to the great loss of his subjects; and entreated him to persuade, and, if necessary, to compel them to frequent the fairs of France as formerly, promising them all possible security and encouragement. (See Rym. *Fœd.*, tom. iii., p. 482.)

When a town or village had been consumed, by way of assisting to re-establish it, a fair, among other privileges, was sometimes granted. This was the case at Burley, in Rutlandshire, 49th Edw. III. (*Abbrev. Rot. Orig.*, vol. ii., p. 338.)

The different abridgments of Stowe and Grafton's Chronicles, published by themselves in Queen Elizabeth's time, contain lists of the fairs of England according to the months. There is also 'An authentic Account published by the king's authority of all the Fairs in England and Wales, as they have been settled to be held since the alteration of the style; noting likewise the Commodities which each of the said Fairs is remarkable for furnishing;' by William Owen, 12mo. Lond. 1756.

No fair or market can be held but by a grant from the crown, or by prescription supposed to take its rise from some antient grant, of which no record can be found. (2 *Inst.* 220.)

(See Dugdale's *Hist. Warw.*, pp. 514, 515; Warton's *Hist. Engl. Poet.*, vol. i., p. 279; Henry, *Hist. Brit.*, 8vo. edit., vol. viii., p. 325; Brand's *Popular Antiq.*, 4to. edit., vol. ii., p. 215.)

The fairs of Frankfort on the Mayn and Leipzig are still pre-eminent in Europe; the former held at Easter and in the months of August and September; the latter at Easter, Michaelmas, and the New Year. Leipzig at these times is the mart and exchange of Central Europe, and is visited by merchants and foreigners, from the most distant parts of the globe, sometimes to the number of thirty or forty thousand. The whole book-trade of Germany is centred in the Easter fair at Leipzig.

FAIRFAX, EDWARD, was the second son of Sir Thomas Fairfax, of Denton in Yorkshire*. The date of his birth is unknown; but as his translation of Tasso's 'Jerusalem Delivered' was published in 1600, we may suppose that it fell some time in the reign of Queen Elizabeth.

Contrary to the habits of his family, who were of a military turn, he led a life of complete retirement at his native place, where his time was spent in literary pursuits and in the education, as is said, of his own children and those of his brother, one of whom became the celebrated Lord Fairfax. We learn from his own writings that he was neither 'a superstitious Papist nor a fantastic Puritan;' but farther particulars of his life there are none. He is supposed to have died about the year 1632.

Fairfax is now known only for his translation of Tasso's 'Jerusalem Delivered,' which is executed in a manner which makes it wonderful how the frigid, jingling, and affected version by Hoole ever survived its birth. The measure which he chose for his work (that of the original Italian) is one less stately perhaps than the Spenserian stanza, but not less fitted for heroic subjects. It consists of eight-line stanzas, of which the first six lines are in *terza rima* and the last two rhyme with each other. It has this great superiority over the common heroic couplet, that all jingle is avoided by the occasional introduction of a different species of rhyme. Moreover, the verses are much more harmonious than those of Hoole; the diction is more simple, and the English more pure. As the time is now gone by when Johnson gave the law in criticism, and Pope's method of versifying was the only one in repute, we may hope to see Fairfax's translation regain its ascendancy. We may now smile at the critic who asserts that Fairfax's translation 'is in stanzas that cannot be read with pleasure by the generality of those who have a taste for English poetry†;' but we must at the same time regret that a literary school like that of the followers of Pope should have usurped for so long a time such entire dominion as to enable one of its humblest members to make assertions so sweeping and insolent as those contained in the preface from which we have just quoted. (*Biographia Britannica; Preface* to Fairfax's *Tasso*, edition 1749. *Preface* to Hoole's *Tasso*.)

* He is said to have been illegitimate, but without sufficient proof.

† Hoole, Preface to his Translation of Tasso, p. xviii.

FAIRFAX, SIR THOMAS, afterwards Lord Fairfax, the son of Ferdinando Lord Fairfax and his wife, Mary, daughter of Edmund Sheffield, Lord Mulgrave, was born in the parish of Otley, at Denton, which is situated about 12 miles north-west of Leeds. He was sent from school to St. John's College, Cambridge; but we do not find that he was eminent as a scholar, for his disposition was inclined to military employment rather than to study. Accordingly, as soon as he left college, he enlisted in the army of Lord Vere, and served under his command in Holland. The connexion of Fairfax with Lord Vere afterwards became more close. When he returned to England, he married Anne, the fourth daughter of that peer, who, like her father, was a zealous Presbyterian, and disaffected to the king. If Fairfax did not already possess the same religious and political feelings, he soon imbibed the principles of his wife. When the king began to raise troops, as it was said, for the defence of his person, Fairfax, who foresaw that it was intended to collect an army, in the presence of nearly 100,000 people assembled on Heyworth Moor, presented a petition to the king in person, praying that he would listen to his parliament and refrain from raising forces. In 1642, when the civil wars broke out, he accepted a commission of general of the horse under his father, who was general of the parliamentary forces in the north. His first employment was in the county of York, where at first the greater number of actions between the parliamentary and royalist troops were in favour of the king, whose army was under the conduct of the earl of Newcastle. Sir Thomas Fairfax, somewhat dispirited, was despatched from Lincoln, where he was in quarters, to raise the siege of Nantwich, in Cheshire. In this expedition he was successful, not only in the main object, but he also took several garrisons, and on his return defeated the troops under Colonel Bellasis, the governor of York, and effected a junction with his father's forces (April, 1644). Thus Fairfax became master of the field, and, in obedience to his orders, proceeded towards Northumberland, to enable the Scots to march southwards, in spite of the king's forces, which were quartered at Durham. A junction took place between the Scots and Fairfax, who acted in concert during the spring (1644), and fought together in the memorable battle of Marston Moor (July 2, 1644), where the king's troops experienced such a signal defeat that the whole north, excepting a few garrisons, submitted to the parliament. Before Helmesley Castle, one of these fortresses, which Sir Thomas Fairfax was afterwards (September) sent to besiege, he received a wound in his shoulder that caused his life to be despaired of. When the earl of Essex ceased to be parliamentary general [ESSEX], it was unanimously voted that Fairfax should be his successor (January, 1644-5), and Cromwell by whom his actions were afterwards so greatly influenced, was appointed his lieutenant-general. Fairfax hastened to London, where, upon the receipt of his commission, the speaker paid him the highest compliments. After having been nominated governor of Hull, he marched to the succour of Taunton, in which place the parliamentary troops were closely besieged; but upon the king's leaving Oxford and taking the field with Prince Rupert, he was recalled before he had proceeded farther than Blandford, and received orders to join Cromwell and watchfully attend upon the movements of the king. On the 14th of June the decisive battle of Naseby was fought; and when the king had fled into Wales, Fairfax, marching through Gloucestershire, possessed himself of Bath, Bristol, and other important posts in Somersetshire. From thence, by the way of Dorsetshire, he carried his arms into Cornwall, and entirely dispersed the forces of the king.

After the surrender of Exeter, which was the last event of this western campaign, Fairfax returned to Oxford, which, as well as Wallingford, surrendered upon articles. In the autumn, after further active and successful employment, he was seized with a fit of illness, under which he laboured for some weeks. In November, when he returned to London, he was welcomed by crowds who came out to meet him on his road, was publicly thanked for his services, and received from the parliament a jewel of great value set with diamonds, together with a considerable grant of money. The payment of the 200,000*l.* to the Scottish army, in consideration of which they delivered up the king, was entrusted to Fairfax, who marched northward for this pur-

pose. The discontent of the army, who were fearful either that they should be disbanded or sent to Ireland, now rose to a great height. Their complaints were encouraged by Cromwell and Ireton; a council was formed in the army by selecting two soldiers from each troop, and the Independents showed an evident desire to form a party distinct from the Presbyterians and the parliament, and to usurp for themselves a greater authority. Although Fairfax was in his heart opposed to these violent proceedings, and saw them with regret, yet he had not the resolution to resign his command. He remained the tool of Cromwell, following his counsels, until the army had become master both of the parliament and the kingdom.

In 1647 he was made Constable of the Tower; and in the following year, at his father's death, he inherited his titles, appointments, and estates. The difference of his condition made no alteration in his life; he continued to attack or besiege the royalist troops wherever they were mustered or entrenched. Many towns in the east, and among them Colchester, which he treated with great severity, yielded to his arms. In December he marched to London, menaced the parliament, and quartered himself in the palace at Whitehall. He was named one of the king's judges, but refused to act; and he was voted one of the new council of state (February, 1648-9), but refused to subscribe the test. In May he marched against the Levellers, who were numerous in Oxfordshire. He continued in command of the army until June, 1650, when, upon the Scots declaring for the king, he declined marching against them, and consequently resigned his commission. He now retired to his house at Nun Appleton, in Yorkshire, which for some years he made his principal residence. He left it (in 1659) to assist General Monk against Lambert's forces. In January, 1659-60, he made himself master of York. In the same month and in the February following he was chosen one of the council of state by the Rump Parliament, was elected one of the members for the county of York, and formed one of the committee appointed to promote the return and restoration of Charles II. In November, 1671, while residing privately at his country-house, he was seized with an illness, which terminated in his death. He was buried at Bilburgh, near York. He left issue two daughters, Mary and Elizabeth. Mary married the duke of Buckingham; of Elizabeth we have no account.

The character of Fairfax was not distinguished for many vigorous qualities; the key to it may be found in the words of Clarendon: 'Fairfax wished nothing that Cromwell did, and yet contributed to bring it all to pass. He was courageous in battle, and sincere in his professions. He had an impediment in his speech: as an orator was not eloquent; as an author was indifferent: his love of literature was of no further benefit than as it served for the encouragement of others.' (Clarendon's *Hist.*; Whitelock's *Memorials*; Rushworth's *Coll.*; *Biog. Brit.*)

FAIRIES, a small sort of imaginary spirits of both sexes in human shape, who are fabled to haunt houses in companies, to reward cleanliness, to dance and revel in meadows in the night-time, and to play a thousand freakish pranks. Both sexes are represented generally as clothed in green, and the traces of their tiny feet are supposed to remain visible on the grass for a long time after their dances: these are still called fairy rings or circles. They are also fabled to be in the practice of stealing unbaptized infants and leaving their own progeny in their stead. Besides these terrestrial fairies there was a species who dwelt in the mines, where they were often heard to imitate the actions of the workmen, to whom they were thought to be inclined to do service. In Wales this kind of fairies were called 'knockers,' and were said to point out the rich veins of silver and lead. Some fairies are fabled to have resided in wells. It was also believed that there was a sort of domestic fairies, called, from their sun-burnt complexions, *Brownies*, who were extremely useful and who performed all sorts of domestic drudgery. The words fairy and browny seem at once to point out their own etymologies.

Bourne, in his 'Antiquitates Vulgares,' supposes the superstition relating to fairies to have been conveyed down to us by tradition from the Lamiæ, or antient sorceresses; others have deduced them from the lares and larvæ of the Romans. Dr. Percy tells us, on the assurance of a learned friend in Wales, that the existence of fairies is alluded to by the most antient British bards, among whom their commonest name was that of the Spirits of the Mountains. The most general conjecture, however, is, that these imaginary people are of oriental origin, and that the notion of them was first entertained by the Persians and Arabs, whose traditions and stories abound with the adventures of these imaginary beings. The Persians called them *Peris*, the Arabs *Ginn*; and the Arabs assigned them a peculiar country to inhabit, which they called *Ginnistan*, or fairy-land.

Shakspeare has been singularly happy in his dramatic exhibition of fairies. The belief in these fabled beings has still a fast hold upon the minds of many of our rustics, which may perhaps be considered as a remnant of that ignorant credulity which was once almost universal. Poole, in his 'English Parnassus,' has given the names of the fairy court: Oberon the emperor; Mab the empress: Perriwiggin, Perriwinckle, Puck, Hobgoblin, Tomalin, Tom Thumb, courtiers; Hop, Mop, Drop, Pip, Trip, Skip, Tub, Tib, Tick, Pink, Pin, Quick, Gill, Im, Tit, Wap, Win, Nit, the maids of honour; Nymphidia, the mother of the maids. Dr. Grey, in his Notes on Shakspeare, vol. i. p. 50, gives us a description, from other writers, of fairy-land, a fairy entertainment, and fairy hunting. Dr. King's description of Orpheus' fairy entertainment (*Works*, edit. 1776, vol. iii. p. 112), and 'Oberon's clothing' and 'Oberon's diet,' in Poole's 'English Parnassus,' almost exhaust the subject of fairy economy. A charm against fairies was *turning the cloak*. See Bishop Corbet's *Iter Boreale*. Anquetil du Perron's *Zend-Avesta*; Brand's *Popular Antiquities*, vol. ii. p. 327-350; Percy's *Reliques of Antient English Poetry*, 8vo. Lond. 1794, vol. iii. p. 207-215. The reader who would look further into fairy mythology may consult Sir Walter Scott's *Essay on the Fairy Superstition*, in the *Minstrelsy of the Scottish Border*; and more especially Keightley's *Fairy Mythology*, 2 vols. 8vo. 1828, in which the legends of different countries are collected.

FAITH (fides, in Latin), means belief or trust in a fact or doctrine, and is more especially used to express the belief of Christians in the tenets of their religion, and also by figure to mean that religion itself. The great divisions of Christianity, the Roman, the Greek, the Jacobite, the Reformed, or Calvinist, the Episcopal English, and the Protestant or Lutheran churches, have each separate confessions of faith, but they all acknowledge the great fundamental points of the Christian faith or religion, namely, the inspiration of the Scriptures, and the divinity of Jesus Christ. [CONFESSION.] In the earlier ages of the church the chief controversies of theologians, especially in the East, ran upon metaphysical questions concerning the mysteries of the Trinity, the Incarnation, and the divine nature of the Saviour. In modern times controversy has run more frequently upon moral questions concerning the conduct of men, the requisites of salvation, and the discipline of the Church. Faith, the necessity of which is acknowledged by all Christians, has been viewed in various lights with respect to its efficacy. From the earliest ages the Church has taught that faith, or belief in the Redeemer, joined with good works, was necessary for the justification of man; that good works, that is, works acceptable to God, could only be produced by the Spirit of God influencing the heart, but that the human will must co-operate with grace in producing them, though the human will alone is powerless to good unless assisted by divine grace. Still, man being a free agent, the will can call on God, through the merits of the Saviour, for a measure of his grace to assist its own efforts. Thus the co-operation of God and man was held as the means of the justification and salvation of the latter. Luther however and Calvin denied the power of the will to call on God for his grace; they substituted faith, and faith alone, in the merits of the Redeemer, as the means of salvation, by which faith man firmly believes that his sins are at once remitted. But this faith must be sincere, absolute, without a shadow of doubt or distrust; and as man cannot of himself obtain this, it can only be given to him by inspiration of the Spirit of God. Here the question of faith becomes involved with those of grace and predestination. As for our works, both Luther and Calvin look upon them as absolutely worthless for our salvation. Some fanatics, and the Anabaptists among the rest, drew from these premises of the leading reformers some very dangerous consequences, which Luther and Calvin had not anticipated, such as that men might live as profligately as they pleased, and yet, by the inspiration of divine grace, might obtain the faith requisite for their salvation.

The opinions of Luther and Calvin on the subject of faith and predestination have been since considerably modified by many Protestant divines, who have admitted that the will of man must co-operate in order to obtain the grace necessary for justification. The Roman Catholic church admits the merit of good works and repentance, united with faith, for the purpose of salvation. But then, it requires an absolute faith in all the decisions of its General Councils in matters of dogma, without the least liberty of investigation on the part of the laity, and without any doubt, for doubt itself is held to be sinful. The Reformed and Protestant churches, generally speaking, hold faith in the fundamental dogmas of Christianity as an essential requisite for salvation.

FAKENHAM. [Norfolk.]

FAKI'R, an Arabic word meaning poor, which is applied to the ascetics of several parts of the eastern world. In this sense it is synonymous with the Persian and Turkish derwish. The word fakir is chiefly used in India. There are fakirs who live in communities like the monks of the western world, and others who live singly as hermits, or wander about exhibiting strange displays of self-penance and mortification. Many of them are considered as hypocrites, and others are fanatics or idiots. [Derwish.]

FALAISE, a town in France, the capital of an arrondissement, in the department of Calvados, near the source of the river Anté, which flows into the Dives: it is 127 miles from Paris, through Versailles, Dreux, Verneuil, and Argentan; in 48° 53′ N. lat. and in 0° 14′ W. long. The antient castle of Falaise was one of the residences and strong-holds of the dukes of Normandie, and here William the Conqueror was born: it sustained fourteen sieges at different times, in the early troubles of the duchy of Normandie; in the wars of Henry I. of England with his brother Duke Robert and the Norman lords; in the invasion of France by Henry V. (A.D. 1417); in the expulsion of the English from France (A.D. 1450): and in the war of the League, in which Falaise was taken by Henri IV. in person (A.D. 1589). The fortifications, which were much injured in these attacks, are at present in a very dilapidated state: the donjon of the castle, situated on a bold and lofty rock, in the suburb of Guibray, is one of the proudest relics of Norman antiquity: its walls are in some parts eight or nine feet thick.

The town stretches along the top of a rocky ridge which rises abruptly from a fertile and well-wooded valley. The streets are wide, and the public fountains impart a freshness to the appearance of the place. Before the Revolution, there were twelve churches: there are now only four; two in the town, and two in the suburbs.

The population in 1832 was 9419 for the town, or 9581 for the whole commune. The inhabitants carry on a considerable manufacture of cotton yarn and hosiery. There is a large fair held in the suburb of Guibray, which is much frequented: it continues from the 15th to the 30th of August: many Norman horses are sold. This town has a tribunal de commerce, or court for commercial affairs, a high school, an agricultural society, and a theatre.

The arrondissement of Falaise contained, in 1832, a population of 62,349. The chief manufactures carried on in it are leather and paper: there are also many oil-mills.

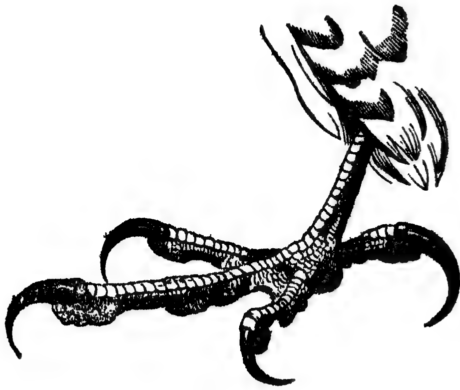
FALAJAS. [Abyssinia, p. 58.]

FALCO. [Falconidæ.]

FALCON. [Falconidæ.]

FALCONER, WILLIAM, was born about the year 1730, being one of a large family, all of whom, except himself, were deaf and dumb. When very young, he served his apprenticeship on board a merchantman, and was afterwards second mate of a vessel in the Levant trade, which was shipwrecked on the coast of Attica, himself with two others being the only survivors. This event laid the foundation of Falconer's fame, by forming the groundwork of 'The Shipwreck,' which poem he published in 1762. The notice which the poem received enabled him to enter the navy, during the ensuing year, as midshipman in the Royal George. After some other appointments, he became purser to the Aurora frigate, and was lost in her somewhere in the Mozambique Channel, during the outward voyage to India, in the winter of 1769.

Falconer was the author of a 'Nautical Dictionary' of considerable merit, as well as of some minor poems; but his chief claim to reputation consists in 'The Shipwreck,' the merit of which is owing to the vividness and power of description which pervade the work, and to the facility the author has shown in introducing nautical language. His style is formed on a model which may now be thought erroneous, and is certainly the most artificial imaginable—that of Pope; and the mixture of phrases, such as 'weather back-stays,' 'parrels, lifts, and clew-lines,' with the affectations of 'nymph,' 'swain,' 'Paphian graces,' &c., form rather a ludicrous contrast. To call 'The Shipwreck' a first-rate poem, or to compare it with the Æneid of Virgil, would not now enter into many men's thoughts, although this was done at the time when it first appeared. Some might even assert that where there is no imagination, there is no poetry; but with all these limitations we must allow that Falconer has done what no one else ever attempted, and we must give him a high place among the writers of didactic poems.

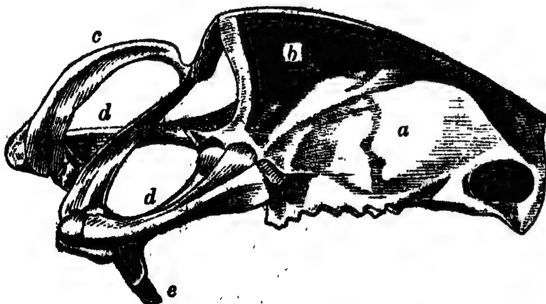


(See Clarke's and Pickering's editions of *The Shipwreck*; Irving's *Life of Falconer*; Chalmers's *Biog. Dict.*)

FALCONET, ETIENNE, was born at Paris in 1716, of poor parents, of a family originally from Savoy. He studied sculpture under Lemoyne, whom he soon surpassed. He executed several groups and statues, which are at Paris, in the church of St. Roch, in the Musée des Monumens Francais, and in several private collections. In 1766 he accepted the invitation of Catherine II. to repair to Petersburg, in order to execute the colossal statue of Peter the Great. He remained in that capital twelve years, during which he completed his work, which is now in the square called the Square of the Senate, and is perhaps the finest specimen of an equestrian statue existing. As he and the Russian founder appointed to cast the statue could not agree, Falconet cast it himself. He placed it upon an enormous block of granite, weighing about 1700 tons, which was found in some marshy ground at a considerable distance from Petersburg, and was brought to the capital by machinery. Catherine, who had shown him the greatest attention during the first years of his residence in the Russian capital, grew cool towards him at last, owing to the misrepresentations of some of her courtiers. Falconet returned to Paris in 1778. In May, 1783, as he was going to set off for Italy, a country which he had never visited, he had a paralytic stroke. He survived this misfortune several years, and died in January, 1791. In temper he was eccentric and blunt, but generous and warm-hearted. While at Petersburg he kept up a correspondence with Diderot, which is printed in Diderot's works. He wrote strictures and commentaries on the books of Pliny which treat of the sculpture and painting of the antients: he also wrote 'Observations sur la statue de Marc Aurèle,' in which he does not share in the admiration expressed by many for that work. In general, Falconet had no great veneration for antient art. All his writings were published under the title, 'Œuvres Complètes de Falconet,' 3 vols., 8vo., Paris, 1808, to which is prefixed an account of his life.

FALCO'NIDÆ, Leach's name for a family of *Raptorial Birds*, or birds of prey. (*Raptores* of Illiger.) In this family the destructive power is considered by all zoologists to be most perfectly developed; and we find in the birds composing it natural instruments for striking, trussing, and dissecting their prey, combined with a power of flight and strength of limbs equivalent to the necessities of the case, whether the prey be aërial, that is, whether it be the habit of the raptorial bird in question to strike down its quarry while the latter is in the act of flight, or whether the prey be terrestrial, or, in other words, captured on the ground. Of these natural weapons some idea may be formed from the cuts here given,—

Bill of the Peregrine Falcon.



Foot of the Peregrine Falcon.

and they are rendered still more formidable by the organization of the whole animal, which is calculated to give them the greatest possible effect. The nails or claws, to be available, must be sharp; and in order that they may be kept in this state and fit for duty, there is a provision to enable the bird to prevent them from coming in contact with the ground or other foreign hard bodies: for the claws are retractile, not indeed in the same manner as those of the cats [FELIS], which have the power of withdrawing or sheathing theirs within the integuments, but by a conformation which gives the bird of prey the power of elevating its claws at pleasure. The claws of falcons when sitting on stones or large branches of trees have often a cramped appearance; but this arises in most instances from the care of the bird so to arrange its talons that their points may not be blunted against the perch.

ANATOMY.

The power of flight, as Mr. Yarrell observes in his memoir *On the Anatomy of Birds of Prey* (Zool. Journ. vol. iii. p. 181), is one of the decided marks of the distinct organization of birds; and, as one division of the first genus, *Falco*, appears to possess this power in the highest degree of perfection, he proceeds to consider the conditions necessary to produce such a degree. These, he observes, are large and powerful pectoral muscles; great extent of surface, as well as peculiarity of form in the wing; and feathers of firm texture, strong in the shaft, with the filaments of the plume arranged and connected to resist pressure from below. 'A certain degree of specific gravity,' continues Mr. Yarrell, 'is necessarily imparted by large pectoral muscles, and the power of these muscles may be estimated by the breadth of the sternum and the depth of its keel, as affording extent of surface for the attachment of the large muscle by which the wing is depressed. As an illustration of this form the breast-bone of the peregrine falcon (*Falco peregrinus*) is represented, which ex-

Breast-bone of the Peregrine Falcon (Yarrell) reduced. *a*, the sternum; *b*, the keel; *c*, the furcula, or os furcatorius; *d d*, the clavicles; *e*, the scapula broken off.

hibits the breadth of the sternum, the depth of the keel, as well as the strength of the clavicles; and the power of flight peculiar to all the species of true falcons is still further illustrated by the form and substance of the *os furcatorius*, which is circular, broad, and strong, affording a permanent support to the shoulders. That the long and acuminated form of the wing in the true falcons, with each feather narrow, firm in consistence, the second the longest, and all gradually tapering to a point, is also best adapted for rapidity of motion, may be inferred from the example in the various species of the genera *Hirundo*, *Scolopax*, *Tringa*, *Charadrius*, *Procellaria*, *Sterna*, &c.; but that extent of surface and this peculiarity of form in the wing are not in themselves sufficient alone to afford rapid flight, is proved in the genus *Larus*, the species of which, though capable of exercising their immense pinions with graceful ease for hours in succession, without any apparent lassitude, are still incapable of rapid flight, for want of strong pectoral muscles. The numerous examples also furnished by the *Gallinaceous* tribe sufficiently evince that immense pectoral muscles are insufficient when coupled with a small round wing, and afford but a short flight, sustained with great labour, rapid in a small proportion only to the strength and repetition of the impulse, and accompanied by a vibration too well known to need further remark. So material also is the perfection of the feather in the genus *Falco*, that when any of those of the wing or tail are broken, the flight of the bird is so injured that falconers find it necessary to repair them. For this purpose they are always provided with pinion and tail feathers accurately numbered, and the mode of uniting the more perfect feather to the injured stump is described in Sir John Sebright's excellent observations on hawking.' The reader who is disposed to go farther back will find in the 'Booke of Falconrie or Hawking,' &c., &c., 'heretofore published by George Turbervile, Gentleman,' (London, small 4to., 1611,) the following chapters:—'Of Accidents that happen and light uppon a hawkes feathers, and first how to use the matter when a feather cannot be ymped.' 'The way and manner how to ympe a hawks feather, howsoever it be broken or bruised;' and four methods of operating, according to the circumstances, are detailed. 'How to ympe the trame of a hawke beeing all broken, and never a feather whole or sound.' Mr. Yarrell proceeds to observe that it is difficult to estimate the comparative rapidity of flight in different birds, and that our pigeons may appear to possess this advantage in a degree little inferior to the true falcons: but, he adds, the fact is that these birds are deficient in natural courage, and are unable, under circumstances, to avail themselves of those powers with which they are gifted.

'The bodies of all the species of true falcons,' writes Mr. Yarrell in continuation, 'when denuded of their feathers, are triangular in form, broad at the shoulders and tapering gradually to the tail, the muscles of the thighs and legs of great size; but these characters are less prominent in the hawks, the bodies of which are more lengthened, the legs long and slender, the pectoral muscles smaller, the wing rounded in form, the fourth feather the longest, the wing primaries broad in the middle, the inner webs overlapping the feather next in succession, and emarginated towards the end. These two divisions of the genus *Falco*, although the latter are unequal to the former in powers, are remarkable for their bold character and rapid flight, their invariable mode of striking their prey on the wing, as well as the instinctive knowledge by which they are directed to destroy life, attacking the most vital part, and penetrating the brain with their sharp hooked beak, either by one of the orbits where the bone is very thin, or at the junction of the cervical vertebræ with the occiput.

'On comparing the bones of our two British eagles, the greater power of flight appears to belong to the *Albicilla*, that of prehension to the golden eagle, but both exhibit various indications of great strength.

'By an extended examination of the different species of buzzards and harriers, it will be found that the characters described as necessary to produce rapid motion decline gradually. The sternum decreases in size, the keel loses part of its depth, the clavicles and furcula become more slight, while the form of the cranium, the loose ruffled feathers of the neck, as well as the general downy texture of the plumage, indicate the approach to the genus next in succession. Of the bones of the different species of the genus *Falco* generally, it may be added, that they are remarkable for their strength, such as are cylindrical being furnished with numerous transverse bony processes within the tubes, and the distribution of air throughout their internal cavities. The humerus is supplied with air through several orifices upon its inner and upper surface, and some difference will be found in the angle at which this bone is articulated with the clavicle to accomplish the ascending flight of the sky

lark, in contradistinction to the precipitous horizontal direction of the falcons. The thigh bone is also supplied with air by an orifice at the situation which answers to the front of the great trochanter; the large bones forming the pelvis, the vertebræ, sternum, furcula, clavicles, scapulæ, and even the ribs, are all furnished with apertures for the admission of air, supplied from the various cells of the abdomen, sides, and thorax. This distribution of air to the bones does not seem however to be absolutely necessary for flight, since the young birds of our summer visitors appear to perform their first autumnal migration with perfect ease and celerity, at an age when the cavities of their bones are filled with marrow.

'The various characters of the feet are too obvious to require particular notice.'

The reader is referred to the article BIRDS for the details of the rest of the skeleton of the *Falconidæ*, as exemplified in the *Sparrow Hawk* (vol. iv., pp. 424, 425); and we shall now endeavour to give a sketch of the other internal parts worthy of notice, and especially of the organs of the senses.

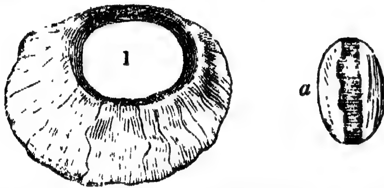
Organs of Digestion.—In the Museum of the Royal College of Surgeons in London (Physiological Series), the reader will find a preparation (Gallery, 522 A.) of the stomach of the golden eagle. It is laid open, so as to show the orifices of the numerous gastric glands of the proventriculus, the smooth lining membrane of the gizzard, and the valvular structure of the pylorus. The œsophagus is very wide, so that externally it appears to form one continued cavity with the proventriculus and stomach. On the outer surface of the latter may be observed the two shining tendons from which the muscular fibres radiate; these however form a very thin layer in this and other carnivorous birds. A small quill is passed through the pylorus, which is guarded within by three cuticular tubercles, two on the upper side of the orifice and one below which fits into the interspace of the preceding. The crop has not been preserved in this preparation. (*Cat., Physiol. Series*, vol. i.) John Hunter, in his 'Observations on Digestion' (*Animal Œconomy*), says, 'There are few animals that do not eat flesh in some form or other, while there are many who do not eat vegetables at all; and therefore the difficulty to make the herbivorous eat meat is not so great as to make the carnivorous eat vegetables. Where there is an instinctive principle in an animal, directing it either to the one species of food or the other, the animal will certainly die rather than break through of its own accord that natural law; but it may be made to violate every natural principle by artificial means. That the hawk tribe can be made to feed upon bread I have known these thirty years; for to a tame kite I first gave fat, which it ate very readily; then tallow and butter; and afterwards small balls of bread rolled in fat or butter; and by decreasing the fat gradually, it at last ate bread alone, and seemed to thrive as well as when fed with meat. This, however, produced a difference in the consistence of the excrements; for when it ate meat, they were thin, and it had the power of throwing them to some distance; but when it ate bread, they became firmer in texture, and dropped like the excrement of a common fowl. Spallanzani attempted in vain to make an eagle eat bread by itself; but by inclosing the bread in meat, so as to deceive the eagle, the bread was swallowed and digested in the stomach.'

Mr. Yarrell observes, that the œsophagus offers nothing peculiar beyond that of other birds not possessing the power of minutely dividing their food. It is plicated lengthways, allowing great extension, and its separation from the stomach is marked by a zone of gastric rings. The same author notices an opportunity which occurred to him of observing the castings or pellets of some eagles, which had been occasionally fed with dead pigeons. These castings showed that the vegetable food, such as pease, wheat, and barley, which had been swallowed by the eagles in the crops of the pigeons, remained entire, but somewhat enlarged and softened by heat and moisture. In these cases no part of the bones remained.

The intestines of the *Falconidæ* are in general short and large, but Mr. Yarrell remarks that the Osprey is an exception to this rule, and that to the thin membranous stomach of this bird there is attached an intestinal canal measuring 10 feet 8 inches in length, and in some parts scarcely exceeding a crow-quill in size. The canal in most of the species, he adds, is in length, compared with that of the bird itself, as three to one; but in the Osprey it is as eight to one: and he observes that in the otter the intestinal canal is very long, equal in size, and without cæcal appendage; the seal, too, has long intestines with a small cæcum. Mr. Yarrell inquires therefore if it may not be concluded that the small quantity of nutriment which fish, as an article of food, is known to afford, renders this extent of canal necessary in order that every portion may be extracted. The cæca of the *Falconidæ* amount to no more than minute rudiments.

Organs of Respiration.—There is nothing very remarkable in these organs among the Falconidæ. The trachea is composed of two membranes, inclosing between them numerous bony rings, forming a more or less perfect tube. The rings are strong and compressed. The point of divarication, the cross-bone and bronchiæ constituting together the inferior larynx, are of the most common form, having but one pair of muscles attached; and the voice, though powerful, possesses, as might be expected, but little variation. (Yarrell.) *Falco musicus* seems, however, to be an exception, and it would be desirable to examine its trachea for the purpose of ascertaining whether it is not organized more after the fashion of that of the singing birds.

Organs of Sense.—Touch.—It might be expected that in the *Falconidæ* the soles of the feet and lower surfaces of the toes which come so closely into contact with the living prey would be endowed somewhat more largely with the sense of touch than those of birds which have no such habits; accordingly, we find in the Museum of the College of Surgeons (Physiological Series) a preparation (No. 1400) of one of the feet of an eagle, with the cuticle removed, showing the papillæ and cushions of the cutis on the under surface of the foot.



Taste.—In the same Museum (same series, No. 1482) will be found the tongue, larynx, and lower jaw of the Golden Eagle (*Aquila chrysaëtos*). The tongue is fleshy and large, divided into two lateral portions by a deep longitudinal furrow; at its base is a series of small retroverted spines, arranged in the form of a chevron, between which and the larynx the surface is studded with the orifices of numerous glandular follicles: two rows of retroverted spines again occur behind the larynx. There is a row of glandular follicles on either side of the frænum linguæ, and a large cluster of similar orifices immediately anterior to it. The preparations No. 1483 and 1484 exhibit respectively the tongue and fauces of an Erne (*Haliæetus albicilla*), and the tongue and larynx of an Osprey (*Pandion haliæetus*).

Smell.—A longitudinal section of the anterior part of the head of the Golden Eagle will be found in the same Museum and series (No. 1538). The preparation shows the turbinated cartilages and cavity of the nose, together with part of the orbit and the air-cell continued from it anteriorly, and situated below the nose. The parts are minutely injected, and the vascularity of the pituitary membrane covering the middle turbinated cartilage is well displayed. No. 1539 is a transverse section of the head of an Erne (*Haliæetus albicilla*), showing the convolutions of the middle turbinated cartilages, and the disposition of the pituitary membrane, which is thickest on the convex or mesial side of the convolutions. The air-cells in the superior maxillary bones, and their communications with those which are situated in front of the eye-ball, are well seen in this preparation. Bristles have been inserted into the lachrymal ducts, and into the common termination of the Eustachian tubes, the respective conduits of the eye and ear for conducting their superfluous moisture to the nasal passages. An anterior transverse section of the head of the same eagle is shown in No. 1540, which exhibits the external nostrils, the anterior terminations of the middle turbinated cartilages, and of the lachrymal ducts, in which bristles are placed; together with the communications of the maxillary air-cells with the cancellous structure of the upper mandible. (*Cat. Gallery*, vol. iii.)

Hearing.—Nothing remarkable.

Sight.—'The extraordinary powers of vision,' says Mr. Yarrell, 'which birds are known to exercise beyond any other class of animals are in no genus more conspicuous than in that of *Falco*. Their destination, elevating themselves as they occasionally do into the highest regions, and the power required of perceiving objects at very different distances and in various directions, as well as the rapidity of their flight, seem to render such a provision necessary. The eyes of birds are much larger in proportion than those of quadrupeds, and exhibit also two other peculiarities. The one is the marsupium, a delicate membrane arising at

the bottom of the eye, and terminating at or near the edge of the crystalline lens: the other is a ring of thin bony plates, enveloped by the sclerotic coat. Comparative anatomists do not seem to be agreed as to the means by which birds obtain their power of vision, whether by an alteration in the form or situation of the crystalline lens, or by both, either or both of which, the greater quantity of aqueous humour which birds are known to possess would seem to facilitate. The existence of muscle attached to the inner surface of the bony hoop of the sclerotica, and inserted by a tendinous ring into the internal surface of the cornea, as shown by Mr. Crampton,* by which the convexity of the cornea may be altered, gives a still greater scope of action, since with two or at the utmost three varieties of powers, the sphere of distinct vision may be indefinitely extended. Whether the five species called the True Falcons possess, with their exclusive rapidity of flight, any power of vision beyond their generic companions, would be difficult to ascertain; but it may, while on this subject, be worthy of remark, that the irides of the *Gyrfalcon, Peregrine, Hobby, Merlin,* and *Kestrel,* are hazel-brown, or still darker, while those of all the hawks, buzzards, harriers, and kites, are of various shades of yellow. I refer only to adult birds, and do not remember a single exception.'

1, bony ring of a Golden Eagle; 2, crystalline lens of the same bird; *a*, the anterior surface, somewhat less convex than the posterior one (Yarrell).

Mr. Yarrell observes, that the number of bony plates forming this circle in the Golden Eagle is fifteen; in the White-tailed Eagle there are but fourteen: and he adds, that the external convex form of the bony ring in the Golden Eagle will be found to extend through all the species of every genus of British birds, except the owls, in all of which it is concave.

In the Museum of the College of Surgeons (*Physiological Series, Gallery*) are the following preparations illustrative of this part of the subject. No. 1741. The head of an eagle, with the eyes *in situ*. In the left eye the anterior part of the tunics and the humours have been removed to show the retina expanding from the oblique line by which the optic nerve terminates, and the vascular processes of the *marsupium* extending forwards from the centre of the optic fissure. In the right eye a lateral section of the coats has been removed, together with the humours and a great part of the *retina*, showing the uniformly dark-coloured choroid, the thin but dense texture of the *sclerotica*, and the zone of osseous plates which supports the projecting *cornea*. The *marsupium* is preserved *in situ*. It is of an unequal quadrilateral figure, broadest below, and extending upwards and inclined a little backwards, with a slight convexity towards the nasal side of the eye-ball. The large size of the eyes is worthy of notice. No. 1742 exhibits a longitudinal section of the eye of an eagle, showing the oblique manner in which the optic nerve perforates the *sclerotica* and its extended termination, from which the *retina* expands in a plicated manner: only the folds at its origin are here preserved. The parts being minutely injected, the vascularity of the choroid is shown; also the breadth of the ciliary zone, the breadth and thickness of the bony imbricated hoop surrounding the base of the *cornea*, the thickness of the *cornea* itself, and the large size of the anterior chamber of the eye. No. 1743 is the eye of an eagle, with a portion of the coats removed from one side, showing the folds of the marsupial membrane, from which the colouring matter has been removed. In No. 1538 above alluded to portions of the eye and eye-lids with the nictitating membrane are preserved, showing the situation of the two *puncta lachrymalia*, through which bristles are passed along the ducts to the nose; and in No. 1539, at the back part of the preparation, the left eye-ball is laid open, showing the marsupial membrane. The right eye-ball is entire, and the *abductor, attollens,* and *deprimens oculi*, together with the *quadratus* and *pyramidalis* muscles of the *membrana nictitans*, are well displayed. See also No. 1540, as referrible to the organs of vision. No. 1796 exhibits the eye-ball, with portions of the horizontal eye-lids, the vertical eye-lid, or *membrana nictitans*, of an eagle. The *quadratus nictitantis* may be observed to have a more extensive origin than in the ostrich and both muscles of the third eye-lid are relatively larger. The *cornea* is cut away, and the nictitating membrane raised, to show the termination of the duct of the Harderian gland, in which a bristle is placed. Bristles are also placed through the two *puncta lachrymalia*. The round and slightly concave tarsal cartilage of the lower eye-lid may be observed: the upper lid has no tarsal cartilage. In No. 1797 the three eye-lids of an eagle are exhibited, and the tarsal cartilage, which is raised as in the act of closing the eyes, is shown. (*Cat. Gallery*, Physiol. Series, vol. iii.)

* Annals of Philosophy for March, 1813

NATURAL HISTORY.

Aristotle divided the *Falconidæ* into 'Αετοὶ or Αἰετοὶ (Eagles), 'Ιέρακες (Hawks), and 'Ικτῖνοι (Kites), with many subdivisions. Mr. Vigors is of opinion that the division 'Ιέραξ (Hierax) of Aristotle comprises all the Falconidæ of Vigors which belong to the stirpes or sub-families of *Hawks, Falcons,* and *Buzzards*. Pliny separates the group into *Aquilæ* (Eagles) and *Accipitres*, a general term comprising as used by him, the rest of the *Falconidæ*. The subdivisions of both Aristotle and Pliny do not differ much from the subdivisions of some of the modern zoologists.

Belon, beginning with the Vultures, proceeds from them to the Eagles; thence to the *Gerfault*, which he gives as the *Morphnos, Morphna, Nittophonos, Plangos, Plancus, Plangus,* and *Clangus* of the Greeks, and *Anataria* of the Latins; next he places the *Orfraye*, which he makes the *Haliæetus* of the Greeks, the *Aguista piombina* of the modern Italians, and gives *Aquila marina* as the Latin name. He then treats of the *Ossifragus* as the *Phinis* of the Greeks, *Aquila barbata* in Latin, recording it provisionally as a species of *Vulture* (*Petit vautour*), and next describes the *Buzzard* (Buse ou Busard) as a kind of *bastard Eagle*, and as the *Gypäetos, Percnopterus,* or *Oripelargus* of the Greeks. Then comes the *Goiran* or *Boudree*, which he describes as living upon rats, mice, frogs, lizards, &c., caterpillars, and sometimes slugs and serpents, asserting that it becomes very fat, and that it is taken frequently in winter for the sake of its flesh, which is good for food. This he supposes to be the *Hierax*, called *Phrynolochos* by the Greeks, and gives *Rubetarius Accipiter* as the Latin name. *Jean le Blanc*, or *Oyseau Saint Martin*, which he considers to be the *Pygargus* of the Greeks, follows, and is succeeded by another *Oyseau Saint Martin*, or *Blanche-queuë*. Belon then gives an account of the birds of prey employed in falconry. The *Sacre* and her *Sacret*, the *Autour* and her *Tiercelet*, the *Fau-perdrieux* (Circus?), and the *Falcons* generally, with their *Tiercelets*.* He then describes the *Hobreau* (Hobby?), the *Esmerillon* (Merlin?), the *Espervier* (Sparrowhawk?), the *Lanier* and *Laneret*, and the *Cresserelle* (Kestrel?). Next follow the *Butcher-birds*, then come the *Kites* (Milan Royal, Milan Noir—Milvus), and (the *Cuckoo* intervening from a supposed similitude to the Birds of Prey) the *Owls*.

Passing by Gesner, Aldrovandus, and Jonston, we pause to notice Willughby's arrangement. He separates the carnivorous and rapacious birds, called *Birds of Prey*, into the *Diurnal* (those that prey in the day-time) and the *Nocturnal* (those that fly and prey by night). The following is his table of the *Diurnal* section.

- Diurnal
  - The *Greater*, and these either
    - The *more generous*, called *Eagles*: the *Golden Eagle*, the *Sea-Eagle*, the *Black Eagle*, &c.
    - The *more cowardly* and *sluggish*, called *Vultures*.
  - The *Lesser*, called in Latin *Accipitres*
    - The *more generous*, that are wont to be reclaimed and manned for fowling, called *Hawks*, which our falconers distinguish into
      - *Long-winged*, whose wings reach almost as far as the end of their train, as the *Falcon*, *Lanner*, &c.
      - *Short-winged*, whose wings when closed fall much short of the end of their trains, as the *Goshawk* and *Sparrowhawk*.
    - The *more cowardly* and *sluggish*, or else *indocile*, and therefore by our falconers neglected, and permitted to live at large
      - The *Greater*.—The *Common Buzzard*, *Bald Buzzard*, &c.
      - The *Lesser*
        - *European*; BUTCHER BIRDS or SHRIKES.
        - *Exotic*; BIRDS OF PARADISE.

* It is a general rule that, in the *Falconidæ*, especially among the nobler birds of prey, the female is larger than the male.

Ray, in his 'Synopsis,' follows Willughby, and both Ray and Willughby place the Cuckoo after their Diurnal Birds of Prey and immediately before the Nocturnal.

Brisson's third order consists of birds with a short and crooked beak, and the first section contains the genera *Epervier* (Hawk), *Aigle* (Eagle), and *Vautour* (Vulture).

Linnæus makes his first order, *Accipitres*, consist of the genera *Vultur*, *Falco*, *Strix*, and *Lanius*. The genus *Falco* contains the elements of the different branches of the family of *Falconidæ*.

Without entering into the methods of Buffon, Schœffer, and Scopoli, we proceed to that of Latham, who made the *Accipitres* his first order of Terrestrial Birds, containing the genera *Vulture*, *Falcon*, and *Owl*.

Pennant makes the *Rapacious Birds* (his first section) consist of two genera only, viz. *Falcon* and *Owl*.

M. de Lacépède placed the *Birds of Prey* (his seventh order) at the head of his second Division of Birds. His genera are *Vultur*, *Gypaëtos* (Griffon), *Aquila*, *Astur*, *Nisus*, *Buteo*, *Circus*, *Milvus*, *Falco*, and *Strix* (Owl).

M. Duméril divided his first order, *Rapaces*, into three families; the first *Nudicolles* or *Ptilodères*, consisting of the genera *Sarcoramphus* and *Vultur*; the second *Plumicolles* or *Cruphodères*, containing the genera *Griffon*, *Messager*, *Aigle*, *Buse*, *Autour*, and *Faucon*; and the third the *Nocturnes* or *Nycterins* (Owls).

Blumenbach's first order, *Accipitres* (Birds of Prey, with strong hooked bills and large curved talons, a membranous stomach, and short cæca) consists of the genera *Vultur*, *Falco*, *Strix*, and *Lanius*.

Meyer's first order, *Rapaces*, is divided into two suborders: first, the *Scleropteræ*, or *Diurnal Birds of Prey*; second, the *Malacopteræ*, the *Nocturnal Birds of Prey*.

The third order of Illiger, *Raptatores*, is composed of the *Nocturni* (Strix), the *Accipitrini* (Falco, Gypogeranus, Gypaëtus), and the *Vulturini* (Vultur, Cathartes).

Cuvier divides his first order (the Birds of Prey) into *Diurnal* and *Nocturnal*. The first are subdivided into the *Vultures* and the *Falcons* (Falco, Linn.), which last are separated into the *Noble Birds of Prey*, or *Falcons properly so called* (Falco of Bechstein), comprising the genera *Faucon* (Falco) and the *Gerfaults* (Gyr-falcons, *Hierofalco* of Cuvier); and the *Ignoble Birds of Prey*, consisting of the *Eagles* (Aquila of Brisson), which are subdivided into the *Eagles properly so called* (Aquila of Cuvier), the *Aigles-Pêcheurs* (Fishing Eagles, with comparatively long wings, *Haliæetus* of Savigny), the *Balbusards* (Pandion of Savigny), the *Circaètes* (Circaetus, Vieillot, *Jean le Blanc*, &c.), the *Caracaras*, (Polyborus, Vieillot, and Ibycter, Vieillot), and the *Harpies* or Fishing Eagles, with short wings, (Harpyia of Cuvier; the tribe *Cymindis* of Cuvier; the *Aigles-Autours* (Morphnus of Cuvier, Spizaëtos of Vieillot); the *Autours* (Astur of Bechstein, Dædalion of Savigny); the *Milans* (Milvus of Bechstein, Elanus of Savigny); the *Bondrées* (Pernis of Cuvier, Honey Buzzard); the *Buses*, Buteo of Bechstein; the *Busards* (Circus of Bechstein); and the *Messager* or *Secrétaire* (Serpentarius of Cuvier, Gypogeranus of Illiger).

Vieillot divides his first order, *Accipitres*, into the *Diurnal* and *Nocturnal* tribes, making the first tribe to consist of three families; 1st. *Vautourins*, among which he places the *Caracara*; 2nd. *Gypaëtes*; 3rd. *Accipitrins*, consisting of the genera *Aigles*, *Pygargue*, *Balbuzard*, *Circaëte*, *Busard*, *Buse*, *Milan*, *Elanus*, *Ictinie*, *Faucon*, *Physète*, *Harpie*, *Spizaëte*, *Asturine*, *Epervier*.

Temminck's first order, *Rapaces*, comprises the genera *Vautour*, *Catharte*, *Gypaëte*, *Messager*, *Faucon*, *Chouette*.

Mr. Vigors thus arranges the *Falconidæ*.

TYPICAL GROUPS.

Beaks short, strongly toothed. Prey aërial.	Wings short.	Sub-family, *Accipitrina*. HAWKS.
	Wings long.	Sub-family, *Falconina*. FALCONS.

ABERRANT GROUPS.

Beaks long, or sublong, not toothed. Prey terrestrial.	Beaks hooked (adunca) from the base. Wings long.	Sub-family, *Buteonina*. BUZZARDS.
	Beaks hooked from the base; Tail forked. Wings very long.	Sub-family, *Milvina*. KITES.
	Beaks hooked at the apex only. * Long-winged. ** Short-winged.	Sub-family, *Aquilina*. EAGLES.

De Blainville divides the *Raptatores* into the *Diurnal* and the *Nocturnal*. The former he divides into the *Anomalous* (the Secretary, Serpentarius); and the *Normal* (Falco, Linn.).

M. Latreille separates his first order of terrestrial birds (*Rapaces*) into two tribes—the diurnal and the nocturnal. The first contains two families: 1st, The *Vautourins* (Vultures); 2nd, The *Accipitrins*. The latter consists of the genera *Aigle*, *Pygargue*, *Balbuzard*, *Harpie*, *Aigle-Autour*, *Asturine*, *Messager*, *Autour*, *Epervier*, *Elane*, *Milan*, *Bondrée*, *Buse*, *Busard*, *Faucon*, *Gerfault*.

C. L. Bonaparte (Prince of Musignano), in his 'Tabella Analitica,' divides his 'Ordine' *Accipitres* into the 'Famiglia *Vulturini*,' and the 'Famiglia *Rapaces*.' These last he separates into the *Diurni*, with eyes on the sides of the head, 'Occhi nei lati,' and the *Nocturni*, with eyes in the face, 'Occhi sulla faccia.' His diurnal rapacious birds consist of two genera, viz., *Gypaëtos* and *Falco*. The latter comprises the following sub-genera:—*Aquila*, *Haliaëtos*, *Pandion*, *Falco*, *Astur*, *Milvus*, *Elanus*, *Buteo*, *Circus*.

M. Lesson, in common with other zoologists, separates his first order, the *Birds of Prey*, *Accipitres*, or *Rapaces*, into the diurnal and nocturnal. The first embraces three families:—1st, The Vultures; 2nd, The Falcons, or *Falconidæ*, which he subdivides into the *Noble Birds of Prey*, viz. the genera *Falco*, *Hiero-Falco*, *Physeta*, and *Gampsonyx*; and the *Ignoble Birds of Prey*, viz. the genera *Aquila*, *Haliæetus*, *Pandion*, *Circaëtus*, *Caracara*, *Harpya*, *Morphnus*, *Cymindis*, *Astur*, *Nisus*, *Milvus*, *Ictinia*, *Elanus*, *Nauclerus*, *Pernis*, *Buteo*, *Circus*. 3rd, The *Messagers*, or *Serpentarii*, consisting of one genus only, *Serpentarius*, the Secretary Falcon.

Mr. Swainson (*Fauna Boreali-Americana*) remarks that in contemplating the *diurnal birds of prey*, arranged by Linnæus under the genus *Falco*, we can be at no loss to discover the two typical forms in the *Toothed-billed Falcons* and the *Sparrow-hawks*. Their peculiarities, he adds, did not escape the notice even of the earliest systematic writers, and the moderns, he observes, have only confirmed the justness of the distinction. But with regard to the remaining groups, he states that much diversity of opinion still exists; not, indeed, as regards the leading divisions, for here likewise the antients had long ago anticipated our distinctions between the *Eagles*, *Kites*, and *Buzzards*. It is not, therefore, to these groups, taken *per se*, that any doubts can attach on their respective peculiarities, but rather as to their relative rank with those that are considered typical. These doubts, in Mr. Swainson's opinion, can only be solved by analysis; and from an attentive consideration of the difficulties arising from the want of materials in our museums, and other causes, he has been induced to dissent from several modern writers upon this family. He admits that it has been sufficiently proved that the various forms of which it is composed exhibit, as a whole, a circular succession of affinities; but the true series of the secondary groups, among themselves, has not, he asserts, yet been made out: he adds however, that the inability to state in what way the falcons or hawks form their own respective circles cannot militate against the belief that such is their true distribution. 'It remains, therefore,' continues Mr. Swainson, 'to be considered whether there is presumptive evidence to believe that the three remaining divisions, namely the *Buzzards*, *Kites*, and *Eagles*, form one circular group, independent of their affinity to the two former. The true *Buzzards*, of which the *Vulgaris* and the *Lagopus* may probably be types, are slender long-winged birds; the bill is small, short, and considerably curved: in this structure they agree with the true falcons, yet they are well known to be distinguished from them by wanting the toothed-bill, and by the shortness and graduated abbreviation of the exterior quill-feathers. Now, if Nature had proceeded in a simple course from the buzzards to the falcons, we should have had birds uniting the distinctions of both variously modified. Both these groups being composed, in their typical examples, of slender long-winged birds, with short bills, any species exhibiting the reverse of such characters, and intervening between the two forms, would certainly appear anomalous, on the supposition of a simple series of affinities being aimed at. Yet, that such birds are to be found, even among the few that we are subsequently to notice, is unquestionable. Let us then take the *Buteo borealis*, which, as being more allied to the falcons than to the kites, may be considered an intervening

form between tne *Buteo vulgaris* and *Falco*. We here see a large-sized, heavy bird with shortened wings, not reaching to more than half the length of the tail; while the elongated bill, unlike either that of *Buteo* or *Falco*, obviously assimilates to that lengthened form which belongs to the eagles. Now, upon the supposition that a bird so constructed is intended to fill up the interval between *Buteo* and *Falco*, and at the same time to unite the former with the *Eagles*, the singularity of its structure is no longer surprising: but if we consider it with a simple reference to the passage between *Buteo* and *Falco*, we are almost tempted to suspect that, in this instance, a real *saltus* has been made. While upon this subject we may cite an acute observation made by Prince C. Bonaparte, that 'the *Borealis* is almost as much an *Astur* of the first section as a *Buteo*;' a proof, at least, that its affinities to *Astur* and to the aberrant eagles adjoining that group have not escaped observation. Our idea that the buzzards are truly united to the eagles is still further strengthened by the *Buteo pterocles*, Temm. * * *. In this species the wings, as in *Buteo*, are remarkably long, but the bill is so considerably lengthened, that were we to judge alone from this member, we should have no scruple in placing the bird among the *Aquilæ*. On the other hand, it must be remembered that, as every group, from the highest to the lowest denomination, when perfect, contains a representation of the other four, united to a form peculiar to itself, so we might naturally expect that one division of the buzzards would represent the true eagles. To ascertain, therefore, whether the resemblances above stated are those of analogy or of real affinity, recourse must be had to strict analysis. Now this, in our present state of knowledge, cannot be done, at least from the resources to be found in this country. We have thought it advisable to cite the above facts, drawn from the structure of the birds themselves, as likely to awaken the attention of ornithologists to a further investigation of the subject; they will, at least, show that our opinion on the unity of the three aberrant groups is not entirely without foundation. Mr. Swainson considers the relative value of the whole group equivalent to that of *Vultur* or *Strix* in its own order, and to the families composing the *Rasores*, *Grallatores*, and *Natatores*, and he contemplates the five principal divisions as *genera*, arranging the subordinate forms as *sub-genera*; but in considering the five forms of the *Falconidæ* as genera, rather than sub-families, he guards himself against the supposition that he may mean to insinuate that the minor distinctions which have been dwelt upon by several able ornithologists who have investigated this family, are either trivial, or that they deserve not to be brought immediately before us. On the contrary he recommends to others the plan adopted by himself, viz. the minute examination of every change of structure, and the assembling together in minor groups such species as agree in certain peculiarities. Further, he would proceed, in certain cases, even to impose a name upon such groups. but in a family already so crowded by generic names he considers it essential to preserve a distinction between groups of unequal value; and not to elevate sub-genera, or forms of transition, to a rank they do not hold. *Milvago*, *Polyborus*, *Daptrius*, and *Ibycter*, are, unquestionably, in his opinion, of the latter description, each confined but to one species, and he says that he has another of the same natural group in his cabinet, equally deserving a patronymic name. By regarding these as genera, each, as he thinks, is made equivalent to the whole genus of typical falcons; whereas, by representing them as lesser variations, which he considers them in truth to be, the student immediately perceives that their station is subordinate.

The genera into which Mr. Swainson divides the *Falconidæ* are *Falco*, *Accipiter*, *Buteo*, *Cymindis*, and *Aquila*; and he gives the following table as the concentration of his remarks in reference to the sub-genera of *Falco*:*

Sub-genera of Falco.		Genera of the Falconidæ.
	1. Typical group.	
Falco.	Pre-eminently typical; bill acutely toothed; wings pointed, rather long.	Falco.
	2. Sub-typical group.	
Harpagus.	Wings shorter, rounded; tarsi with entire transverse scales.	Accipiter.
	3. Aberrant group.	
Lophotes.	Feet short; head crested.	Aquila.
Aviceda.	Feet small, very short; soles broad and flattened; outer toe and claw shortest.	Cymindis.
Gampsonyx.	Bill neither notched or (nor) festooned; head small; feet strong.	Buteo.

* Natural History and Classification of Birds. London, 1836.

By throwing each of these columns into their respective circles, and then bringing them into juxtaposition (which he does in the work quoted) the same results, he remarks, will follow. Into the accipitrine circle he admits *Ictinia*, provisionally, *Accipiter* (type), *Astur* (Goshawks), *Haliæetus* (*H. Pondicerianus*), and no more. In the Aquiline circle he retains four 'types,' viz. *Pandion*, *Harpyia*, *Aquila*, and *Ibycter*. In the Cymindian or Milvine circle he places *Polyborus*, *Cymindis*, *Elanus*, *Nauclerus*, and *Circetus*, the last with a query, and in the cut of the circle it is not mentioned. In the Buteonine circle *Milvus*, *Circus*, and *Buteo*.

Mr. Vigors who, as we have seen, first proposed the application of the Quinary System to the *Falconidæ*, and indeed to the birds in general, thus defines the family which is the subject of our inquiry, and thus follows out his arrangement.

Falconidæ. (Leach.)

Head plumose. *Beak* strong, hooked, with a cere at the base. *Nostrils* lateral, more or less rounded, open and situated in the cere. External *toes* especially connected with the middle toes. *Claws* or *nails* strong, very sharp, very much incurved, and retractile:*

1st. Sub-family, *Aquilina*.

Beak long, hooked at the apex only. Fourth quill the longest.

*

Long-winged Eagles.

Genera. Ibycter. (Vieillot.)

Beak convex above. Lower *mandible* notched at the apex, and subacute. *Cere* naked. *Cheeks*, *throat* (gula) and *crop* (jugulum) featherless. *Claws* acute.

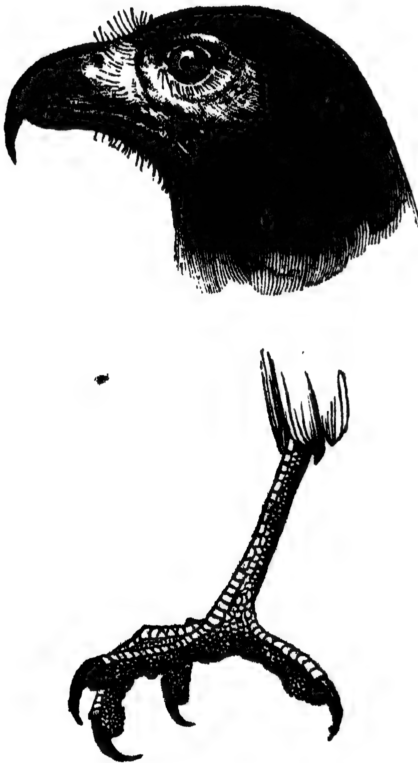
Mr. Vigors remarks that the type of this genus is *Falco aquilinus* of Gmelin, *Petit Aigle d'Amerique* of Buffon, and that he believes it still stands single in the genus.

Description. *Beak* cærulean; *cere* and *feet* yellow; *orbits* yellow; *irides* orange; *body*, above, cærulean; below, red going into white; *neck* purplish to rufous; *claws* black. Gmelin gives it as the *Red-throated Falcon* of Latham.

Locality, South America.

Head and Foot of Ibycter Aquilinus.

* The characters of the sub-families and genera are from those given by Mr. Vigors.



Daptrius. (Vieillot.)

Beak convex above. Lower *mandible* angular beneath, notched at the apex, obtuse. *Cere* with scattered hairs. *Orbits, throat*, and *crop*, featherless. *Claws* acute.

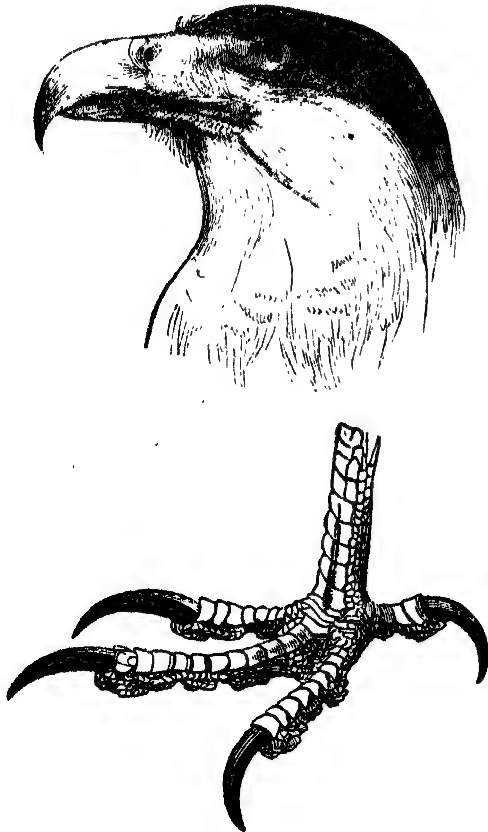
'How far,' writes Mr. Vigors, 'the two preceding genera of M. Vieillot are sufficiently distinct from each other, or from the remainder of the naked-cheeked *Eagles*, it is not for me to hazard an opinion, without the opportunity of more accurate examination of the birds than is at present within our power, and a more accurate knowledge of them than a mere description affords us. It would appear, however, that one group at least, that of *Ibycter*, is sufficiently distinguished from the other *Falconidæ* with the naked cheeks, by the difference of its food and habits. The accounts which have reached Europe of its mild and gentle manners and vegetable food have even induced some naturalists to refer it to the Gallinaceous Birds. I have strong doubts indeed whether the birds that compose this genus may not belong to quite a distinct station from the present, and be referrible to one of those groups which I have elsewhere observed to be wanting among the Birds of Prey, to perfect that chain of affinities which is to be found complete in all the other orders. It is impossible, however, at present, to come to any decision on the subject. While our materials for classification are so scanty, the most that is in our power is to conjecture the place which more perfect information will enable us to assign any group hereafter. For the present we may leave the genus before us in that situation, between the *Vulturidæ* and the *Falconidæ*, which they have hitherto been generally supposed to fill.'

Example, *Daptrius ater*.

Description.—Black with bluish reflections; *tail* white at its base above, and rounded; *beak* and *claws* black; *cere* blackish ash, space round the eyes naked and of a flesh-colour; *feet* yellow. Length from 14 to 15 inches French. This is the *Iribin noir* of Vieillot, and the *Caracara noir, Falco aterrimus*, of Temminck. *Locality*, Brazil and Guiana. M. Lesson notes it as probably a genus for suppression

Head and Foot of Daptrius Ater.

Polyborus. (Vieillot.)



Beak compressed above. Lower *mandible* entire and obtuse; *cere* covered with hairs, large; *cheeks* and *throat* featherless; *crop* woolly. Example, *Polyborus Brasiliensis*, *Polyborus vulgaris*. Vieillot. The *Brazilian Caracara Eagle*.

We select Mr. Bennett's *Description* and general history of this species as the most complete. After giving the generic characters, and observing that the wings nearly equal the tail in length, that they are of a rounded form with the third and fourth quills longest; that the legs are rather long, naked, and reticulated, and the claws of moderate length and curvature, but with little acuteness or power of grasping, the last-named author thus proceeds:—'In the Brazilian Caracara the whole upper surface of the head is black, with the feathers slightly elongated backwards, and capable of being partially elevated in the shape of a pointed crest. The entire neck is of a light brownish gray, which also forms the ground colour on the breast and shoulders, but with the addition on these parts of numerous transverse wavy bars of a deeper brown. Nearly all the rest of the plumage is of a tolerably uniform shade of blackish brown, with the exception of the tail, which is at the base of a dirty white, with numerous narrow, transverse, undulated bands of a dusky hue, and, in its terminal third, black without any appearance of banding. The beak is horn-coloured at the tip and bluish at the base; the iris hazel; the cere and naked cheeks of a dull red; the legs yellow, and the claws black. Such at least are the colours of the living specimen in the Society's garden. Several changes, however, take place in the plumage of the bird as it advances in age, and these are well illustrated by an extensive series of specimens in the Museum in Bruton-street,'—now in Leicester Square. 'So great in fact is the variation of colours in this species that scarcely any two descriptions of it correspond throughout, and the figures by which it has been illustrated differ from each other even more remarkably than the descriptions by which they are accompanied.' (*The Gardens and Menagerie of the Zoological Society delineated*, vol. ii.)

The same author observes that Marcgrave was the first to introduce into Europe the name of Caracara, the vulgar appellation of the bird in Brazil, derived from its hoarse and peculiar cry. But although M. Cuvier regards Marcgrave's Caracara as identical with the species described by Mr. Bennett, the latter remarks that both the figure and description are so much at variance with it that he feels himself compelled to adopt in preference the opinion of Professor Lichtenstein, founded upon the original drawing, that they belong to a totally different bird. Mr. Bennett is consequently unable to trace the history of the true Caracara beyond the year 1784, when a figure and description were published at Vienna by the younger Jacquin, from his father's papers, under the name of *Falco cheriway*. These Mr. Bennett has no hesitation in referring to the present species. The principal differences between them consist, he states, in the markings on the breast and neck, which in the figure are more longitudinal than transverse; and in the very awkward foreshortening of the beak, which completely distorts its natural form. The former appears, from the specimens in the Society's Museum, to be one of the distinctive marks of the young bird. Cuvier, in the last edition of the *Règne Animal*, observes that the *Falco cheriway* of Jacquin may be nothing but a variety of age. Mr. Bennett then notices the very complete description of the adult Caracara in D'Azara. According to this author, the full-grown bird measures 21½ inches in length and 50 in the expanse of the wings. Its colours agree with the description above given, excepting that the first six quill-feathers of the wings are white, marked with rays and spots of brown, and become blackish towards the point; the back is transversely rayed with brown and white, the latter predominating on its upper half, and *vice versâ*; the fore part of the neck and breast are traversed by dusky lines mixed with a larger proportion of white; the cere is of an orange hue; and the throat and sides of the head are almost white. This description, Mr. Bennett remarks, very nearly coincides with that of M. Cuvier, taken from specimens in the Paris Museum, and with the figure of one of these specimens given by M. Vieillot in his 'Galerie des Oiseaux;' and Mr. Bennett then refers to the figure given by M. Spix in his 'Birds of Brazil,' as the young of this species, which resembles M. Vieillot's in its form, except that the legs are longer and thicker, and the tips of the wings reach to the extremity of the tail. In colour it is rather of a darker brown, approaching more nearly to the Society's specimen alluded to by Mr. Bennett; the throat is light brown instead

of white; and the transverse waves of the breast and shoulders are replaced by longitudinal brown dashes upon a light ground. The cere and naked cheeks are in both of a bright yellow; indeed Mr. Bennett states that he has nowhere met with them of the same hue with those of the Society's living specimen, except in the figure and description of Jacquin.

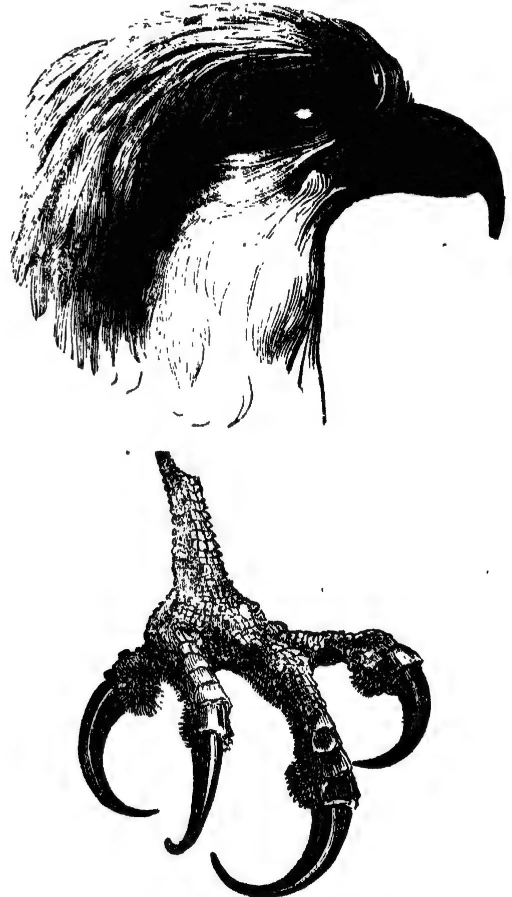
Habits, Food, Reproduction. The *Caracara* is said to live either alone or in pairs. But D'Azara states that he has seen them join in companies of four or five to hunt down prey which a single caracara would find a difficulty in mastering, such as red buzzards, herons, and other large birds, and it is believed that they will even destroy the American ostrich, young fawns, and lambs, when so associated. In its *food* it seems to be content with any animal substance. Carrion (for if a caracara see a vulture devour a piece of flesh he is said to pursue him and compel him to disgorge it), toads, frogs, worms, snails, lizards, grubs, grasshoppers, winged ants, snakes, and flies, birds—in short the general prey of buzzards, hawks, falcons, and insectivorous birds,—all suit its appetite. Two of the specimens obtained by M. Spix were shot in the act of extracting insects from the hides of oxen. D'Azara will not allow that the caracara preys on the smaller birds, because, he says, that it is unable to catch them; but Prince Maximilian found in the stomachs of those which he opened the remains of small birds and insects, especially grasshoppers, which abound in its haunts. It is by no means shy, and advances like the vultures to inhabited places, perching on trees and housetops and not caring to conceal itself. It is seldom attacked, for it rarely molests domestic poultry, but it is stated that it will sometimes carry off the sportsman's game. The *nest*, according to D'Azara, is built on the tops of trees, especially those round which the climbing plants are most luxuriant, or in a bushy thicket. It is large, and composed of sticks and twining branches laid nearly flat, and lined, inartificially, thickly with hairs. The eggs, which are laid in August, September, or October, are two in number, pointed at one end, and dotted and blotched with crimson on a brownish-red ground.

Head and foot of Polyborus Brasiliensis.

Locality. The bird extends over a considerable part of South America; the island of Aruba, on the coast of Venesuela (Jacquin); Brazil and Paraguay (Cuvier); most abundant in the south and east of Brazil (Prince of Neuwied); Spix's specimens were from the northern provinces; less numerous on the Rio de la Plata than in Paraguay, where it is almost equal in number to all the other birds of prey put together (D'Azara); Straits of Magalhaens (Capt. Phillip Parker King, R.N.).

N.B.—There are now (1837) two fine specimens in the garden of the Zoological Society in the Regent's Park.

Mr. Bennett's provisional species *Polyborus* (?) (*hypoleucus*) was founded on the *Angola Vulture* of Pennant, *Vultur Angolensis* of Gmelin, in an immature state of plumage.



Dr. Smith proposed the genus *Polyboroïdes* on the *Falco Gymnogenys* of Temminck in the South African Journal, in April, 1830, and M. Lesson, in the November of that year, separated the same form under the generic title *Gymnogenys*.

From *Ibycter* and *Polyborus* Mr. Vigors passes to the *Fishing Eagles*, and particularizes as the first

Pandion (Savigny).

Beak rounded above. *Cere* hispid. *Nostrils* lunulated and membranaceous on the upper margin. *Tarsi* naked. *Acrotarsia* covered with rigid, reticulated scales. *Toes* free, the external toes versatile. *Claws* equal, rounded underneath. 2d. *quill* longest.

Example, *Pandion Haliætus.*

Head and foot of Pandion Haliætus.

Mr. Vigors is of opinion that this group presents us with a decidedly characteristic difference from all the other species of the family, except those of *Elanus*, in the internal parts of the nails being rounded instead of grooved. The *culmen* of the bill, he observes, is also more broad than usual and much rounded; the toes are entirely separated, and the tarsi are covered with strong, prominent, and thickly reticulated scales. The same author remarks that the well-known *Osprey* of our coasts, *Falco Haliætus* of Linnæus, is the type of the genus to which the valuable researches of Dr. Horsfield in Java have added a second species, *P. Ichthyætus*. In this species, however, which agrees with *Pandion* in the more essential characters, Mr. Vigors finds a strong approximation to the following genus, *Haliæetus*.

Its bill, he adds, is more compressed than that of *Pandion*, its *acrotarsia* are scutellated, and the 4th quill feather, as in *Haliæetus*, is the longest. It thus stands, in the opinion of Mr. Vigors, osculant between the two groups. For the description and natural history of Pandion Haliætus see BALD BUZZARD, vol. iii. p. 316.

The last group of the *Fishing Eagles*, according to Mr. Vigors, is comprised in the genus

Haliæetus (Savigny).

Beak convex above. *Nostrils* lunulated, transverse. *Cere* sub hispid. *Tarsi* semiplumed. *Acrotarsia* scutellated. *Toes* free, the external toe versatile. *Claws* unequal.

Mr. Vigors notices the difference of this form from *Pandion* in the structure of the nails and the more compressed culmen of the bill; in the *tarsi*, also, which have the acrotarsia scutellated and are feathered half way below the knee. There are several species; for instance, *F. leucocephalus*, *F. albicilla*, *F. Pondicerianus*, *F. blagrus*, *F. vocifer*, &c., &c.

Example, *Haliæetus leucocephalus*.

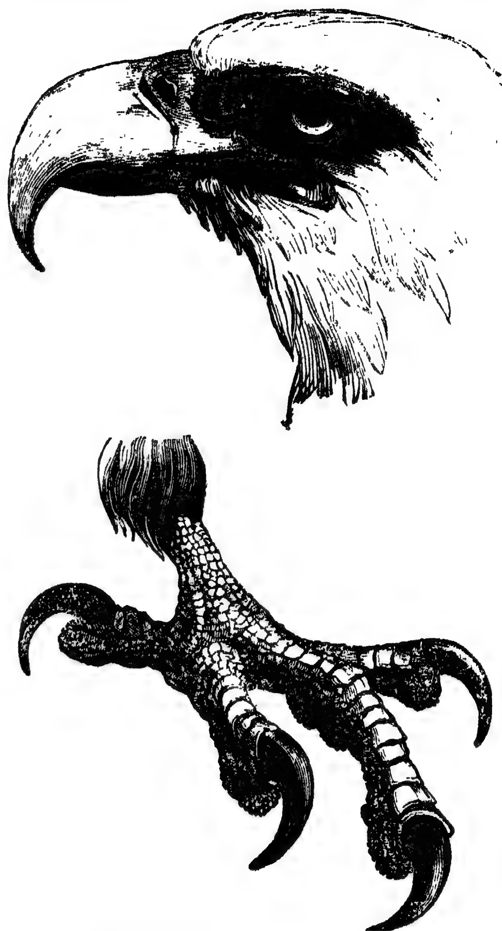
Before we proceed to the description of our example, it may be necessary with Mr. Bennett's assistance to clear up the confusion which, as he observes, has existed in the synonymy of *Haliæetus albicilla*, the difference of the colours of the plumage in the various stages of its growth having induced authors to record it under several distinct names. Three of these were almost universally admitted till about 26 years ago, when the result of M. F. Cuvier's observations on the individuals kept in the Jardin des Plantes led him to unite *Falco ossifragus*, *albicaudus*, and *albicilla* of Gmelin under one name: subsequent inquiry has confirmed this conclusion. In the earlier stages of life the beak of *H. albicilla* is of a bluish horn-colour; its head and neck deep brown; the plumage above, brownish-black mixed with whitish or ash-coloured spots on the back and tail. In this state it is *Falco ossifragus* of systematists. About the third or fourth year the head and neck become ashy-brown; the beak gradually changes from bluish to pale-yellow, the white spots on the back vanish, and the tail becomes uniformly grayish-white. It is now *Falco albicaudus* of Gmelin, *Petit Pygargue* of Buffon, and the *Lesser White-tailed Eagle* of Latham. In its fifth year it is come to maturity, and the change is complete. The head and neck have little of the brown tinge left, the back is throughout of a dusky-brown intermingled with ashy-gray, and the tail is quite white. In this its perfect state it is *Falco albicilla*, the *Grande Pygargue*, the *White-tailed* or *Cinereous Eagle*. In all the stages of this, *The Great Sea Eagle*, which inhabits nearly the whole of Europe and of Northern Asia, the cere and naked parts of the legs are yellow; the under part of the body is of a lighter hue than the upper, and more thickly interspersed with pale cinereous spots; the claws are completely black. (*Gardens and Menagerie of the Zool. Soc. delineated*, vol. ii.)

We now return to *Haliæetus leucocephalus*, the *Sea Eagle*, *Bald Eagle*, *White-headed Eagle*, the symbol of the United States of America.

Mr. Bennett, in the work last quoted, remarks, that in the earlier stages of its growth there is little to distinguish this species from the *Great Sea Eagle*. M. Vieillot, indeed, following the example of Daudin, has united the *White-headed Eagle* to the list of synonyms of the *Great Sea Eagle*. 'That such a union, writes Mr. Bennett, 'is founded upon insufficient data is proved by the gradual development in the bird under consideration of a character which, after a certain age, at once distinguishes it from the remainder of its tribe. This character consists in the pure whiteness of its head and neck, from whence it has derived the popular but inappropriate title of the *Bald Eagle*, by which it is most commonly known.' The young are clothed at first with a thick whitish or cream-coloured cotton-like down, and they become gradually gray as the development of the true plumage goes on. In the third year the white may be traced upon the head, neck, tail-coverts, and tail; and by the end of the fourth year these parts become completely white, or sometimes tinged slightly with cream-colour. The eye, which is at first hazel, changes to a brilliant straw-colour as the head whitens (Wilson). 'This account of the metamorphoses in colour of the white-headed sea eagle,' says Mr. Bennett, 'derived from the personal observations of the accurate author of the *American Ornithology*, has been in a great measure verified under our own inspection in the specimen now before us, which remained for several years in the possession of Mr. Brookes, before it was presented by him to the Society.

'During a considerable part of the time it was regarded as the *Common Sea Eagle*; and it was not until its gradual change of plumage had at length rendered obvious its true character, that it was ascertained to be in reality a distinct species. The same error appears frequently to have existed with regard to it; and M. Temminck observes that the only mark of distinction that can be traced in it until it has assumed the adult colouring, consists in the somewhat greater length of its tail. He might however have added its smaller size, which is probably one-fourth less than that of the preceding bird, at the same age and under similar circumstances. From the observations which we have been enabled to make upon the subject, we should be led to conclude that the period in which it attains its full growth and perfect colouring is, in this country at least and in captivity, two or three years longer than that stated by Wilson. In its immature state, that is to say about the third year, the upper parts of the head and body exhibit a mixture of brown and dirty white, the separate feathers having a ground of the latter colour, and being deeply tipped and broadly barred along the centre with the former. The quill-feathers and primary wing-coverts are black, with their shafts of a pale brown; the secondary are considerably lighter; and the tail, which projects in a trifling degree beyond the extremities of the wings, is brown on the outer quills and of a mixed white and brown on the inner. The under surface, as far backwards as the middle of the belly, is of a much lighter shade than the upper, being of a dull white, with numerous broad streaks of pale brown. In the posterior part it is of a deep brown, the feathers being only slightly margined with white. A similar hue prevails on the upper parts of the legs, which are plumed somewhat below the knees. The beak is of a dusky brown; the cere and legs of a golden yellow; the iris somewhat lighter; and the talons deep blackish-brown. The latter are long, strongly curved, of considerable power, and extremely sharp at the points. The full-grown bird measures upwards of three feet in length from beak to tail, and more than seven in the expanse of its wings. Its beak is changed to a bright yellow; and its head, a greater or less proportion of the neck (according as the bird is more or less advanced in age), and the entire tail, are become perfectly white. An analogous change, as we have before seen, takes place in the plumage of the preceding species; but the head and neck of that bird always retain more or less of a brownish tinge, seldom changing fully into grey, and never turning completely white. These observations have been made upon numerous individuals, many of them placed for upwards of ten years under the eyes of various scientific observers: their accuracy may therefore be regarded as unquestionable. The remainder of the plumage in this state is of a deep brown, approaching to black, and strongly contrasted with the head and tail. The colour of the legs, feet, and talons remains nearly the same; but the iris generally continues to assume a lighter and a lighter hue. The eyes, it should be observed, are deeply sunk in the head, and instead of being placed in a line parallel with that of the cheeks, are directed forwards, so as to form with them a considerable angle.'

Habits, Food, Reproduction.—The reader will find in the article BALD BUZZARD an account of the robberies committed by the *Bald Eagle* on the latter: nor are its acts of plunder confined to that bird, for it will rob the vultures, and even, in hard times, make them disgorge their carrion to satiate its appetite. According to Audubon, it will strike down a swan and other aquatic birds, and now and then procure fish for itself by pursuing them in shallow creeks; it also devours young pigs, lambs, fawns, and putrid flesh of every description. Niagara is one of its favourite haunts, where it watches for the swollen carcasses that the cataract has precipitated down the falls. Wilson saw one seated on a dead horse, keeping a whole flock of vultures at a distance till it had satisfied itself; and, on another occasion, when many thousands of tree-squirrels had been drowned in their migration across the Ohio, and had collected hosts of vultures, the sudden appearance of a *Bald Eagle* sent them all off, and the eagle kept sole possession for many days.



Benjamin Franklin thus speaks of this emblem of the United States of America:—'For my part, I wish the Bald

Eagle had not been chosen as the representative of our country. He is a bird of bad moral character; he does not get his living honestly. You may have seen him perched on some dead tree, where, too lazy to fish for himself, he watches the labours of the fishing-hawk; and when that diligent bird has at length taken a fish, and is bearing it to his nest for the support of his mate and young ones, the Bald Eagle pursues him and takes it from him. With all this injustice, he is never in good case, but, like those among men who live by sharping and robbing, he is generally poor, and often very lousy. Besides, he is a rank coward: the little King-Bird, not bigger than a sparrow, attacks him boldly, and drives him out of the district. He is therefore by no means a proper emblem for the brave and honest Cincinnati of America, who have driven all the *King Birds* from our country; though exactly fit for that order of knights which the French call *Chevaliers d'Industrie*.'

With regard to the *Reproduction*, M. Audubon says that incubation commences in the beginning of January. He shot a female on the 17th of that month, as she sat on her eggs, in which the chicks had made great progress. 'The nest,' says that author, 'which in some instances is of great size, is usually placed on a very tall tree, destitute of branches to a considerable height, but by no means always a dead one. It is never seen on rocks. It is composed of sticks from three to five feet in length, large pieces of turf, rank weeds, and Spanish moss in abundance, whenever that substance happens to be near. When finished, it measures from five to six feet in diameter, and so great is the accumulation of materials, that it sometimes measures the same in depth, it being occupied for a great number of years in succession, and receiving some augmentation each season. When placed in a naked tree, between the forks of the branches, it is conspicuously seen at a great distance. The eggs, which are from two to four, more commonly two or three, are of a dull white colour, and equally rounded at both ends, some of them being occasionally granulated. Incubation lasts for more than three weeks, but I have not been able to ascertain its precise duration, as I have observed the female on different occasions sit for a few days in the nest before laying the first egg. Of this I assured myself by climbing to the nest every day in succession, during her temporary absence.' (*Ornithological Biography*, vol i.)

Locality.—In every part of the United States of America, seldom appearing, according to Audubon, in very mountainous districts, but preferring the low lands of the sea-shores, those of the larger lakes, and the borders of rivers. Mr. Bennett remarks, that the *White-headed Eagle* is usually spoken of as inhabiting the northern parts both of the old and new continent; but that it appears to be only a rare and occasional visitant of the former. It is probable, he adds, that some of the varieties of the *Common Sea-Eagle* of this quarter of the globe have been frequently mistaken for it, and remarks, that throughout nearly the whole of North America, on the contrary, where the European species seems to be unknown, it is met with in great abundance. Dr. Richardson says that it is the earliest of the summer visitors to the fur countries, and the period of its arrival has given the name of *Meekeeshew espeeshim*, or Eagle Moon, to the month of March. 'Temminck,' says Dr. Richardson (*Fauna Boreali-Americana*), 'assigns for its habitual residence the regions within the Arctic Circle; and Wilson observes, that it is found at all seasons in the countries it inhabits. Both these assertions however require, I apprehend, to be taken with considerable latitude. We did not, on the late expeditions, meet with it to the north of the Great Slave Lake (62° N. lat.), although it is common in the summer, in the country extending from thence to Lake Superior, and its breeding-places in the latter district are numerous. But in the month of October, when the rivers from which it draws its principal supply of food are frozen over, it entirely quits the Hudson's Bay lands; and if, after that period, it is to be seen in the northern regions, it can only be on the sea-coast, and for a limited time, while the sea continues unfrozen. . . . It is known to breed as far south as Virginia, but its nests do not appear to be so common within any part of the United States as they are in the fur countries.' The bird is not mentioned in the Supplement to Captain (now Sir W. E.) Parry's First Voyage, nor in that to Captain (now Sir John) Ross's Last Voyage.

This bird is the *Meekeeshew* (name for the species), *Wapustiquan-Meekeeshew* (White-headed Eagle—mature bird), *Appisk-Meekeeshew* (Black-headed Eagle—immature bird), and *Meekeeseeseesh* (Yearling birds) of the Cree Indians.

Head and foot of Haliæetus leucocephalus.

Colonel Sykes notes among the birds of Dukhun (Deccan) *Haliæetus Ponticerianus*, *Falco Ponticerianus* of Latham, *Brahminy Kite* of the Europeans in India. The Colonel says that it is seen constantly passing up and down rivers at a considerable height, but prepared to fall at an instant on its prey. Usually it seizes while on the wing, but occasionally dips entirely under water, appearing to rise again with difficulty. It is quite a mistake, he adds, to suppose it feeds on carrion. On the examination of the stomach and craw of many specimens, the contents were found to be fish, and fish only, excepting on one occasion, when a crab was met with. (*Zool. Proc.*, April, 1832.)

There is a beautiful specimen of *Haliæetus Aguia*, *Chilian Sea-eagle*, now (1837) in the gardens of the Zoological Society, in the Regent's Park; and there is a specimen of *Haliæetus vocifer*, the *Fishing Eagle* of the Cape colonists, in the South African Museum, now (1837) exhibiting in the Egyptian Hall, Piccadilly. The last bird is only met with in the neighbourhood of the sea, or upon the banks of large rivers. See the interesting Catalogue, where it is also stated that *Aquila vulturina*, also in the Museum, resorts exclusively to high rugged mountains, where it preys upon the *Hyrax Capensis*—the *Dassie* of the Cape colonists. Dr. Smith (*Zool. Proc.*, April, 1833) had previously stated that *Aquila Verrauxii* of Lesson is synonymous with *Aquila vulturina*, which had recently been described by M. Lesson as a *Haliæetus*, but that it has however none of the habits of the *Fishing Eagles*, inhabiting the highest and most rocky mountains, preying principally upon the animal mentioned in the Catalogue. In the 'Proceedings' it is added that the error probably arose from the white back being concealed, in stuffed specimens, by the wings.

Leaving the *Fishing Eagles*, Mr. Vigors proceeds to

Circæetus. (Vieillot.)

Beak convex above. *Nostrils* lunulate, transverse *Cere* subhispid. *Tarsi* elongated, naked. *Acrotarsia* re-

ticulated. *Toes* short, the external toe connected with the middle one at the base. *Claws* short, subequal. This genus is founded upon the well-known *Jean le Blanc* of the European continent, *Falco brachydactylus* of Wolff, *Falco Gallicus* of Gmelin, *Aquilotto* of the Italians. Here, Mr. Vigors observes, we find the exterior toe united to the middle by a short membrane, which is the case indeed in the greater portion of the family, while in the two latter genera the toes are all divided to the origin.

Description.—Circaëtus brachydactylus is, according to Temminck, the *Falco brachydactylus* of Wolff; *Aquila brachydactyla* of Meyer; *Falco Gallicus* of Gmelin; *Falco leucopsis* of Bechstein; *Aquila leucamphoma, Borkh. Deut. Orn.; Le Jean le Blanc* of Buffon and the French generally; *Aigle Jean le Blanc* of Temminck; *Falco Terzo d' Aquila*, Stor. deg. Ucc.; and *Kurzzehiger-Adler* of Meyer.

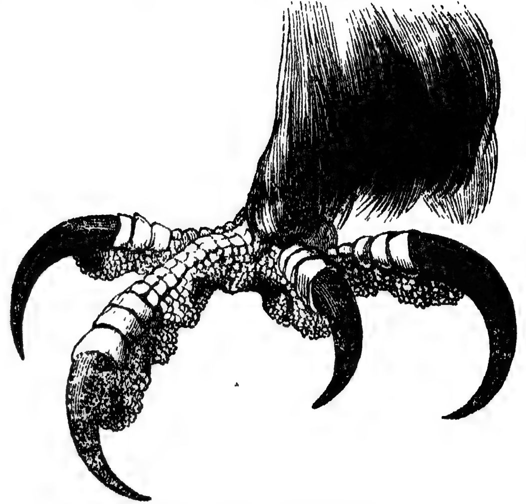
Old Male.—Head very large; below the eyes a space clothed with white down; summit of the head, cheeks, throat, breast, and belly, white, but variegated with a few spots of bright brown; *back* and *coverts* of the wings brown, but the origin of all the feathers of a pure white; *tail* square, gray-brown, barred with deeper brown, white below; *tarsi* long and grayish-blue, as are the *toes; beak* black; *cere* bluish; *iris* yellow; length, two feet.

Female.—Less white than the male. The *head*, the *neck*, the *breast*, and the *belly*, are marked with numerous brown spots, which are very much approximated.

Young.—Upper parts darker, but the origin of the feathers pure white; *throat, breast*, and *belly*, of a red-brown, little or not at all spotted with white; bands on the *tail* nearly imperceptible; *beak* bluish; *feet* greyish-white.

Food and *Reproduction.*—Lizards and serpents, to which it gives the preference; rarely birds and domestic poultry. The *nest* is built on the highest trees, and the eggs are two or three in number, of a lustrous grey, and spotless.

Head and foot of Circaëtus brachydactylus.



Locality.—The great fir forests of the eastern parts of the north of Europe; not common in Germany and Switserland; rare in France; never seen in Holland. (Temminck.) Prince Bonaparte notes it as rather rare near Rome. Colonel Sykes notes it among the birds of the Dukhun (Deccan)

Dr. Smith's *Circaëtus pectoralis*, which undergoes many changes of plumage before it arrives at maturity (see South African Museum and Catalogue), is stated (*Zool. Proc.*, April, 1833) to be synonymous with *Circ. thoracinus* of Cuvier.

Mr. Vigors next proceeds to the true

Aquila (of Authors).

Beak subangular above. *Nostrils* rounded. *Cere* subhispid. *Tarsi* plumed to the toes.

Leg and foot of Golden Eagle.

Mr. Vigors observes that the predominant mark of distinction in this genus is the *tarsi* being feathered to the toes. The *culmen* of the bill appears also to differ from that of the other *eagles* in being more angular. The species *Aquila heliaca* of Savigny, *Falco chrysaetos*, and *Falco nævius* of Linnæus, *Falco bellicosus* of Daudin, with some others lately made known to us, belong to the group which contains the most powerful birds of the family.

Example, *Aquila chrysaetos, the Golden Eagle, Adler* of the Germans, *Eryr Melyn* of the antient British.

Aquila chrysaetos

Description.—*Old birds.*—Summit of the *head* and nape with acuminated feathers of a lively and golden-red; all the other parts of the *body* obscure brown, more or less blackish according to the age of the individual; inside of the *thighs* and feathers of the *tarsus* clear brown; *never any white feathers among the scapulars;* tail deep grey, barred with tolerable regularity with blackish-brown, and terminated at the end by a large band of that colour; *beak* horn-colour; *iris* always brown; *cere* and *feet* yellow. In this state Temminck considers it to be the *Aquila fulva* of Meyer; *Falco niger* of Gmelin; *Falco fulvus* and *Falco Canadensis* of Gmelin; *Falco chrysaetos* of Linnæus; *L'Aigle Royal* of Buffon; *Le Grand Aigle*, Gerard, *Tab. Elem.; L'Aigle Commun* and *L'Aigle Royal* of Cuvier; *Ringtail* and *Golden Eagle* of Latham; and *Aquila Reale di Color leonato* and *Aquila Rapace*, Stor. deg. Ucc.

Young birds of one and two years. (Ring-tail Eagle.) All the plumage of a ferruginous or clear reddish-brown, uniform on all parts of the *body:* lower *tail coverts* whitish; inside of the *thighs* and feathers of the *tarsus* of a pure white; *tail* quite white from the base to three-fourths of its length, but afterwards brown to the end; internal barbs of the *quills* and of the *caudal feathers* pure white: this same colour occupies also the greatest part of all the feathers of the body from their base. In proportion as the young bird advances in age the colours of the plumage become brown, the white of the tail occupies less space, and traces of the transverse bars appear. In the third year the young bird puts on his adult plumage.

Varieties.—Partially or totally white. (*Falco albus* of Gmelin; *Falco cygneus* of Latham; *L'Aigle Blanc* of Brisson.)

Food and *Reproduction.*—The Golden Eagle preys on lambs, fawns, &c., and often on large birds. Extreme hunger will drive it to prey on carcasses.

Locality.—The great forests in plains, and in a less degree those in the mountains of the north of Europe; very common in Sweden, in Scotland, in the Tyrol, Franconia, and Suabia; more rare in Italy and Switzerland; rather common in France, in the forest of Fontainebleau, in the mountains of Auvergne, and on the Pyrenees; rare in Holland; less common in the Oriental countries than the preceding species, *i.e. Aquila heliaca* of Savigny, *Aquila imperialis* of Temminck. (Temminck.) According to Wilson, the Golden Eagle inhabits America, and occurs from the temperate to the arctic regions, particularly in the latter, where it *breeds* on precipitous rocks, always preferring a mountainous country. Dr. Richardson (*Fauna Boreali-Americana*) mentions it with a query as breeding in the recesses of the sub-alpine country which skirts the Rocky Mountains, and as seldom seen farther to the eastward. 'It is,' says Dr. Richardson, 'held by the aborigines of America, as it is by almost every other people, to be an emblem of might and courage, and the young Indian warrior glories in his eagle plume as the most honourable ornament with which he can adorn himself. Its feathers are attached to the calumets, or smoking pipes, used by the Indians in the celebration of their solemn festivals, which has obtained for it the name of the Calumet Eagle. Indeed, so highly are these ornaments prized, that a warrior will often exchange a valuable horse for the tail feathers of a single eagle.' It is the *Keoo* of the Cree Indians. Dr. Richardson observes that the mature British Golden Eagle has a darkish-brown tail and wings, blackish-brown back, clouded with brownish-black, and a paler and brighter-brown head. He had not seen an American one in this state, but we do not think that any reason for a doubt. Many other authors mention the eagle and ring-tails in such terms as to leave the identity of the bird almost unquestionable; and though Dr. Richardson says that it is seldom seen farther to the eastward than the Rocky Mountains, M. Audubon relates that he saw a Golden Eagle on the coast of Labrador, besides others in various parts of the United States. It inhabits Russia, Iceland, and Germany, and is said to occur in Northern Africa and Asia Minor. Mr. Yarrell, in his interesting History of British Birds, now in the course of publication, thus sums up its localities in our islands. 'The Golden Eagle, though occasionally seen, and sometimes obtained, in the southern counties of England, is more exclusively confined to Scotland, and its western and northern islands. Some years ago a specimen was killed at Bexhill, in Sussex it has also occurred, but very rarely, in Suffolk, Norfolk, Derbyshire, Durham, and Northumberland. Mr. Mudie, in his 'Feathered Tribes' of the British Islands,' has named 'the higher glens of the rivers that rise on the south-east of the Grampians, the high cliff called Wallace's Craig, on the northern side of Lochlee, and Craig Muskeldie on its south side,'' as localities for the Golden Eagle. Mr. Selby and his party of naturalists observed this species in Sutherlandshire in the summer of 1834. Mr. Macgillivray, in his detailed descriptions of the rapacious birds of Great Britain, has recorded his own observations of this species in the Hebrides; and other observers have seen it in the Orkney and Shetland Islands, where it is said constantly to rear its young. In a direction west of London the Golden Eagle has been obtained or seen on the coasts of Devonshire and Cornwall. In Ireland, a Ring-tailed Eagle (the young of the Golden) was seen by a party of naturalists in Connamara in the autumn of 1835; and from William Thompson, Esq., vice-president of the Natural History Society of Belfast, to whom I am indebted for a catalogue and notes of the birds of Ireland, which will be constantly referred to throughout the work, I learn that specimens of the Golden Eagle are preserved in Belfast which were obtained in the counties of Donegal and Antrim.' The age of the eagle is almost proverbial. One that died at Vienna is said to have lived in confinement 104 years. Colonel Sykes notes the Golden Eagle among the birds of the Dukhun (Deccan). His specimen differed so slightly from the European bird as not to justify its separation. (*Zool. Proc.*, April, 1832.)

In the catalogue of birds collected on the Ganges between Calcutta and Benares, and in the Vindhyian hills between the latter place and Gurrah Mundela, on the Nerbudda, by Major James Franklin, F.R.S., &c., we find recorded an eagle, *Aquila Vindhiana*, with a query whether it is the *Cawnpoor Eagle* of Latham (*Zool. Proc.*, August, 1831), and among the Dukhun birds, *Aquila bifasciata* of Hardwicke and Gray. (*Ind. Zool.*) A whole rat was found in the stomach of one bird. A second was shot by Colonel Sykes at the dead carcass of a royal tiger, but it had not fed, for the stomach was empty. Dr. Smith stated (*Zool. Proc.*, 1833) that the eagle from the Cape presented to the Society by the Hon. J. T. Leslie Melville, and in the Society's menagerie, was not the young of *Aquila vulturina* (Daudin), but of *Aquila Choka* (Smith), *Falco rapax* (Temminck). Specimens of *Aquila bellicosa* and *rapax* are in the South African Museum, as well as of *A. vulturina*. The first is only found in wooded districts, preys upon small quadrupeds, and has been known to pounce upon small antelopes, and carry them off entire to its nest. *A. rapax*, though it principally preys on living creatures, does not wholly reject carrion, being frequently one of the first birds that approaches a dead animal. (See Catalogue of South African Museum.) Mr. Keith Abbott (*Zool. Proc.*, June, 1834) notes among the Trebizond birds *Aquila pennata*, inhabiting Eastern Europe and the adjacent parts of Asia and Africa.

Hæmatornis. (Vigors.)

Mr. Vigors, at a meeting of the Zoological Society (December, 1831), characterized among the species comprising the 'Century of Birds from the Himalaya Mountains,' drawn and lithographed by Mr. and Mrs. Gould, the above-named genus, which Mr. Vigors considered as exhibiting a striking diversity of form among the *Eagles*.

Generic Character.—*Beak* rather strong, sufficiently elongated; upper *mandible* straight at the base, very much curved at the apex; *nostrils* oval, placed obliquely in the *cere*. *Wings* long, subrounded; the first *quill* rather short, the second and third longer, the fourth and fifth nearly equal and longest, the rest gradually decreasing. *Feet* rather weak, subelongated; *tarsi* rough, reticulated with scales; *toes* rather short, reticulated; *claws* strong. *Tail* sufficiently long, somewhat rounded. (Vigors.)

This group was observed to bear a near affinity to the genus *Pandion* in the shape of the bill, wings, and the rugose reticulated scales of the *tarsi*, but to differ from it in the comparative length and weakness of the legs and claws, as well as in having the nails grooved underneath, and not convex as in the latter group. To this genus belongs the *Falco Bacha* (Latham) of Africa, and the Manilla bird then lately described in the Proceedings (page 96), under the name of *Buteo holospilus*. These, from the ap-

parent weakness of their limbs, had hitherto generally been ranked among the buzzards; although from the description of the courageous habits of the *Bacha Falcon*, the only one well known of the group, doubts had been expressed of the propriety of ranking them with that tribe. Mr. Vigors suggested the subfamily of *Eagles* as a more appropriate station for them; where, united by many important characters to *Pandion*, they apparently led off by the length of their *tarsi* to the genus *Limnaëtus* ('Memoirs of Sir S. Raffles,' Append., p. 648) and others of the long-legged *Eagles*. The three species of the group were exhibited, their general similarity in colour and markings pointed out, and their specific differences explained. These consist chiefly in size, *Hæmat. holospilus* being one-third smaller than *H. Bacha;* while *H. undulatus* (which is 2 feet 7 inches in length) considerably exceeds the latter. The first is spotted all over the body, the second only on the abdomen, while the third is marked by spots on the wing-coverts, and by *ocelli* bearing an undulated appearance upon the abdomen, the breast also being crossed by undulating *fasciæ*. A specimen of *H. undulatus* was afterwards (January, 1832) exhibited from Mr. Hodgson's Nepaul collection. It agreed accurately with that which had been previously exhibited, except in size; the present specimen being about one-third longer. From this difference in size it was conjectured to be a female. Colonel Sykes identified a specimen shot in the Dukhun (Deccan) with *Hæmatornis Bacha*. (Zool. Proc.)

Description of *H. undulatus* (male and female probably). *Back* and *wings* intense brown; *head* crested, the feathers white at the base, of a dark brown, nearly approaching to black at the end, the hind ones being margined with a light rufous band at the apex. The *wing-coverts* near the carpal joint deep brown, marked with small white spots; *quill-feathers* fuscous, darker at the apex, and marked with white towards the base of the interior web; the *cere*, base of the *beak*, and *legs*, yellow; *claws* black. (Vigors, in Gould's 'Century of Birds from the Himalaya Mountains.')

Hæmatornis undulatus, from the work above quoted, by permission.

* *

Short-winged Eagles.

Harpyia. (Cuvier.)

Beak, above, convex. Upper *mandible* slightly toothed. *Nostrils* semilunar, transverse. *Tarsi* elongated, very strong, feathered at the base. *Acrotarsia* scutellated. *Claws* long, very strong, acute.

Mr. Vigors, in placing *Harpyia* next to *Aquila*, observes that the former equals the latter in size and powers of body. Its *tarsi*, he remarks, are strong, thick, partly plumed, with scutellated *acrotarsia*. The *nares* are elongated, apparently semilunar, and placed transversely on the *cere*. The upper mandible, he adds, seems to have a notch somewhat analogous to that of the true *Falcons*. The type is *Falco imperialis* of Shaw.

This powerful bird is the *Grande Harpie d'Amerique* of the French, *Aquila coronada* of the Spanish, *Falco destructor* of Daudin, *Aigle destructeur* of Sonnini, *Grand Aigle de la Guiane* of Mauduyt, *Harpyia destructor* of Cuvier. Mr. Vigors states with truth that much confusion has arisen as to the synonyms of this bird, and even as to the characters of the genus. Mr. Bennett has, in our opinion, well cleared this confusion away, and we therefore select his synonymy.

'M. Temminck,' says the last-mentioned zoologist (*Gardens and Menagerie of the Zoological Society delineated*, vol. ii.), 'the latest writer on this magnificent bird, positively denies its identity with the *Vultur harpyia* of Linnæus, and the crowned eagle (*Vultur coronatus*) of Jacquin, on the singular ground that those names indicate a smaller bird with longer and more slender legs. Now Linnæus, who borrowed his original description of the harpy from Hernandez, asserts, on the authority of that writer, that it is equal in size to a common ram; and Jacquin states his bird to have measured full two feet and a half in height in its natural sitting posture, and almost two inches in the diameter of its legs. It is impossible to read the descriptions of Hernandez and Jacquin, making in the case of the former some little allowance for exaggeration, without feeling a conviction that they both refer to the bird now under consideration. That of the latter author in particular is admirably characteristic. Linnæus originally founded his species on the indication given by Hernandez in the tenth edition of his 'System' he suggested a comparison between it and a bird seen by a friend, probably a pupil, in the Royal Menagerie at Madrid, which there is every reason to believe, from the description given, to have been just. It was only in the twelfth edition of his immortal work that he introduced a slight confusion by adding to the citation from Hernandez, to the account furnished by his friend, and to some particulars extracted from Jacquin's then unpublished description of his supposed species, a synonym from Marcgrave, which can alone justify M. Temminck's criticism. We restore without hesitation both these synonyms of Linnæus and Jacquin, excluding only from the twelfth edition of the *Systema Naturæ* the references to Marcgrave and his copyists. With the *Vultur harpyia* of Linnæus and the *Vultur coronatus* of Jacquin are necessarily included among the synonyms of the Harpy eagle the *Falco harpyia* and the *Falco Jacquini* of Gmelin, by whom the trivial name assigned by Jacquin to his bird was changed on account of its introduction into a genus in which that appellation was pre-occupied. In the year 1778, Mr. Dillon observed, in the Menagerie of Buen Retiro at Madrid, a species of eagle, which he imagined to be 'an undescript kind not taken notice of by Linnæus.' This bird, which he figures in his Travels through Spain under the name of the *Crested Falcon*, is evidently of the same species with the harpy, although the representation is rudely executed, and in some respects, as for example the length of the beak, grossly caricatured. We might almost be tempted to suspect that the specimen seen by him was identical with that described by Linnæus from the same menagerie twenty years before, were it not that the latter bird is expressly called Mexican, while that of Mr. Dillon is stated to have come from the Caracas. For this reason Dr. Latham introduced it into his Synopsis under the name of the *Caracca Falcon*.

'Gmelin, quoting from Latham, soon after latinized its former name into *Falco cristatus*, and this may therefore be added to the synonyms of our bird, of which Mr. Dillon's was the first published figure. The next original describer of the Harpy Eagle was Mauduyt, who also regarded his specimens as nondescript, and gave them the name of *Grand Aigle de la Guiane*, from the country whence they were obtained. To these birds, which formed part of the collection of the Paris Museum, Daudin, in his Ornithology, published in 1800, applied the scientific appellation of *Falco destructor;* and the names given by these two writers have been generally adopted on the continent of Europe as the only ones certainly applicable to the species. M. Sonnini seems doubtful whether or not to regard the two specimens described by him as distinct species, and names the one *Aigle destructeur*, and the

other *Grand Aigle de la Guiane*; but there seems no sufficient reason for their separation. Dr. Shaw's *Falco imperialis* is founded on this indication of Sonnini. In all probability the *Crested Eagle* of Stedman's 'Expedition to Surinam,' spoken of as a very strong and fierce bird, belongs to the same species. Figures of the harpy are likewise given by M. Cuvier in his 'Règne Animal,' by M. Vieillot, in the second edition of the 'Nouveau Dictionnaire des Sciences;' and by M. Temminck, in his 'Planches Coloriées.' Those of the two last-named works are strikingly characteristic. That of the 'Dictionnaire' exhibits the crest-feathers equally and stiffly elevated round the back part of the head, a state in which we have never seen them in our bird, and which, on account of their laxity, and the lower position of the middle ones, we doubt their power to assume. It is right however to remark, that the crest is stated by Linnæus and other authors to possess this power of elevation round the head in form of a crown, an ornament alluded to in the Spanish name of the bird, *Aquila coronada*, and in the trivial appellation, *coronatus*, affixed to the species by Jacquin. We believe that we have now restored to this bird all the original synonyms which unquestionably belong to it. The original descriptions of Hernandez, Linnæus, Jacquin, Mauduyt, Daudin, and Sonnini, and the figures of Dillon, Shaw, Cuvier, Vieillot, and Temminck, are such as leave no doubt upon our minds of the accuracy of the references to those authors. We have purposely abstained from mentioning others which have been occasionally quoted, but which either do not appear to us to be satisfactorily determined, or are evidently founded on mistake. Of the former class, the *Ouyra-Ouassou* of Lery, or Royal Bird of Prey of Brazil, may serve as an example; of the latter, the *Calquin* and *Tharu* of Molina.'

Description (adult).—*Head* with thick downy plumage, of a light slaty-gray. *Crest* arising from the back part, of numerous broad feathers increasing in length towards the middle line of the head, and thus assuming a rounded form, of a dull black, with the exception of a slight margin of gray on the tips of the longer feathers, and a more extensive tinge of the same colour on those of the sides. This crest is slightly raised above the level of the feathers of the back of the neck when the bird is quiet, but is capable of being elevated at right angles with them upon any sudden excitement. In this state, to an observer placed in front of the bird, the middle feathers of the crest are rarely visible, on account of their being inserted much lower down than the lateral ones; while the latter, converging on either side, form, as it were, two lax ear-like processes. Below the crest, the whole of the *back* and *wings*, together with a *broad collar* round the fore part of the *neck* black, each of the feathers of the back terminating in a narrow transverse somewhat lighter streak. *Under surface*, from the breast backwards, pure white; plumage of the legs white with blackish transverse bars. *Tail* with four transverse black bands, of about equal breadth with the four alternating whitish or ash-coloured spaces; the tip light ash. (Bennett.)

Immature bird.—*Upper parts* mottled with brown gray and whitish; *cheeks, occiput, throat,* and *under parts* light gray, with a few black feathers in front of the *neck*, and some large irregular black spots on each side of the lower surface of the *tail-feathers* on a light ash-coloured ground. (*Falco imperialis*, Shaw); (Vieillot, young female?). *Back* and *wings* grayish fawn-colour, irregularly marbled and spotted with black; *collar* ashy-fawn, more or less spotted with black; bars crossing the *legs* fewer and more irregular; all the *lower parts* whitish-fawn sprinkled with darker spots; upper surface of *tail* ash-coloured, with small blackish spots; patches of black mark the places of the future bands which gradually increase at each change; under surface whitish, dotted with fawn. (Temminck.)

(Bird further advanced.) *Collar, crest, back,* and wing-coverts almost uniformly gray; *quill-feathers* of the wings black; *under surface* of body dirty white; each of the *tail-feathers* marked beneath by four large black patches crossing its shaft and occupying about half its width. (Bennett.)

Upper mandible very thick at the base, straight for some distance, and suddenly curving downwards with a strong arch towards the sharp point; *lower mandible* straight, short and blunt; *nostrils* transverse and oval; *wings* when closed not reaching beyond the middle of the *tail*, which is rounded at the extremity; *legs* feathered on the upper part of their anterior surface only, the rest naked and reticulated; *talons* extremely strong, internal and posterior ones very long. Mr. Bennett observes that in some of these characters, as for instance the nakedness of the legs, the harpy approaches the sea-eagles; but it differs from them in many essential points, and in none more remarkably than in the shortness of its wings, and the robustness of its legs and talons; the former character rendering it, like the short-winged hawks, more adapted for preying near the surface of the ground on gallinaceous birds and quadrupeds, and the latter enabling it to carry off a prey of much greater magnitude.

Habits.—The harpy is stated to be a solitary bird, frequenting the thickest forests, where it feeds upon the *sloths*. It also preys on fawns and other young quadrupeds. Sonnini observed it sitting motionless and uttering no cry, on a high tree on the banks of the Orapu. Hernandez does not seem inclined to detract from the powers of the bird, for he says that it will attack the most fierce beasts, and even man himself; and he further states that it may be trained like a hawk to pursue game. Linnæus gives the bird credit for strength sufficient to split a man's skull with a single blow (unico ictu). These accounts of its prowess must be taken with some grains of allowance, but that the bird is very powerful is without doubt. Jacquin's specimen was found dead in the ship that was conveying it to Europe, and its death was with some probability attributed to the sailors, whose monkeys the eagle had destroyed. When these animals gambolled too near its cage they were seized by its talons and devoured with almost all their bones, but not their skin, which the bird invariably stripped off. The harpy which was obtained by Mr. Hesketh, consul at Maranham, near the mouth of the river Amazon, and brought to England by Captain (now Major) Sabine, by whom it was presented to the Horticultural Society, which transferred it to the Zoological Society, in whose collection at the Regent's Park it now (1837) is, is said to have destroyed and eaten a king of the vultures (*Sarcoramphus Papa*) while on its passage to England. After its arrival a cat was put into its cage, and the eagle, with one blow of its immense foot, broke its back.

Localities.—Mexico (Hernandez, Linnæus, and others); neighbourhood of the river Magdalena, in New Granada (Jacquin); Caracas (Madrid specimen): Guiana (Sonnini)

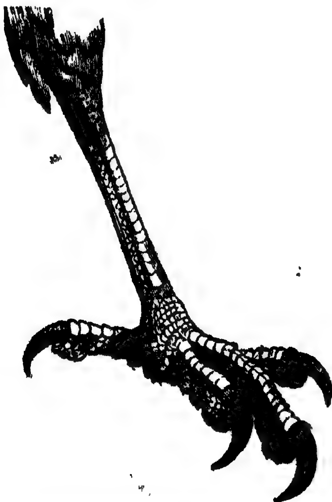
Harpyia Destructor.

Morphnus (Cuvier.)

Beak convex above; *nostrils* elliptical; *tarsi* elevated, rather slender; *acrotarsia* scutellated; *toes* rather short; *claws* acute.

Mr. Vigors observes, that this genus differs from *Harpyia* in its more slender, lengthened, and scutellated *tarsi*, and the comparative weakness of its toes. It is separated into two sections, as the *tarsi* are plumed or otherwise; among the former M. Cuvier arranges *Falcones occipitalis, ornatus*, and *albescens* of Daudin, and *F. maculosa* of Vieillot; among the latter, *F. Guianensis* of Daudin, and *F. Urubitinga* of Gmelin. *Spizaëtus* of Vieillot corresponds with this group.

*

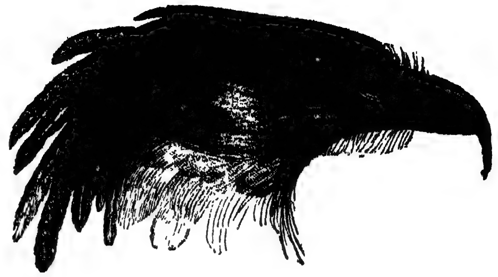


Tarsi naked.

Example, *Morphnus Urubitinga, Falco Urubitinga* of Gmelin, *Aquila Brasiliensis* of Brisson, *Brasilian Eagle* of Latham, *Urubitinga* of Marcgrave, Willughby, Ray, and others. The following is Willughby's

Description.—This bird is like an eagle of the bigness of a goose of six months old. It hath a thick hooked black beak; a yellowish skin (cere) about the nostrils; great sparkling aquiline eyes; a great head; yellow legs and feet; four toes in each foot, disposed after the usual manner; crooked, long, black talons; large wings; a broad tail. It is all over covered with dusky and blackish feathers; yet the wings are waved with ash-colour. The tail is nine inches long, white for six, the end for three inches being black; howbeit in the very tip there is again a little white.

Young of the year.—Blackish yellow below; the centre of each feather marked with blackish brown tear-like spots; throat and cheeks with brown striæ on a whitish ground. Locality, Brazil and Guiana, where it is said to seek its prey on inundated places



Head and foot of Morphnus Urubitinga.

* *

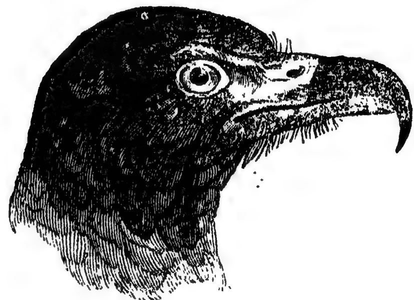
Tarsi feathered.

Example.—*Morphnus occipitalis, Falco occipitalis* of Daudin, *L'Aigle-autour noir huppé d'Afrique*, and *Huppart*.

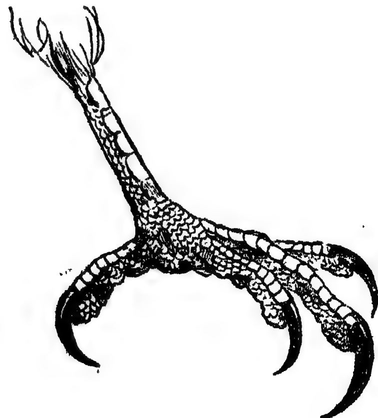
Description.—Size of a crow; black, with a long crest or tuft dependant from the occiput; tarsi, edge of the wing, and bands on the tail, whitish. Locality, Africa.

Head and foot of Morphnus occipitalis.

Cymindis (Cuvier).



Beak convex above; *nostrils* nearly closed, rimiform; *tarsi* short, semipalmated.



Distinguished by their short, half-plumed, and reticulated *tarsi*, and more particularly by their nostrils being nearly closed, and bearing the appearance of a narrow slit or channel.

*

Acrotarsia scutellated.

Example.—*Cymindis hamatus Falco hamatus* of Illiger.

Head and foot of Cymindis hamatus.

Description.—(Adult) upper mandible extremely hooked; *cere* and *feet* yellow; all the plumage uniform lead colour. Length 15 inches 6 lines (French).

Young of the year.—Plumage sombre brown, each feather bordered and blotched with red; summit of the *head* and *cheeks* marked with yellowish elongated spots; a yellowish band below the eyes; front of the neck whitish. Locality, Brazil.

* *

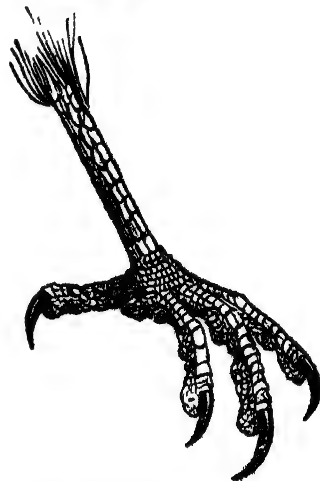
Acrotarsia reticulated.

Example, *Cymindis Cayennensis*, *Falco Cayennensis* of Gmelin, *Petit autour de Cayenne.*

Description.—Summit of the *head* ash-coloured; *back* (manteau) brown, barred with deeper brown; *belly* white; *tail* grey, barred with white beneath; *feet* ash-coloured. Locality, Cayenne.

Head and foot of Cymindis Cayennensis.

Asturina (Vieillot).



Beak convex above; *nostrils* lunulate; *tarsi* short, somewhat slender; *claws* long, very acute.

Example, *Asturina cinerea.*

Description.—Bluish ash-colour; whitish bands on the under part of the body; *tail* traversed by two black stripes, white at the point; *beak* blue below; *cere* blue; *feet* yellow. *Locality*, Guiana.

Mr. Vigors observes, that it is among these *short-winged Eagles* that the greatest difficulty prevails in deciding on their immediate affinities. Being for the most part extra-European, and not within the reach of general examination, their manners also being but little noted, and the characters on which we depend for forming our decision respecting their affinities being for the most part passed over in the descriptions given of them, it is only by conjecture that we can assign them a place in the general arrangement. Of this nature, he remarks, is the genus last described. The same difficulty, he adds, extends to several other described species of the *Falconidæ*, which appear to him to belong to the group of *short-winged Eagles*, although they have been assigned a different locality by the authors who have described them. Among these is the *Falco Bacha* of Daudin, which has been generally ranked with the *Buzzards*. Its short wings and lengthened bill, however, seem, according to Mr. Vigors, to bring it among the present group of the *Eagles*; and its habits, as described to him by Dr. Horsfield, who had an opportunity of closely observing them in the Island of Java, where the birds are by no means uncommon, do not in any respect correspond with the *Buzzard* tribe. Mr. Vigors would place it, together with *F. albidus* of Cuvier, near those species of the genus *Cymindis* which are distinguished by

Head and foot of Asturina cinerea.

the reticulated *acrotarsia*, if not in that genus itself. He has, indeed, some doubts whether most of the short-winged *Falconidæ* at present placed among the *Buzzards*, such as *F. buson* and *F. tachiro* of Daudin, *F. pæcilonotus* of Cuvier, &c., may not be more properly removed to a situation between the *short-winged Eagles* and the *Hawks*, with both of which they seem to have a considerable affinity. There is, continues Mr. Vigors, another group which also appears allied to the present, distinguished by a rather feeble and elongated bill, short wings, and slender, lengthened *tarsi*, feathered to the toes. It includes *F. limnæetus* of Horsfield (*Zool. Res.*, No. 6, Pl. Col. 134), *F. niveus* of Temminck (Pl. Col. 127), and *F. atricapillus* of Cuvier (Pl. Col. 79.) These appear to be strongly allied, in the opinion of Mr. Vigors, if not to appertain, to the before-mentioned genus *Morphnus*. *F. tyrannus* of Prince Maximilian (Pl. Col. 73) bears also, Mr. Vigors thinks, a strong similitude to the same group, though partially differing in external characters.

2. Sub-family *Accipitrina* (Hawks).

Beak short, hooked from the base; *wings* short, fourth *quill* longest.

'The short wings of the last groups,' writes Mr. Vigors, 'lead us to the present division of *Hawks*, all of which, a considerably extensive tribe, are characterized by their wings extending no further than two-thirds of the extent of their tail. The fourth quill-feather is the longest, the first, second, and third, gradually exceeding each other in length. In this division we may observe that the upper mandible, though not furnished with distinct teeth like the true *Falcons*, has the festoon or prominence that generally supplies its place more strong and angular than is usual among these tribes. In some of the *Accipitres* this is particularly distinguishable. The sub-family we have just quitted includes all the birds of the present family in which the beak is straight at the base, and hooked only at the apex. We now enter upon the first of those groups where the bill is curved from the base, a character that extends through the remainder of the *Falconidæ*. It may be observed, that this character, which thus separates the family into two departments, was equally noticed as a mark of distinction between the species known to the antients. Pliny, apparently referring to it as a line of demarcation between them, divides the group into his two departments of *Aquilæ* and *Accipitres*. It is from adopting the same views respecting

the family, that M. Brisson instituted his two leading divisions, to which he assigned corresponding denominations.'

Dædalion (Savigny).

Beak short; *tarsi* moderate; *acrotarsia* reticulated; type *F. cachinnans* of Linnæus, and *F. melanops* of Latham.

Mr. Vigors adopts the name which was conferred by M. Savigny on the whole of the sub-family, for the present division of it.

Example, *Dædalion melanops.*

Description.—(Adult male) white, flamed with black on the *neck* and *breast*; *back*, *wings*, and *tail*, deep black, the last with a white stripe, and terminated with white; there are dots of the same colour on the coverts of the *wings*; *cere* and *tarsi* reddish. *Locality*, Guiana. The form may be illustrated by the

Head and foot of Dædalion cachinnans.

Astur (Bechstein).

Beak short; *nostrils* suboval; *tarsi* moderate; *acrotarsia* scutellated.

Mr. Vigors observes, that *Astur* is a title which has been applied to the whole group, but which may be confined to those whose tarsi, moderate in length, have their *acrotarsia* scutellated or covered with broad and even scales. He considers our European species, *Falco palumbarius* of Linnæus, as the type; to which may be added *F. Novæ Hollandiæ* of Latham, and a considerable number of corresponding species from every quarter of the globe.

Example, *Astur palumbarius.*

Description.—This is the *Autour* and *Atour* of the French; *Astore* (Zinan.) and *Girifalco* (Bonaparte), *Sparviere da columbe* and *Sparviere Terzuolo* of the Italians; *Grosser gepfeilter Falck* and *Hunerhabicht* of the Germans; *Goshawk* of the modern, and *Hebog Marthin* of the antient British.

A full-grown *female* measures from twenty-three to twenty-four inches in length; the males one-fourth, and sometimes one-third less; but when adult, the plumage is nearly similar. The beak is horn-colour or bluish-black; the cere and irides yellow; the top of the head, the whole of the back, upper surface of the wings, and tail-feathers, dark greyish-brown; in females the colour inclines to clove-brown; the upper surface of the tail-feathers barred with darker brown; a band passing over the lore, eyes, cheeks and ear-coverts; the nape of the neck, throat, breast, belly, and thighs, nearly white, with spots, transverse bars, and undulating lines of dull black; under tail-coverts white; lore, cheeks, and ear-coverts, greyish-brown, forming an elongated dark patch on the side of the head; the legs and toes yellow; the claws black.

Young birds have the beak, cere, and eyes, nearly similar to those of the old birds; the top of the head, nape, and ear-coverts, ferruginous white, each feather darker in the middle; back, wings, and upper tail-coverts, brown, margined with buff; upper surface of the tail-feathers with five bands of dark-brown and four bands of lighter brown, the ends of all the feathers white; wing-primaries dark-brown, barred with two shades of brown on the inner webs; the chin, throat, breast, and belly, greyish-white, each feather with a central elongated patch of dark-brown; thighs and under tail-coverts with a dark-brown longitudinal streak instead of a brown patch; under surface of the wings greyish-white, with transverse dusky bars; under surface of the tail-feathers greyish-white, with five darker greyish-brown transverse bars, the tips of all the feathers white; legs and toes yellow-brown; the claws black; those of the inner toe considerably larger than those of the outer. (Yarrell.)

Habits, Food, Reproduction.—Flies low and pursues its prey in a line after it, or in the manner called 'raking,' by falconers. If the game takes refuge it will sit patiently on a tree or stone till it moves, or till some other prey is accessible. *Food*, hares, rabbits, pigeons, pheasants, grouse, and partridges. The female was generally flown by falconers at fur, and the male at feather, but the female was also trained to take the larger winged game, the male being principally flown at partridges. Turbervile says, 'you shal not neede to shew any other game to a goshawke for her first entring than a partridge, because in learning to flee the partridge they prove most excellent; and the first yeare you shall doe best to flee them to the field, and not to the covert, for so will they learne to hold out (and not to turne tayle) in the middest of their flight: when they be mewed hawkes, you may make them doe what you will; and understand you, that you shall not neede to take such pain, nor to use such art in making of a goshawke which is taken a brancher as with a *Nyasse*, for she will alwayes know of her selfe what to doe.' (*The Book of Falconrie.*) *Nest*, on a high tree in the outskirts of the forest; rarely found in the interior, except in those parts which are open and free from timber. Eggs three or four, frequently hatched in the middle of May. (Hewitson, *ex relatione* Hoy.) Mr. Yarrell says that the eggs are rare, and that the few which he has seen were uniform in size and colour, 2$\frac{3}{16}$ths inches in length by 1$\frac{13}{16}$th inch in breadth, of a pale bluish-white, without any spots or streaks.

Locality.—Denmark, Norway, Sweden, Siberia, Russia, and Chinese Tartary. (Müller, Linnæus, Pennant.) Very common in France, Germany, Russia, and Switzerland; more rare in Holland. (Temminck.) Rare in the south of England. Mr. Yarrell says 'the few that are used for hawking are obtained from the continent. Colonel Thornton, who kept them constantly in Yorkshire, procured some of his specimens from Scotland. Dr. Moore, in his catalogue of the birds of Devonshire, says that it is found occasionally in Dartmoor, but I can find no record of its appearance farther west in England, nor any notice of it in Ireland. A fine adult male was trapped by a gamekeeper in Suffolk in March, 1833; and Mr. Doubleday, of Epping, has sent me word that he received a young bird from Norfolk in the spring of the same year. Mr. Selby mentions that he had never seen a recent specimen south of the Tweed, but states that it is known to breed in the forest of Rothiemurcus, and on the wooded banks of the Dee. Mr. Low says that this species is pretty frequent in Orkney; but as he speaks of it in connexion with sea-beaten rocks without shelter or woods, is there not reason to suspect that Mr. Low was mistaken, and that the birds he saw were Peregrine Falcons?—the more so, as several recent visitors to these northern islands have observed peregrines but no goshawks.' (*British Birds.*) Prince Bonaparte has noted the goshawk as not common in the neighbourhood of Rome, and as rare in that of Philadelphia. Dr. Richardson (*Fauna Boreali-Americana*) describes one shot in company with the female at the nest on the plains of the Saskatchewan, and states that another specimen was

killed in the woody country three or four degrees of latitude farther north than the preceding. He records another killed near Jasper's House, on the Rocky Mountains, and a fourth killed at York Factory, supposed to be a young bird of the season (the specimen noticed by Mr. Sabine in 'Franklin's Journey').

The *Falcon-Gentil* is supposed to be the female and young of this species, which is the *Ash-coloured* or *Black-capped Hawk* of Wilson.

Colonel Sykes describes an *Astur* (*A. hyder*) among his birds of the Dukhun (Deccan), and there are specimens of *Astur musicus* and *A. melanoleucus* in the South African Museum.

Astur palumbarius.

Accipiter (of Ray, Brisson, and authors).

Beak short. *Nostrils* suboval. *Tarsi* elongated, smooth. *Acrotarsia* scutellated, the suture scarcely to be discerned. Type, the *Common Sparrow-hawk, Accipiter fringillarius* of Ray: to which, says Mr. Vigors, may be added many corresponding species which do not seem to have any limits to their geographical distribution.

Description.—The *Sparrow-hawk* is *L'Epervier* of the French; *Falco palombino* and *Sparviere da fringuelli* of the Italians; *Die sperber* of the Germans; *Sparfhoek* of the Fauna Suecica; *Falco Nisus* of Linnæus; and *Gwepia* of the antient British.

Adult Male.—About twelve inches in length; *beak* blue, lightest at the base; *cere* greenish-yellow, the *irides* yellow; top of the *head*, nape of the *neck*, *back*, *wings*, and *wing-coverts*, rich dark-brown—in very old males with a tinge of bluish-grey; *tail-feathers* grayish-brown, with three conspicuous transverse bands of dark-brown; *chin, cheeks, throat, breast, belly, thighs*, and under *tail-coverts*, rufous, with numerous transverse bars of darker rufous brown; *legs* and *toes* long, slender, and yellow; the claws curved, sharp, and black.

Female.—Generally three inches longer than the male; *beak* bluish horn-colour; *cere* yellowish, the *irides* yellow; top of the *head*, upper part of the *neck, back, wings*, and *tail-coverts*, brown—the base of many of the feathers white, which, extending beyond the edge of the feather immediately above it, causes a white spot or mark; *primaries* and *tail-feathers* light-brown, barred transversely with darker brown; under surface of the *neck, body, wing-coverts*, and *thighs*, greyish-white, barred transversely with brown; under surface of the *wing* and *tail-feathers* of the same colour, but the light and dark bars much broader; the first six *wing-primaries* emarginated; the fourth and fifth *quill-feathers* equal and the longest, the first *quill-feather* the shortest; *legs* and *toes* yellow; *claws* long, curved, sharp, and black.

Young Male.—Resembles the female; but the brown feathers of the *back* and the *wing-coverts* are edged with reddish-brown; feathers of the *tail* reddish-brown, particularly toward the base, with three conspicuous dark-brown transverse bands. In other particulars like the female: both have a collar formed by a mixture of white and brown, which extends from the sides of the neck to the nape. (Yarrell.)

Habits, Food, Reproduction.—Haunts, wooded districts. The great enemy of small quadrupeds and birds, and often very destructive to young chicks in poultry-yards in the breeding season. Used in falconry; the best of all hawks for landrails. (Sebright.) *Nest.* 'The *Sparrow-hawk* generally takes possession of some old or deserted nest in a tree, most frequently that of the crow, in which the female deposits four or five eggs, each about one inch seven lines long, by one inch four lines broad, of a pale bluish-white, blotched and spotted with dark-brown. The young are covered with a delicate and pure white down, and are abundantly supplied with food. Mr. Selby mentions having found a nest of five young sparrow-hawks, which contained besides, a lapwing, two blackbirds, one thrush, and two green linnets, recently killed, and partly divested of their feathers.' (Yarrell.)

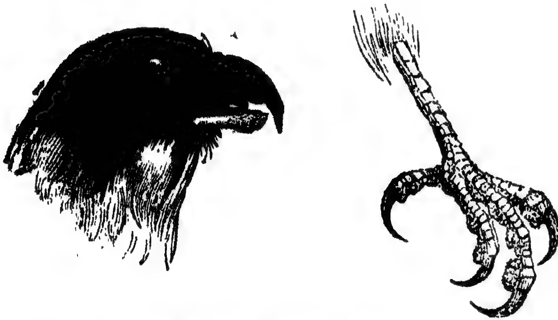
Locality.—Spread throughout Europe, Japan (Temminck), Smyrna (Mr. Strickland), Denmark, Sweden, Norway, Russia, and from thence southward over the European continent to Spain and Italy. Common in most of the counties of England, and has been observed in the west and north of Ireland; occurs also in Scotland and its northern islands. (Yarrell.) Very common, migratory, near Rome. (Bonaparte.)

Head and foot of Accipiter fringillarius.

The form is widely spread. Col. Sykes records *Accipitres Dukhunensis* (resembling *A. fringillarius*, but differing in certain points), and *Dussumieri* among the birds of the Dukhun (Deccan). In the South African Museum will be found *Accipitres polyzonus, polyzonoïdes, niger, Gabar, Tachiro, minulus*, and *rufiventris*.

Mr. Vigors remarks that there are some species which seem to be allied to this sub-family and to be intermediate between it and the succeeding sub-family of *Falconæ*, which, from some peculiarities of character, cannot well be appended

to any established genus. They possess, he observes, a shortness of wing which would incline us to refer them to some of the present groups: but their upper mandible, strongly and doubly dentated, presents a character that will not admit of their being included in any of the foregoing genera, in which the mandibles are entire, or where the place of the tooth is supplied by a rounded prominence. These species Mr. Vigors would have wished to arrange in one genus: but they are found to differ in essential points which bring them respectively within the pale of the two conterminous sub-families now under consideration; and he feels obliged, for the sake of perspicuity, to adopt the following genus of which the type is *Falco bidentatus* of Latham.



Harpagus. (Vigors. Bidens* of Spix.)

Beak short. Upper *mandible* strongly bidentated, lower with a double notch. *Tarsi* moderate. *Acrotarsia* scutellated. Third and fourth *quills* longest, equal.

Mr. Vigors observes that the essential characteristic of this group is the double tooth on both the upper and lower mandible. The wings, which correspond with those of the other *Hawks*, in being one-third shorter than the tail, have the third and fourth quill feathers, which are the longest, of equal length. The *tarsi* are of moderate length and strength, and have the *acrotarsia* scutellated as in the latter groups of the present sub-family. The *nostrils* are of a semicircular form and the *cere* is naked.

Example, *Harpagus bidentatus*. Locality, Brazil, and Guiana.

Description.—Length, a foot and some lines (French). Slate-colour above; *throat* white; *breast* and *belly* red, undulated with yellowish; lower coverts of the *tail* white; *tail* nearly equal, brownish, barred with whitish.

Head and foot of Harpagus bidentatus.

Mr. Vigors remarks that *Falco Diodon* of Temminck is to be referred to this genus.†

Gampsonyx. (Vigors.)

Beak short, *mandibles* entire. *Nostrils* rounded. *Wings* short, second *quill* longest, third generally equal to the second, and internal web of the first and second strongly notched near the apex. *Tail* moderate, equal. *Feet* moderate; *tarsi* reticulated, *acrotarsia* feathered below the knee to the middle. (Vigors.)

'The genus is founded on a small and beautiful *Hawk*,' writes Mr. Vigors in 'The Zoological Journal,' vol. ii., 'which has been kindly submitted to my inspection by Mr. Swainson, one of the fruits of that gentleman's extensive researches in Brazil. This bird decidedly belongs to the *Accipitrine* sub-family of the *Falconidæ*; but it is placed at that remote extremity of it, where the species, gradually approaching the *Falcons*, partially assume some of their leading characters. It possesses the bill of the *Hawks*, and also the shortness of wing which so strongly characterizes them: but the structure of the wing itself is the same as in *Falco*, the second quill-feather being the longest, and the first and second of these feathers being marked on the same web by an abrupt emargination near the *apex*; while the *tarsi* also display the character of the same group in having the *acrotarsia* reticulated. The bird thus exhibits a striking modification of form, at once partaking of the chief of the respective characters of both the *Hawks* and *Falcons*; with the former of which it may in addition be observed that it agrees in its general form, and with some of the latter, particularly the beautiful group of *Ierax cærulescens*, in its colours, and in the general distribution of them. To the latter group indeed it has a striking resemblance, and might perhaps be referred unconditionally to it, could we pass over the important character of the untoothed bill.'

Description of *Gampsonyx Swainsonii*. Above cineraceous-black, white beneath; *front, cheeks, sides* of the *abdomen*, and femoral feathers orange; a black spot on each side of the *breast*.

Beak black. Feathers of the *back* and *scapulars* ashy-black, spotted with ferruginous. Lower *side* and *nuchal collar* white, sparingly variegated with orange. *Primaries* blackish, internally margined with white at the apex; *secondaries*, sparingly sprinkled with ferruginous, beneath white. *Tail-feathers* ashy-black, internally (the middle excepted) margined with white, beneath white. *Feet* yellow, *claws* black. Length of the body 9⅜ inches. (Vigors.)

Locality, Brazil. Mr. Vigors says that the following MS. note was appended to this bird in Mr. Swainson's handwriting:—'The only individual of this species I ever met with was shot on the Table Land, about 10 leagues in the interior of Bahia, in a direction west-south-west from the bay of St. Salvador. It was perched on the trunk of a withered tree, apparently watching some small birds. The *tarsi* are bright and the *irides* hazel.'

3rd. Sub-family, *Falconina* (Falcons).

Beak short, hooked from the base. *Wings* long. Second *quill* longest.

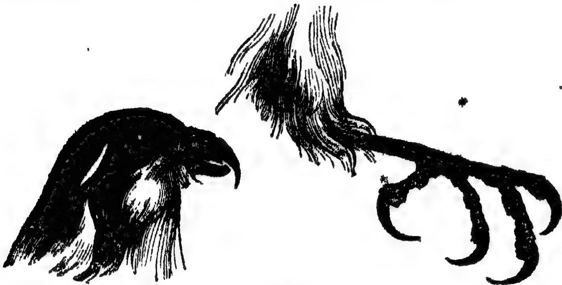
Mr. Vigors observes that this, closely allied to *Harpagus* by the double tooth on its upper mandible, is another group for which he proposes the name of

Ierax.* (Vigors.)

Beak short, upper *mandible* strongly bidentated, lower simply notched. *Tarsi* moderate. *Acrotarsia* scutellated. *Wings* short. Second *quill* longest, slightly notched near the apex.

Hierax cærulescens.

'Whoever,' writes Mr. Vigors, 'has seen that beautiful species, the smallest of its race, *Falco cærulescens* of Linnæus, now rendered familiar to us by the accurate and splendid illustrations of Dr. Horsfield, will at once acknowledge its separation from every other established genus of the family. Its upper mandible is strongly and sharply bidentated, as in *Harpagus*, but the under mandible is simply notched as in the true *Falcons*. Its wings, shorter than the tail, differ also from those of *Harpagus*, in having the second quill-feather the longest, thus again establishing the affinity of the genus to the *Falcons*. The *tarsi* are moderate, and the *acrotarsia* scutellated as in the latter group of *Hawks*. From its thus possessing characters in common with both sub-families, it is difficult to say to which we should refer



* Mr. Vigors observes that the term *Bidens* is appropriated to Botany, and is indeed a Linnæan genus.

† For the description of Mr. Swainson's genus *Avicida*, the reader is referred to the interesting work on the Birds of Western Africa by that zoologist, 'Naturalist's Library,' vol. [illegible], p. [illegible]. [illegible] Falcon.

* Hierax, [illegible].

it. But I prefer placing it in its present situation on account of the length of the second quill-feather, a peculiarity which distinguishes the true *Falcons*, and gives a striking character to their flight. Placed, however, at the extremity of the division, it preserves its affinity with those that went before.'

Description.—Hierax cærulescens is, according to Dr. Horsfield, the *Allap*, or *Allap-allap* of the Javanese; *Falco cærulescens* of Linnæus; *F. Bengalensis* of Brisson; *Falco parvus Indicus* Ger. Orn.; *Little black* and *orange Indian Hawk* of Edwards; and the *Bengal Falcon* of Latham. Entire length six inches and a half. Upper parts bluish-black and glossy. Throat, breast, axillæ, sides of the neck, forehead, and a line continued from the environs of the bill over the eye and along the neck, white, with a ferruginous tail. Lower part of the breast, abdomen, vent and thighs, ferruginous. Hypochondria, thighs posteriorly, and a broad patch extending from the eye along the side of the head, black; the plumes which cover the thighs behind are terminated by long silky filaments, or radii which are straggling and pendulous, and by their laxity and irregularity afford a peculiar character to the bird. (Horsfield.) The natives told Dr. Horsfield that this small but robust bird was uncommonly bold in the pursuit of little birds. Several individuals were brought to him from the range of the southern hills, which are covered with forests, during his abode at Surakarta. He obtained one in the eastern districts. In the other parts of the Island of Java he did not observe it. Bengal is also given as its locality.

Head and foot of Hierax cærulescens.

Mr. Vigors (*Zool. Proc.* 1831) describes another species, *Hierax erythrogenys*, the size of *H. cærulescens*, from the neighbourhood of Manilla.

Falco.

Beak short. Upper *mandible* strongly toothed; lower notched. *Acrotarsia* reticulated. Second quill longest; first and second deeply notched internally near the apex.

This genus, which includes, as Mr. Vigors observes, the greater portion of the present sub-family, comprises the typical species. 'The upper mandible of this group,' writes that zoologist, 'is armed with a strong angular tooth; the lower is notched near the extremity. The *nares* are rounded. The wings are for the most part as long as the tail, the second quill-feathers being invariably the longest. The first and second quill-feathers are also distinguished by an abrupt emargination on the inner web near the extremity. In some species, as in *F. peregrinus*, the emargination of the second quill-feather is not so abrupt as in others. But in all the species of the true *Falcons* that have come under my examination, this emargination of the first quill-feather at least is strongly apparent. The *tarsi* are moderate in length and strength, and have the *acrotarsia* reticulated. Our European species, *F. peregrinus*, Linn., *F. subbuteo*, Linn., *F. Æsalon*, Linn., *F. rufipes*, Bechst., are readily distinguished as belonging to this typical genus. Some species belonging to the group have the wings somewhat shorter than the tail, which, in conjunction with *Ierax*, thus evinces a gradual series of affinity between the short and long-winged tribes. Among these we may distinguish *F. tinnunculus*, Linn.; *F. rupicolus*, Daud.; with some corresponding species.' Example, *Falco peregrinus*.

Description.—The *Peregrine Falcon* is *Le Faucon pelerin* of the French; *Sparviere pellegrino* and *Falco reale* of the Italians; *Wander Falke* of the Germans; *Apestæ-kæoo* (Little Eagle) of the Cree Indians; *Hebog tramor* and *Cammin* of the antient British.

Adult.—Length from 15 to 18 inches, depending on the sex and age of the bird. *Beak* blue, approaching to black at the point; *cere* and *eyelids* yellow, *irides* dark hazel-brown; top of the *head*, back of the *neck*, and a spot below the eye nearly black; *back* and upper surface bluish-slate or ash colour, becoming lighter at every succeeding moult; the males usually the most so; feathers of *back*, *wing-coverts*, and *tail* barred with a darker tint; *primaries* brownish black, inner webs barred and spotted with rufous white; front of *neck* white, with dark longitudinal lines; *breast* rufous white, with dark-brown transverse bars; *flanks*, under *tail-coverts*, and under surface of the *tail-feathers* barred transversely with dark-brown and greyish-white; *legs* and *toes* yellow, *claws* black.

Young.—Head and upper surface of *body* and *wing-coverts* brownish ash, the edge of each feather rufous; the dark longitudinal streaks on the white under-side of the body more conspicuous, but, gradually shortening and spreading laterally, they ultimately change their direction, and become transverse. This change is first observed on the belly and flanks. (Yarrell.)

Temminck considers the *Lanier* (Lanner) of Buffon the perfect state of the male *Peregrine*. He also adds *Falco Barbarus* of Latham as one of its synonyms.

Habits, Food, Reproduction.—The food of the Peregrine consists of land and water-fowl, rabbits, young hares, &c. It was highly prized in falconry. Turbervile, in his chapter 'Of the Haggart Falcon, and why she is called the Peregrine or Haggart,' gives the following reasons for the name: 'First, because a man cannot find, nor ever yet did any man, Christian or Heathen, find their eyrie in any region; so as it may wel be thought, that for that occasion they have atchieved and gotten that name and terme of Peregrine or Haggart Falcons, as if a man would call them pilgrims or forainers. The second cause is, because these falcons do rangle and wander more then any other sort of falcons are wont to doe, seeking out more strange and uncouth countries, which indeed may give them that title of Haggart and Peregrine Hawks for theyr excellency, because they doe seeke so many strange and forraine coasts, and doe rangle so farre abroad. The third and last cause, I doe thinke, may be their beauty and excellency, because this word (*Peregrino*), or Peregrine, doth many times import an honourable and choice matter had in great regard. . . . Wherefore I conclude that these Haggart Falcons are not of Italie, but transported and brought thither from forraine places, as, namely, from Alexandrie, Ciprus, and Candie. And yet this is for certaine, that in Italie there are taken of these Haggart Falcons, as in the dominion of the renowned duke of Ferrara and in the countrie near Ravenna, being brought thither by force of weather and wind. And by that means there are none of those Haggarts found Eyesses, but they are al either soare Hawks or mewed Haggarts.'

'In the language of falconry,' writes Yarrell, 'the female Peregrine is exclusively called the Falcon, and on account of her greater size, power, and courage, is usually flown at herons and ducks; the male Peregrine, being smaller, sometimes one-third less than the female, is called the Tercel, Tiercel, and Tiercelet, and is more frequently flown at partridges, and sometimes at magpies. Young Peregrines of the year, on account of the red tinge of their plumage, are called, the female a red falcon, and the male a red tiercel, to distinguish them from older birds, which are called Haggards or intermewed Hawks. The Lanner of Pennant is a young female Peregrine, at which age it bears some resemblance to the true Lanner, *Falco lanarius* of authors—a true falcon also, but much more rare than the Peregrine, and which probably has never been killed in this country. Mr. Gould says he was unable to find a specimen in any collection here, either public or private, at the time he was desirous of figuring this species in his birds of Europe. The true Lanner is only found in the south and south-eastern parts of Europe. The king of France, Louis XVI., had Lanners sent annually from Malta; but they were brought from the eastern countries. It exceeds the Peregrine Falcon in size, being intermediate between that and the Gyr-falcon; was much esteemed for flying at the kite, with which the Peregrine is hardly able to contend.' The name of Lanner is confined to the female: the male is called a Lanneret, on account of his smaller size. (*British Birds.*) Our limits will not allow us to enter into any account of the mode of flying it at herons, &c., flying at the brook or at the river, as it was antiently called; and we must refer the reader to Turbervile, among

the old writers, and to Sir John Sebright as the best of the modern authors on the subject. (See Sir John's *Observations on Hawking.*) *Nest.*—On high rocks. In Britain, Mr. Yarrell states that the Peregrine builds on various parts of the coast, more frequently in Scotland than in England. The eggs are from two to four in number, about two inches long by one inch and eight lines in breadth, mottled all over with pale reddish brown. Mr. Selby notices their eyrie at St. Abb's Head. It was from this locality that the late Mr. Baird of Newbyth usually obtained his cast of Hawks, for each of which he gave the persons who undertook the peril of climbing the rock one guinea. Other localities for the nest in Britain are the cliffs between Freshwater Gate and the lighthouse near the Needles. Devonshire and Cornwall, where it is called *Cliff Hawk.* Holyhead and the Great Orme's Head. (Yarrell.) Rocky coast of Caernarvonshire. (Pennant.) Rocky situations inland and marine in Ireland. (Thompson quoted by Yarrell.) Vale of Moffat in Dumfriesshire, the Bass Rock, and the isle of May, in the Forth. (Sir Wm. Jardine.)

Localities.—All the mountainous countries of Europe, particularly on rocks; very rare in champaign countries; never found in marshy districts; abundant in Germany and France; sufficiently common in England and Holland; rare in Switzerland. (Temminck.) Shetland Isles, where it breeds; Denmark, Sweden, Norway, Lapland, and Greenland. (Yarrell.) Uralian and Siberian mountains. (Pennant.) Dr. Richardson, who describes an old male from Melville Peninsula, lat. 68° N., says (*Fauna Boreali-Americana*), 'The Peregrine being a rare bird in the wooded districts of the fur countries where the trading posts are established, I did not procure a specimen on the late expeditions; but I have frequently seen it whilst on the march across the Barren Grounds. Of the two specimens figured by Edwards, one was from Hudson's Bay and the other was caught off the entrance of Hudson's Straits. Captain Parry likewise brought home several male and female specimens from Melville Peninsula, some of which are preserved in the British Museum. It is a summer visitor of the northern parts of America, and frequents the coasts of Hudson's Bay and the Arctic Sea, with the Barren Grounds, but is very seldom seen in the interior. It preys habitually on the long-tailed ducks (*Anas glacialis*), which breed in great numbers in the Arctic regions, arriving in June and departing in September. Captain Parry observed it, in his second voyage, following flocks of the snow-bunting on the coast of Greenland, near Cape Farewell. It frequents the shores of New Jersey and Pennsylvania in the winter, and is celebrated there for the havoc it makes among the water-fowl. Mr. Ord states that the ducks which are struck by it are lacerated from the neck to the rump; it gives the blow in passing, and returns to pick up its bird.' Port Famine, straits of Magalhaens. (Captain King.) New Holland. (Vigors and Horsfield.) Cape of Good Hope. (Dr. A. Smith.) Prince Bonaparte notes it as rare, and as seen only in winter near Rome, and as rare and casual near Philadelphia. Dr. Smith (*South African Museum*, No. 94) says that the bird so numbered, though it does not exhibit exactly the plumage of the Peregrine Hawk of Europe, yet approaches it so closely, that it might be considered as attempting too great a refinement to class it as a different species.

Falco peregrinus.

Mr. Vigors observes that Cuvier has separated the *Falco Islandicus* of Latham from the rest of the true *Falcons*, under the generic title of *Hierofalco*, which he characterizes as possessing no tooth on the upper mandible, but a rounded prominence in the centre, and in which he observes that the wings considerably fall short of the tail in length. In this opinion Mr. Vigors does not acquiesce. He cites examples of the Jerfalcon in its different stages of growth, and in none did he perceive any material difference between its bill and that of the true *Falcons.* He adds that he feels much hesitation in advancing the above opinion, not merely on account of the known accuracy of Cuvier, but on account of some facts that had then lately come to his knowledge. He mentions a specimen in the British Museum, in which the mandible accords exactly with Cuvier's description—'Il n'a qu'un feston comme celui des ignobles.' In several specimens from the arctic regions, however, in the same collection, he found the tooth. After referring to the figures quoted by Cuvier, and their discrepancies, he inquires whether it may not be possible that there are two species. He cannot think that the character itself is variable, or that Cuvier would have adopted one which must have been known to him as such, even from the plates. 'In no specimen of a true falcon,' says Mr. Vigors, 'have I seen the slightest alteration of the tooth, except by accident.'

Our limits will not permit us to do more than hint at the other species of *Falco.* *F. chicquera,* Himalaya Mountains (Gould), Deccan (Sykes), South Africa (Smith), seems to be the nearest in typical points to the Peregrine Falcon. The following *Falcones*, besides *F. peregrinus* and *F. chicquera*, are in the catalogue of the South African Museum; *biarmicus, rupicolus, rupicoloïdes, subbuteo,* and *Swainsonii*: *F. tinnunculus, the Kestrel,* inhabits Asia and Africa, as well as Europe, and is very abundant in the Dukhun (Deccan). (Sykes, Abbott.)

4th. Sub-family, *Buteonina* (Buzzards).

Beak moderate, hooked from the base. *Tail* equal.

The sub-family of the *Buzzards* agrees, in the opinion of Mr. Vigors, with the last in the length of the wings, and the bill being bent from the base, and differs from it by a weaker and somewhat more elongated bill, by the third or fourth quill-feather being longest, and more particularly by the absence of a tooth on the upper mandible. A gradation seems, however, as Mr. Vigors observes, to soften down these differences, and there is an approximation to the teeth of the falcons in the first genus of the sub-family.

Ictinia (Vieillot).

Beak short. Upper *mandible* subdentated, lower notched. *Tarsi* short and weak. *Acrotarsia* scutellated. *Wings* long. Third *quill* longest.

Mr. Vigors states that this genus is founded upon the *Milan Cresserele* of M. Vieillot, and has a strong and short bill, the upper mandible of which is somewhat angularly festooned, and the under distinctly notched. The *nares* are rounded as in the *Falcons*; the *tarsi* are rather short and feathered below the knees, and the *acrotarsia* scutellated. The wings are of considerable length, extending far beyond the tail; a character which induced M. Vieillot and others to place the bird near the *Kites.* Its strong affinity however to the last sub-family, of which it possesses so many of the characteristics, inclines Mr. Vigors to assign it its present situation. In manners, he adds, it seems also to approach the falcons; and he remarks that if we consider the *Mississippi Kite* of Wilson to belong to the present group of Vieillot, of which Mr. Vigors has little doubt, we must attribute to the bird before us, judging from the interesting description in the *American Ornithology*, much of those

spirited and generous qualities which we admire in the typical groups of the family.

Example, *Ictinia plumbea.* (*Falco plumbeus* of Latham.)

Description.—*Back* and *wings* slate-blue; *head* and *belly* whitish, spotted with brown. *Iris* fine red.

Habits.—Said to fly to a great height, where it remains a long time poised or stationary, and cleaves the air with rapidity in order to seize the great insects which are its prey, independently of reptiles and birds.

Locality, America.

Head and foot of Ictinia plumbea.

Circus (of Authors).

Beak moderate. *Nostrils* sub-oval. *Tarsi* elongated. *Acrotarsia* scutellated. *Toes* generally short. Third *quill* longest. Sides of the *head* furnished with a circle of feathers, very like the capital disk of the *owls*.

This genus, says Mr. Vigors, exhibits still a slight approximation to the last groups in the structure of the upper mandible, which has a rounded protuberance towards the middle, similar to that of the *Hawks*. They are distinguished from the rest of the buzzards by their elevated and slender *tarsi*, which are covered with feathers for some space below the knee, and of which the *acrotarsia* are scutellated. The *nares* are sub-oval and transverse on the cere, and the third quill-feathers are the longest. It includes, according to Mr. Vigors, the European species *F. æruginosus* of Aldrovandus, and *F. pygargus* of Linnæus, to which, he says, may be added, *F. acoli* and *F. melanoleucos* of Daudin, together with some newly described species.

Example, *Circus æruginosus*.

Description.—This is the *Harpaye, Busard Harpaye*, and *Busard de Marais* of the French; *Falco castagnolo* and *Falco con la testa bianca* (young birds), *Falco albanella con il collare* (old), of the Italians; *Schwartz-brauner, Fisch-Geyer mit dem gelben Kopf, Brauner rohr Geyer, Brandweihe, Wasserweihe*, and *Sumpfweihe*, of the Germans; *Moor-Buzzard, Marsh-Harrier, Duck-Hawk, Harpy*, and *White-headed Harpy* of the modern, and *Bod y gwerni*, of the antient British.

Adult Male (third moult).—*Beak* bluish black, with a slight festoon on the cutting edge; *cere* and *irides* yellow; top of the *head, cheeks*, and *nape* of the neck, yellowish white, tinged with rufous and streaked with dark brown; *back, wing-coverts*, and *tertials*, dark reddish brown with lighter margins; *primaries* brownish black; *secondaries* and *tail-feathers* ash-grey.

After the third moult.—*Wing-coverts* and *tertials* become in addition, partially or entirely ash-grey; wing *primaries* slate-grey; *chin* and *throat* nearly white; *breast* rufous, streaked longitudinally with dark brown; *belly, thighs*, and under *tail-coverts* reddish-brown, each feather streaked with dark brown; *legs* long, slender, and yellow; *toes* yellow; *claws* sharp and black.

Second year.—*Head, neck, chin*, and *throat* dull yellow, with an occasional patch of the same colour on the carpus, or anterior point of the wing. (Bewick's figure.)

Young of the year.—All the plumage chocolate brown; feathers tipped with lighter reddish brown; irides darker than in the adult; legs and feet as in old birds. Length from twenty-one to twenty-three inches, depending on the sex. (Yarrell.)

Habits.—*Food.*—*Reproduction.*—The moor-buzzard, when in pursuit of game, flies low, and will, so to speak, beat a moor, or other piece of ground, with the regularity almost of a well-trained pointer. Young rabbits, small quadrupeds, birds, especially water-birds, reptiles, and even fish, are its prey. Sometimes it will sit on the look-out on a stone or low bush. *Nest.*—Generally on the ground, in a tuft of rushes, or coarse grass, or furze, and composed of rushes, or rank grass, and small sticks. Latham says that it will sometimes build its nest in the fork of a large tree, but that the instance is rare. Eggs, three or four, oval, rather pointed at one end, two inches and one line in length, one inch six lines in breadth (Yarrell).

Locality.—Denmark, Norway, Sweden, south of Russia, Germany, France, Holland, Spain, Italy, Turkey. In all countries where there are marshes, very abundant in Holland; rare in the south, migratory in the autumn (Temminck); common in the marshes near Rome, but only young birds, and migratory (Bonaparte); Trebizond (Abbott), Ganges, between Calcutta and Benares, &c. (James Franklin). Europe, India, Africa (Gould). Smyrna (Strickland).

The *Moor Buzzard* may be seen in most parts of England and Wales favourable to its habits. It occurs in Scotland and the Hebrides, and Mr. Thompson notes it as existing in several counties of Ireland from Cork to Antrim.

Mr. Vigors observes that the sub-family of *Buzzards* is that which of all the *Falconidæ* approaches nearest to the family of the owls (*Strigidæ*). In their dull and slothful habits, their heavy flight, and indeed their whole appearance, these contiguous groups evince, he remarks, a general resemblance indicating a corresponding inferiority in the qualities which distinguish the birds of prey. The soft and loose texture of the plumage of both presents a similar affinity, and he adds that *Circus*, in particular, furnishes us with a still further and more intimate point of resemblance. The feathers that cover the cheeks and ears form, as he says, a sort of rounded collar that rises on each side of the face; thus exhibiting a conformity to the disk, or circular erection of the face-feathers so conspicuous in the owls.

Circus Æruginosus.

Speaking of *Circus Cyaneus, Hen Harrier*, Mr. Gould, in noticing the Trebizond collection of birds presented to the Zoological Society by Mr. Keith Abbott, says that European, African, Indian, Chinese, and North American specimens present no specific difference. *Circus cineraceus* he notes as European, Indian, and African. (*Zool. Proc.*,

1834.) In the South African Museum will be found *Circi ranivorus* (with habits very much resembling those of our Moor Buzzard), *Maurus*, *Swainsonii*, and *Le Vaillantii*. In the British Museum there is a very good series of the *Moor Buzzard*, illustrating the different changes of plumage.

Pernis. (Cuvier.)

Beak moderate. *Lore* covered with serrated feathers. *Tarsi* moderate, semi-plumed. *Acrotarsia* reticulated. Third *quill* longest.

Mr. Vigors observes that *Pernis* is distinguished by the singular character of the *lorum*, that surrounds the eye, being covered with feathers, instead of being naked as in the other *Falconidæ*, or furnished only with hairs. In other respects also, he states, the genus differs from that of *Buteo* which follows. Its *acrotarsia* are reticulated, and, like *Circus*, it has the third quill the longest. The *nares* are similar to those of *Buteo*. *Falco apivorus* of Linnæus, the *Honey Buzzard*, and a corresponding species from Java, *F. ptilorhynchus* of Temminck, form, he adds, the typical species of the genus. Example, *Pernis apivorus*.

Description.—The *Honey Buzzard* is *La Bondrée* and *Busé Bondrée* of the French; *Wespen-Busard* of the Germans; *Frosch-geyerl* of Kramer; *Slag-hok* of the 'Fauna Suecica;' *Muse-Haag* and *Muse-Baage* of Brunnich; and *Bod y mel* of the antient British.

Old male.—Space between the eye and the beak covered with small serried feathers. Top of the *head* very pure ashy-blue; upper parts of the body brown, more or less ashy; *secondaries* barred alternately with blackish blue and grey blue; *tail* with three bands of blackish brown, at unequal distances; *throat* yellowish white with brown spots; *neck* and *belly* marked with triangular brown spots on a whitish ground; *cere* deep ash; interior of beak, *iris* and feet yellow. Length about two feet.

Female and young.—Ashy-blue on the forehead only; front of the neck marked with great spots of bright brown; breast and belly yellowish red with deeper spots; under surface of the body often whitish with reddish brown spots.

Young of the year.—*Cere* yellow; *iris* bright brown; *head* spotted with white and brown; under part of the body reddish white with great brown spots; feathers of the upper parts bordered with reddish. (Temminck.)

Habits.—Food.—Reproduction.—The *Honey Buzzard* feeds on field-mice, moles, mice, hamsters, birds, reptiles, wasps and other insects. (Temminck.) 'Examinations,' says Mr. Yarrell in his 'British Birds,' 'have usually proved the food to have been the larvæ of bees and wasps, to obtain which the receptacles containing them are scratched out and broken up in the manner described by Sir William Jardine.* In one instance, in the case of a Honey Buzzard kept in confinement, I was told that it killed and ate rats, as well as birds of considerable size, with great ease and good appetite.' The same author records that the stomach of a specimen killed in the north of Ireland and examined by Mr. Thompson of Belfast, contained a few of the larvæ and some fragments of perfect coleopterous insects; several whitish-coloured hairy caterpillars; the pupæ of a species of butterfly, and also of the six-spot hornet moth. Willughby says, 'In the stomach and guts of that we dissected we found a huge number of green caterpillars of that sort called *Geometræ*, many also of the common green caterpillars and others.' White's specimen had in its stomach limbs of frogs, and many grey snails without shells. Willughby says that it runs very swiftly like a hen. Vieillot states that it seldom flies, except from one tree to another, or from bush to bush, and then always low, and that it runs on the ground with great rapidity like the common fowls. *Nest* on a lofty tree in a wood or forest. White mentions one on a tall slender beech near the middle of Selborne Hanger. Willughby says, 'It builds its nest of small twigs, laying upon them wool, and upon the wool its eggs. We saw one that made use of an old *Kite's* nest to breed in, and that fed its young with the *nymphæ* of wasps; for in the nest we found the combs of wasps' nests, and in the stomachs of the young the limbs and fragments of *Wasp-maggots*. There were in the nest only two young ones, covered with white down, spotted with black. Their feet were of a pale yellow, their bill between the nostrils and the head white. Their craws large, in which were *Lizards*, *Frogs*, &c. In the craw of one of them we found two *Lizards* entire, with their heads lying towards the bird's mouth, as if they sought to creep out.' The same author says that the eggs are cinereous, marked with darker spots. The egg mentioned by White was smaller and not so round as those of the common *Buzzard*, dotted at each end with small red spots, and surrounded in the middle with a broad blood-red zone. Pennant mentions two blotched over with two shades of red, somewhat darker than those of the *Kestrel*. 'The eggs of the Honey Buzzard,' writes Mr. Yarrell, 'are rare: I have only seen three or four specimens, one of which answered to the description given by White, the colouring matter being confined to a broad band round the middle. One specimen in my collection resembles those mentioned by Pennant, being mottled nearly all over with two shades of orange brown: long diameter 2 inches 1 line; transverse diameter 1 inch 9 lines.'

* Address to the members of the [illegible] Club, September, 1835.

Locality. Oriental countries; very rare and accidental in Holland; more abundant in France in the Vosges and in the south, a bird of passage (Temminck). Denmark, Norway, Sweden, Russia, Germany, France, Italy and the south of Europe generally (Yarrell and authors by him quoted). Skins received from India (Gould). In Britain the bird has been obtained in Suffolk, Norfolk, and along the eastern coast as far north as Northumberland, and in several western counties, including Dorsetshire, Devonshire, and Worcestershire. Rare in Cumberland, according to Dr. Heysham, who had only met with one specimen, and was told that it bred in the woods at Lowther. Mr. Thompson mentions one killed in the North of Ireland, and Mr. Macgillivray two as having occurred in Scotland. Buffon and others, Bolon among the rest, say that it gets very fat in winter and is then good eating.

Head and foot of Pernis apivorus.

Buteo (of Authors).

Beak moderate, rather weak. *Nostrils* somewhat rounded. *Tarsi* short. *Acrotarsia* scutellated. Fourth *quill* longest.

Mr. Vigors remarks that the true *Buzzards* are known by their comparatively feeble bill, their short *tarsi*, and scutellated *acrotarsia*. Their *nares* are rounded, and their fourth quill-feather the longest. Their *tarsi* are either plumed to the toes, or half-way covered with feathers. Of those whose *tarsi* are completely feathered, *F. lagopus* of Linnæus is the type, according to Mr. Vigors, and *F.* [illegible] of Daudin appears to approach nearly of those birds whose *tarsi* are but half plumed he gives *Buteo vulgaris*, the *Common Buzzard*, as an example, and remarks that the genus is very numerous in species, and that the birds in it are generally to be observed over the globe.

Description.—*Buteo vulgaris* is the *Falco Buteo* of Linnæus; *Bussard Mauser*; *Falco variegatus* of Gmelin; *F.* [illegible] of Merrem; *La Buse* of the French; *Falco* [illegible]

taone and *Pojana* of the Italians; *Mause Falk* and *Wald Geyer* of the Germans; *Quidfogel* of the 'Fauna Suecica;' *Oerne Falk* of Brunnich; and *Bod teircaill* of the antient British. 'The whole length of the Common Buzzard is from 20 to 22 inches, depending on the sex,—the females, as in the *Falconidæ* generally, being the largest. From the habit of seeking food late in the evening, observed in this species, and also in the Rough-legged Buzzard, and in the softer and more downy texture of the feathers, as compared with the plumage of the true Falcons, the Buzzards are considered as indicating an approach to the Owls. The *beak* is bluish black, darkest in colour towards the point; the *cere* yellow, the *irides* generally yellow; but, as the Common Buzzard and indeed all the Buzzards are subject to considerable variation in the colour of their plumage, the irides are observed to vary also, presenting some reference to the prevailing tone of the colour of the feathers. The upper part of the *head*, *occiput*, and *cheeks*, pale brown, streaked longitudinally with darker brown; the whole of the *back*, *wing-coverts*, upper *tail-coverts* and upper surface of the *tail-feathers* dark clove-brown, the latter barred with lighter brown, the feathers of the former-named parts having lighter-coloured edges; the wing *primaries* brownish black; the *chin* and *throat* almost white; front of the *neck*, *breast*, under *wing-coverts*, *belly*, and *thighs* grayish white, barred transversely with dark wood-brown; *legs* and *toes* yellow; the *claws* black.' (Yarrell.)

Varieties.—Falco albidus, Gmel. *Falco versicolor*, Gmel. *Weisslicher Busard*, Borkh. Deut. Orn. (Temminck.)

Habits—Food—Reproduction.—The flight of the Buzzard is slow, and it generally remains perched on some tree in the wooded districts patiently waiting for its prey, viz. small quadrupeds, birds, and reptiles, and even earth-worms and insects. It may be seen sometimes soaring in circles, but not often, and does not pursue its game but pounces at it when on the ground. Its nature is slothful and cowardly, but its philoprogenitiveness appears to be great. The cock buzzard will hatch and bring up the young if the hen is killed (Ray), and, among other instances, Mr. Yarrell records one of a female buzzard kept in the garden of the Chequers Inn, at Uxbridge, which showing an inclination a few years back to make a nest and sit, was supplied with materials and two hen's eggs, which she hatched and afterwards reared the chicks. Since that time she has hatched and brought up a brood of chickens every year. Once they put down chicks just hatched to her to save her the labour of sitting, but she killed them all. Her family, says Mr. Yarrell, in June, 1831, consisted of nine; the original number were ten, but one had been lost. When flesh was given her she was very assiduous in tearing and offering it as food for her nurslings, and appeared uneasy if, after taking small portions from her, they turned away to pick up grain. ('British Birds,' where there is an elegant vignette of the bird and her foster family.) Indeed the young remain with the old birds some little time after they quit the nest, contrary to the usage of other birds of prey, which generally drive away their young as soon as they can fly. *Nest.*—In Scotland, where the bird is said to be bolder, on rocks or on the edges of steep scars or beds of torrents. (Macgillivray.) In England, the buzzard builds (or sometimes takes to a nest) in the fork of a tree in a wood. The eggs are generally three, sometimes four, short oval, two inches three lines in length by one inch ten lines in breadth, of a soiled white, slightly spotted with pale brown. (Yarrell.)

Locality.—Common in all the wooded countries of Europe; very abundant in Holland. (Temminck.) It is well-known, says Mr. Yarrell, over the wooded parts of the Continent of Europe, south of Russia, and inhabits Spain and Italy, passing over the Mediterranean to North Africa: but Trebizond, Smyrna, and Madeira appear to be its limits to the southward. Prince Bonaparte notes it as very common near Rome. In several parts of Ireland it is common (Thompson); not very plentiful in Scotland, nor does it appear in the lists of the birds of Orkney and Shetland, by the Rev. Mr. Low and Mr. Dunn, though it occurs in Denmark, Norway, Sweden, and Russia. Mr. Gould, in noticing the Trebizond birds presented to the Zool. Soc. by Mr. Keith Abbott, among which it was, observes that it was not previously observed in Asia, although there is a nearly allied species in the Himalaya mountains, and that it had not then been noticed in Africa. (*Zool. Proc.* 1834.) In England, though lately more rare, it is still far from uncommon.

Dr. Richardson ('Fauna Boreali-Americana') states that the Common Buzzard arrives in the fur countries in the middle of April, very soon afterwards begins to build its nest, and, having reared its young, departs about the end of September. It haunts the low alluvial points of land which stretch out under the high banks of a river, and may be observed for a long time motionless on the bough of a tree watching for some small quadruped, bird, or reptile to pass within its reach. As soon as it espies its prey, it glides silently into the air, and, sweeping easily but rapidly down, seizes it in its claws. When disturbed, it makes a short circuit, and soon settles on another perch. One of Dr. Richardson's specimens had two middle-sized toads in its crop. It builds its nest, according to the Doctor, on a tree, of short sticks, lining it with deer's hair. The eggs are, he says, from three to five in number, and he remarks that it was seen by the expedition as far north as the 57th parallel, and that it most probably has a still higher range. He gives a description of two; one a male, shot on the 17th June, at the nest, which contained three eggs, on the plains of the Saskatchewan; and another, a female, killed at the nest also, near Carlton, May 22.

Buteo vulgaris.

Buteo Bacha is recorded by Major James Franklin among the collection formed by him on the banks of the Ganges and in the mountain-chain of Upper Hindostan. In the South African Museum the *Buteones Jackal* and *Tachardus* are preserved. The former obtains its name from uttering a cry somewhat similar to that of the small quadrupeds called *Jackalls* at the Cape. It abounds throughout South Africa. (See the Catalogue.) In the same collection will be found *Butaëtes Lessonii*.

5th Sub-family. *Milvina*. (Kites.)

Beak moderate, rather hooked from the base. *Tail* forked. The length of the wings and the forked tail, instruments of action to which the birds are indebted for their peculiar power and gracefulness of flight, are the characters which more particularly separate the *Kites* from the rest of the *Raptores*.

Elanus. (Savigny.)

Beak moderate, weak, compressed. *Tarsi* short, semi-plumed. *Acrotarsia* reticulated. *Claws*, with the exception of the middle one, rounded internally. Second *quill* longest. First and second *quills* strongly notched internally.

Example, *Elanus melanopterus*. *Black-winged Swallow-Hawk.*

Description.—This is the *Falco melanopterus* of Daudin; *E. cæsius* of Savigny; and *Le Blac* of Le Vaillant. *Size* of a *Sparrow-Hawk*. *Plumage* soft and silky, *tail* a little forked. *Above* ash-coloured, *quills* blackish, *beak* and

shoulders black.' *Below* white. *Tail* principally white. *Feet* yellow.

Habits.—The bird is said to live principally upon insects which it captures on the wing.

Locality.—Common in Africa from Egypt to the Cape. There is a specimen in the South African Museum. Savigny speaks of it as being in great abundance in Syria, Egypt, and Barbary. Cranch (Tuckey's expedition) saw great numbers at the mouth of the Congo, and some were sent home from thence. Lesson says that it occurs in New Holland. It is noticed among the birds collected by Major James Franklin on the banks of the Ganges, and in the mountain chain of Upper [illegible]

Elanus melanopterus.

Nauclerus. (Vigors.)

Beak rather short, weak, compressed. *Nostrils* sub-oval, placed in the *cere*, which is furnished with bristles in an oblique direction. *Wings* long; second or third *quill* longest. *Tail* long, very much forked. *Feet* short, weak. *Tarsi* reticulated. *Acrotarsia* feathered below the knee to the middle. *Claws* not cylindrical. *Body* slender, elegant.

Mr Vigors observes that *Nauclerus* is distinguished from the true *Milvus* by the greater development of the character of the forked tail; by the relative proportion of the wing-feathers, the fourth being the longest in *Milvus*; and by the reticulation of the *acrotarsia*, those of *Milvus* being covered with even scales or scutellated. He divides the genus into two sections.

1st.

With the second quill longest.

Example, *Nauclerus Riocourii.*

2nd.

With the third quill longest.

Example, *Nauclerus Furcatus.* *Falco furcatus*, Linn. *Swallow-tailed Hawk.*

Description.—Whole *length* 20 inches. *Beak* bluish-black, *cere* lighter blue, *irides* dark; *head, neck, breast, belly*, under surface of the *wings, sides* of the body, *thighs*, and under *tail-coverts* pure white; *back, wing-primaries, secondaries*, upper *tail-coverts* and *tail-feathers* black, with a purplish metallic lustre; *tertials* black on the outer webs but patched with pure white on the inner; *tail* very deeply forked; *legs* and *toes* greenish blue; *claws* faded orange. (Yarrell.)

Habits—Food—Reproduction—Locality.—We select Mr. Audubon's account of the habits and locality of this graceful bird:—'A solitary individual of this species has once or twice been seen in Pennsylvania. Farther to the eastward the Swallow-tailed Hawk has never, I believe, been observed. Travelling southward along the Atlantic coast, we find it in Virginia, although in very small numbers. Beyond that state it becomes more abundant. Near the falls of the Ohio a pair had a nest, and reared four young ones in 1820. In the lower parts of Kentucky it begins to become more numerous; but in the states farther to the south, and particularly in parts near the sea, it is abundant. In the large prairies of the Attacapas and Oppellousas 't is extremely common. In the states of Louisiana and Mississippi, where these birds are abundant, they arrive in large companies in the beginning of April, and are heard uttering a sharp plaintive note. At this period I generally remarked that they came from the westward, and have counted upwards of a hundred in the space of an hour, passing over me in a direct easterly course. At that season and in the beginning of September, when they all retire from the United States, they are easily approached when they have alighted, being then apparently fatigued, and busily engaged in preparing themselves for continuing their journey, by dressing and oiling their feathers. At all other times, however, it is extremely difficult to get near them, as they are generally on wing through the day, and at night rest on the higher pines and cypresses, bordering the river bluffs, the lakes, or the swamps of that district of country. They always feed on the wing. In calm and warm weather they soar to an immense height, pursuing the large insects called *Musquito Hawks*, and performing the most singular evolutions that can be conceived, using their tail with an elegance of motion peculiar to themselves. Their principal food however is large grasshoppers, grass-caterpillars, small snakes, lizards, and frogs. They sweep close over the fields, sometimes seeming to alight for a moment to secure a snake, and holding it fast by the neck, carry it off and devour it in the air. When searching for grasshoppers and caterpillars, it is not difficult to approach them under cover of a fence or tree. When one is then killed and falls to the ground, the whole flock come over the dead bird, as if intent upon carrying it off. An excellent opportunity is thus afforded of shooting as many as may be wanted, and I have killed several of these hawks in this manner, firing as fast as I could load my gun. The Swallow-tailed Hawk pairs immediately after its arrival in the southern states; and as its courtships take place on the wing, its motions are then more beautiful than ever. The nest is usually placed on the top branches of the tallest oak or pine tree, situated on the margin of a stream or pond. It resembles that of a carrion crow externally, being formed of dry sticks, intermixed with Spanish moss, and is lined with coarse grasses and a few feathers. The eggs are from four to six, of a greenish white colour, with a few irregular blotches of dark brown at the larger end. The male and female sit alternately, the one feeding the other. The young are at first covered with buff-coloured down. Their next covering exhibits the pure white and black of the old birds, but without any of the glossy purplish tints of the latter. The tail, which at first is but slightly forked, becomes more so in a few weeks, and at the approach of autumn exhibits little differ

Nauclerus furcatus.

ence from that of the adult birds. The plumage is completed the first spring. Only one brood is raised in the season. The species leaves the United States in the beginning of September, moving off in flocks, which are formed immediately after the breeding season is over.'

This species, according to Mr. Nuttall, will, like the *Honey Buzzard*, prey upon locusts and wasps, and their larvæ, and make a regular attack on their nests. M. Vieillot states that it visits Peru and Buenos Ayres. Mr. Yarrell gives it a place among the British birds on the authority of two specimens, one killed at Balachoalist in Argyleshire in 1772, and another taken alive in Shaw-gill, near Hawes in Wensleydale, Yorkshire, in 1805. Apparently to avoid the violence of a tremendous thunder-storm, and the clamorous persecution of a flock of rooks which attacked it at the same instant, it took shelter in a thicket, where it was seized before it could extricate itself, on the 6th September. The person who caught it kept it a month; but a door being accidentally left open, it made its escape. It first alighted on a tree at no great distance, from which it soon ascended in a spiral flight to a great elevation, and then went steadily off in a southerly direction as far as the eye could trace it. (*Linn. Trans.*, vol. xiv.)

Milvus (of Authors).

Beak moderate, weak, subangular above; *nostrils* oblique, elliptical; *tarsi* short; *acrotarsia* scutellated; *wings* very long, fourth quill longest; *tail* forked.

Example, *Milvus ictinus*, *Falco milvus* of Linnæus; *Milvus vulgaris* of Fleming and Gould.

Description.—This is the *Milan Royal* of the French from Belon to Buffon; *Pojana, Milvio, Nicchio*, and *Nibbio* of the Italians; *Rother Milan* of the Germans; *Glenta* of Brunnich; *Glada* of the Fauna Suecica; *Kite, Fork-tailed Kite, Glead* or *Glede* (Pennant says from the Saxon 'Glida') of the modern, and *Barcud* of the antient British. In some of the counties of England it is called the *Puttock*, a name also sometimes bestowed provincially upon the common *Buzzard*. In Essex it is called the *Crotched-tailed Puddock*.

Milvus ictinus.

Length about twenty-six inches; *beak* horn-colour; *cere* and *irides* yellow; feathers of the *head* and *neck* grayish-white, streaked along the shaft with ash-brown; feathers of the *back* and *wing-coverts* dark brown in the centre, broadly edged with rufous; inner web of some of the *tertials* edged with white; *primaries* nearly black; upper *tail-coverts* rufous; *tail-feathers* reddish brown, the outer webs of one uniform colour, the inner webs barred with dark brown; the outer *tail-feather* on each side the darkest in colour; *tail* deeply forked; *chin* and *throat* grayish white, streaked with dusky; *breast, belly*, and *thighs*, rufous brown, each feather with a central longitudinal streak of dark brown; under surface of the *wings*, near the body, rufous, with dark-brown feathers edged with red-brown towards the outer part of the wing; under *tail coverts* plain rufous-white; under surface of the *tail-feathers* grayish-white, with the dark bars of the upper surface showing through; *tarsi* and *toes* yellow; *claws* black (Yarrell) The females are larger than the males.

Habits—Food—Reproduction.—The *Kite* sails gracefully in the air, now describing circles and anon with outspread tail remaining stationary. It pounces on its prey, consisting of moles, mice, leverets, rabbits, unfledged birds, and the young of the Gallinaceous tribe especially. It was, when more plentiful than it is at present, a great scourge to the poultry-yard. It will eat frogs and snakes, and, in the 'Magazine of Natural History,' an observer bears witness to its taking fish from a broad river near which he resided. The *nest*, made of sticks, and lined with soft materials, is usually built on the fork of a tree in a thick wood. The eggs are two, sometimes three, short oval, 2 inches 2 lines in length by 1 inch 9 lines in breadth. They are of a dirty white, with a few reddish-brown spots at the large end. The female lays early in the season, and she often makes a vigorous defence when her nest is attacked.

Locality.—France, Italy, Switzerland, and Germany; less abundant in Russia; more rare in Holland; migratory in autumn. (Temminck.) Very common near Rome, especially near the herds of cattle. (Bonaparte.) It also occurs in Siberia, and the country about Lake Baikal; and has been observed in Egypt, and several parts of Africa north of the equator In Ireland it does not seem to be known. In Britain, especially in the southern counties, it is become rare, though at one time it was evidently abundant. Clusius states, that when he was in London an amazing number of kites flocked there for the offals which were thrown into the streets. They were so tame, that they took their prey in the midst of crowds, and it was forbidden to kill them. In falconry it was used both as pursuer and pursued, and is very docile. A good instance of this docility is given by Mr. Thompson in the 'Magazine of Zoology and Botany,' vol. ii., p. 172. Louis XVI. fled at the kite with powerful falcons; and Sir John Sebright tells us, that 'Fork-tailed kites were much flown some years ago by the earl of Orford, in the neighbourhood of Alconbury Hill. A great owl, to the leg of which the falconers usually tie a fox's brush, not only to impede its flight, but to make it, as they fancy, more attractive, is thrown up to draw down the kite.'

Colonel Sykes notes *Milvus Govinda* as occurring both in South Africa and India. In the catalogue of the South African Museum is the following account of *Milvus parasiticus*, the *Cape Kite*, there preserved. 'This bird is the *Kuicken Deif* or Chicken-stealer of the Dutch colonists, and only appears in South Africa during the summer season. It resorts to inhabited places, and, as its name implies, is very destructive to young chickens. Everywhere it is bold; but it is especially so in districts into which fire-arms have not as yet been introduced, where it will pounce down and seize pieces of flesh from the hands of children, or even grown persons. It feeds in part upon carrion, and many individuals are often seen congregated together upon dead carcasses.'

General Geographical Distribution of the Falconidæ.—Wherever birds and small quadrupeds are to be found there is the bird of prey, whose office it is to keep their number within their proper bounds. Thus, as Mr. Vigors writes (*Zool. Journ.*, vol. i., p. 329—*On the Groups of the Falconidæ*), there seem to be no limits affixed to the geographical distribution of the true *Falcons*. This indeed appears generally the case in the larger groups of this family. The naked-cheeked *Falconidæ* alone seem to be confined to the southern parts of the New World, and to Australia, if we are to refer *F. Novæ Zælandiæ* of Dr. Latham to the genus *Polyborus*, according to M. Temminck's opinion But the remaining groups appear to be dispersed in every division of the globe.

The *Falconidæ* described and figured in Mr. Swainson's 'Birds of Western Africa,' before alluded to, belong to the two most typical or perfect divisions of the family, viz. the noble falcons (*Falconidæ*), and the hawks (*Accipitrinæ*).

Some of the best illustrations of the *Falconidæ* will be found in Audubon, Bewick, Gould, Le Vaillant, Temminck,

Savigny, Swainson, Vieillot, and Yarrell. Some of Frisch's figures are good. There are many fine and expensive works (the 'Planches Enluminées, for example) which contain figures of these noble birds, but they are sadly deficient in character, and look like what they were mostly taken from, ill-stuffed specimens. There is more to be learnt from the wood-cuts of the heads by Swainson in 'Fauna Boreali-Americana' and the 'Classification of Birds,' than from the most gorgeously coloured ill-shaped engraving. The magnificent works of Audubon and Gould are full of the character of the respective species: Swainson particularly excels in this, whether he pourtrays the bird in his beautiful drawings, or gives an epitome of its leading points in the small compass of a wood-cut. The figures in Yarrell's 'British Birds' are excellent, and charming examples of the perfection to which wood engraving can be carried.

Fossil Falconidæ.

Dr. Buckland notices the remains of *Falconidæ* in the 1st period of the Tertiary series (Eocene period of Lyell), and figures a *Buzzard* (*Buteo*), as recent and fossil, in the first plate of his Bridgewater Treatise.

FALCONRY, or HAWKING, the art of training and flying hawks to take other birds. Julius Firmicus, who lived in the middle of the fourth century, is the first Latin writer who speaks of falconers and the art of teaching one species of bird to fly at and catch another. The art, however, had been, in all probability, practised in the East from remote ages; whence it certainly came to Europe.

From the Heptarchy to the time of Charles II. falconry was the principal amusement of our ancestors in England: a person of rank scarcely stirred out without a hawk upon his hand, which, in old illuminations and upon antient seals, is the criterion of nobility. Harold, afterwards king of England, is thus represented in the Bayeux tapestry, when visiting the court of William duke of Normandy.

Florence of Worcester (4to. edit. 1592, p. 310) states that King Alfred had his falconers among the persons whom he encouraged for their skill in different professions; and a metrical treatise on the art of falconry, still extant, is ascribed to King Edward the Confessor.

In 'Domesday Book' the practice of falconry is illustrated by numerous entries. In several places we find a sum, no less than ten pounds, made the optional payment instead of finding a hawk (*Domesd.* tom. i. fol. 134, b. 172, 230); and once, at Worcester (tom. i. 172) a Norway hawk is specified. Aeries, or places destined for the breeding or training of hawks, are entered in the Survey in Buckinghamshire, Gloucestershire, Worcestershire, Herefordshire, Shropshire, and, more frequently than in other counties, in Cheshire; as well as among the lands between the Ribble and the Mersey. (*Ibid.* tom. i. fol. 144, 152, 163 b, 172, 180, 252 b, 256 b, 257, 264, 265, 265 b, 266 b, 267, 267 b, 268 b, 269, 270.)

Nor were hawks less prized at subsequent periods. According to Madox (*Hist. Excheq.* i. 273), in the 14th Hen. II., Walter Cnot, one of the king's tenants, rendered his rent at the exchequer in three hawks and three girfalcons. King John had also his hawks (*Pat.* 4, *Joh.* m. 2); and upon the Patent Roll of the 34th Hen. III. a copy occurs of the letter which the king sent in that year to the king of Norway for hawks. Bray, in the 'History of Surrey,' (vol. iii., p. 82,) relates a curious anecdote of Henry III.'s anger with one Roger Belet, who by reason of something he had done or omitted about a spar-hawk, was disseised of all his lands and 40*s.* rent in Bagshot. In the 34th Edw. III. it was made felony to steal a hawk; to take its eggs, even in a person's own ground, was punishable with imprisonment for a year and a day, besides a fine at the king's pleasure. In Queen Elizabeth's reign the imprisonment was reduced to three months; but the offender was to find security for his good behaviour for seven years, or lie in prison till he did. (Pennant, *Brit. Zool.*, 8vo. Lond. 1812, vol. i., p. 212.)

Edward III., according to Froissart (*Chron.* i., c. 210), had with him in his army, when he invaded France, thirty falconers on horseback, who had charge of his hawks; and every day he either hunted or went to the river for the purpose of hawking, as his fancy inclined him. Queen Elizabeth is represented enjoying this sport in a wood-cut in Turbervile's 'Falconry,' published in 1575; and it was the favourite amusement with King James I.

By an entry upon the Originalia Rolls of the 35th Edw III. (*Origin.*, vol. ii., p. 267) it appears that a falcon gentil cost 20*s.*, a tersil gentil 10*s.*, a tersil lestour 6*s.* 8*d.*, and a lanner 6*s.* 8*d.*: these were the prices which the sheriff was to give for hawks for the king's use. In an account-book of the 20th Hen. VIII. a goshawk and two falcons are prized at 3*l.*, and five falcons and a tersil at 8*l.* Bert in his Address to the Reader, prefixed to his 'Treatise of Hawkes and Hawking,' published in 1619, says he 'had for a Goshawke and a Tarsell a hundred marks.'

Falconry was attempted to be revived by George Earl of Orford, who died in 1791; and in Yorkshire Col. Thornton had a hawking establishment at a rather later period; Sir John Sebright and a few other gentlemen also practised it in Norfolk at the beginning of the present century. As a rural diversion however, principally in consequence of the enclosures, it has gone into disuse.

A list of the hawks which were most used by sportsmen in the time of Charles I. is given in Walton's 'Complete Angler;' and an explanation of the words of art in hawking will be found in Latham's 'Falconry,' 4to., Lond. 1633.

The earliest printed treatise on hawking in English is the 'Book of St. Alban's,' fol., 1481, ascribed to Juliana Barnes or Berners, abbess of Sopwell. [BERNERS.] There are numerous other and curious treatises upon falconry both in French and English, some of them of very rare occurrence. 'Le Miroir de Phebus, avec l'Art de Fauconerie,' published at Paris in 8vo. without date, was the first work upon the subject printed in the French language.

For further information upon Falconry and its practice, the reader may refer to Spelman's *Glossary*, v. 'Acceptor,' edit. fol., Lond., 1626, p. 7; Warton's *Observ. on Spenser's Fairy Queen*, vol. ii., p. 171—173; Strutt's *Sports and Pastimes of the People of England*, 4to., Lond., 1810, pp. 21—33; and Haslewood's *Literary Researches into the History of the Book of St. Alban's*, 4to., Lond., 1810, pp. 21—48 [FALCONIDÆ.]

FALCU'NCULUS. [LANIADÆ.]

FALKIRK, a considerable market, post-town and parish, in Stirlingshire, 24 miles west by north of Edinburgh, and 12 miles south by east of Stirling. The parish is nearly seven miles in length by about four in breadth, and the whole is perfectly level, except that part on which the town stands. It is bounded on the north by the river Carron, which gives name to the celebrated iron works, situated near the fertile tract called the 'Carse of Falkirk.' The town is thriving and increasing in trade and population. It consists of one long street, called High-street, extending about half a mile, and is lighted with gas. It is situated in a wealthy and densely peopled district, in the midst of collieries and manufactories, and is the chief town in the eastern part of Stirlingshire. The extensive suburbs comprise the villages of Lauriston, Grahamstown, Bainsford, and Camelon, together with the seaport town of Grangemouth. These suburbs owe their rise to the great canal passing through them, and to their being in the vicinity of the Carron works, which are only a mile distant from the canal, and which have a railway communication with the basin in Bainsford. The town-house is situated in the middle of High-street, and in this quarter both the houses and shops are large. The new church has a fine steeple 130 feet in height. The old church was a very ancient structure, and built in the form of a cross. According to an inscription that was discovered when taking it down in 1810, it appears to have been founded by Malcolm III. in 1057. In the church-yard were interred Sir John Graham and Sir John Stewart, who were killed at the battle of Falkirk, 22nd July, 1298, while defending the independence of their country under Wallace against Edward I. On each side of the High-street narrow and confined streets branch off, one of which extends upwards of a mile towards Carron, passing through Bainsford and Grahamstown. On the banks of the canal are large corn-mills, a foundry, and a distillery. There are also some extensive tar works in the neighbourhood. The market-day is Thursday, and the trysts or cattle fairs are held three times a year, when black cattle, principally for the English markets, and likewise sheep and horses, are exposed for sale to a very great amount. Indeed this is the largest cattle market in Scotland. The town of Falkirk was formerly a burgh of regality; it afterwards became a burgh of barony, and was held of the family of Livingstone till the attainder,

in 1715, of the earl of Linlithgow and Callander, by whose forfeiture his estates and superiorities became vested in the crown. In 1720 the estate of Callander was purchased by the York Buildings Company, from whom, in 1783, it was acquired by the late William Forbes of Callander, the father of the present occupier. During the time the estate was held by the York Buildings Company there was always a resident baron-bailie; and Mr. Forbes continued to name a person to that office till about the end of the last century. Since then the office has been vacant.

The management of the affairs of the town and community is at present vested in two separate bodies, the stent-masters and committee of feuars. The stent-masters are elected annually, and are twenty-four in number; four being chosen by the merchants, two by each of the trades or guilds of hammermen, wrights, weavers, shoemakers, masons, tailors, bakers and brewers, and four from the suburbs of the town. Any person belonging to any of these trades is qualified to vote for and to be elected a stent-master of his craft. By the act 3 and 4 William IV., c. 77, the town of Falkirk obtained a municipal constitution. The council consists of a provost, three bailies, a treasurer, and seven councillors. According to the population returns for 1831 the burgh and parish of Falkirk contained 12,743 persons. It returns a member to parliament in union with the burghs of Lanark, Linlithgow, Hamilton, and Airdrie. The debt of the town is 1700*l.*, its revenue about 200*l.*, and annual expenditure 174*l.* The patronage is in the crown. Near Falkirk the Pretender gained a victory over the royal army on the 17th of January, 1746. Here also is a part of the Roman wall, known by the name of 'Graham's Dyke,' built in the time of the Emperor Antoninus Pius. The grammar and English schools of Falkirk are in high repute: they are all private except the parish one, the master of which is appointed by the heritors. (Playfair's *Description of Scotland; Sinclair's Statistical Account of Scotland; Boundary Reports; Municipal Corporation Reports*, 1835; *Population Returns.*)

FALKLAND, HENRY CARY, VISCOUNT, descended from the Carys of Cockington, was the son of Sir Edward Cary of Berkhamsted and Aldenham in Hertfordshire, at which latter place he was born late in the reign of Queen Elizabeth. When about sixteen years of age, he was sent to Exeter College, Oxford; but he left that university without taking a degree. In 1608 he was made one of the Knights of the Bath, at the creation of Henry, Prince of Wales; and in 1617 was sworn in Comptroller of his Majesty's household, and made one of his privy council. On the 10th November, 1620, he was created Viscount of Falkland, in the county of Fife, in Scotland. King James I., knowing his abilities and experience, constituted him Lord Deputy of Ireland, into which office he was sworn September 18th, 1622, and continued in it till 1629. During his administration he is said to have kept a strict hand over the Roman Catholics in that kingdom, which gave them occasion to send complaints to the court of England against him, till, by their clamour and prevailing power, he was removed in disgrace. Leland in his 'History of Ireland,' has given the character of his government. 'Lord Falkland,' he says, 'seems to have been more distinguished by his rectitude than abilities. In a government which required vigour and austerity, he was indolent and gentle; courting rather than terrifying the factious. He was harassed by the intrigues and clamours of the king's ministers, whom he could not always gratify to the full extent of their desires; his actions were severely maligned at the court of England; his administration in consequence was cautious and embarrassed. Such a governor was little qualified to awe the numerous and powerful body of recusants, relying on their merits, and stimulated by their ecclesiastics to the most imprudent excesses.' Lord Falkland returned and lived in honour and esteem till 1633, in which year, in the month of September, he died, in consequence of having broken one of his legs by an accident in Theobald's Park. Wood includes Lord Falkland among the Oxford writers. The only work of his which was published was a *History of the most unfortunate Prince Edward II.*, edited by Sir James Harrington, in folio and octavo, in 1680. One of his letters is printed in the 'Cabala,' and three or four others remain unpublished in the Harleian Collection of Manuscripts in the British Museum. Lord Orford says he was remarkable for an invention to prevent his name being counterfeited, by artfully concealing in it the successive years of his age, and by that means, detecting a man who had not observed so nice a particularity. (*Biogr. Brit.*, Kippis's edit., vol. iii., p. 290; Leland's *Hist. of Irel.*, vol. ii., p. 474; Park's edit. of Lord Orford's *Royal and Noble Authors*, vol. v., p. 65.)

FALKLAND ISLANDS, The, are a group of islands situated in the southern Atlantic Ocean, between 51° 40′ and 52° 10′ S. lat., and 57° 30′ and 60° W. long. There are two larger islands, called East and West Falkland, and a number of smaller ones, which it is said amount to more than 90. The strait which separates the larger islands is called Falkland or Carlisle Strait, and is from six to ten miles wide. The surface of both islands is calculated to be about 3400 square miles, or about 1000 miles more than that of Devonshire. The northern districts in both islands are rather mountainous, but the highest ground does not much exceed 2000 feet above the sea-level. At the foot of the mountains the plains stretch from five to fifteen miles along the margin of the sea; the southern districts are more level, and hardly contain a hill. The whole coast, especially in the northern districts, is much indented, and contains numerous excellent harbours; among which the most frequented are Berkeley Sound on West Falkland and Port Egmont on East Falkland: both these bays are spacious, of sufficient depth for men-of-war, and have excellent anchoring ground. The climate of these islands does not differ much from that of the British islands. The range of the thermometer is between 26° and 75°; in winter between 26° and 50°, and in summer between 50° and 75°. The weather is rather unsettled. The snow disappears in a few hours, except on the tops of the mountains, and the ice is seldom above an inch thick. Fogs are frequent, especially in autumn and spring, but they usually disappear towards noon. The vegetation is very rapid.

No trees grow on the islands, but wood for building may easily be obtained from the Strait of Magalhaens. Peat and some bushes, which are abundant, supply fuel. Several antiscorbutic plants grow in abundance. The islands contain foxes, but they differ from those of Europe, having a thick head and a coarse fur. Seals are found on the rocks close to the islands. Many black whales are caught in the neighbouring seas. A kind of fish, between the mullet and the salmon, is very abundant, especially in spring. Game is extremely common, especially wild geese and ducks, which are easily tamed. The flocks of gulls and penguins which visit these shores are valuable on account of their eggs.

The Europeans who settled in these islands about the middle of the last century brought with them domestic animals: on their settlements being broken up, the animals remained, and some of them thrive well. There are herds of wild horned cattle and of wild hogs; the horses are of small size, but very hardy, and may be broken in, though with some difficulty. Rabbits are very numerous, of a large size, and have a fine fur.

The soil, especially along the base of the mountains and hills, is well adapted to cultivation, consisting generally of from six to eight inches of black vegetable mould. Wheat and flax have been raised, and potatoes, cabbages, turnips, and other kinds of vegetables, largely and of excellent quality. As to other kinds of produce, the capabilities of the soil have not yet been ascertained. It is probable that even fruit-trees will succeed in sheltered places.

These islands were discovered in 1594 by Hawkins, who called them Hawkins' Maiden Islands, and afterwards again in 1689 by Strong, who gave them the name which they now bear. A French vessel from St. Malo landed here in 1710, and named them Isles Malouines. The French formed a settlement in 1764 on Berkeley Sound which they called St. Louis, but it was given up to the Spaniards in 1767, and some time after abandoned. The English settled in Port Egmont in 1765, but after a few years they were expelled by the Spaniards. A negotiation followed, by which the English recovered possession of the settlement. On this occasion Dr. Johnson wrote a pamphlet about the islands in answer to one of the letters of Junius, in which he depreciated their value as much as Junius had exaggerated it. The English kept possession of this place up to 1774, when it was also abandoned. But when, about the beginning of the present century, the whale-fishery in the seas surrounding the antarctic pole began to become important, these islands again attracted attention, and this interest was still further increased when the commerce with the western coast of

South America was opened to all nations by the navigation round Cape Horn. The English again formed a small settlement in Port Egmont in 1817, principally as a place of refreshment for the whalers. Berkeley Sound, which is better situated for vessels bound round Cape Horn, was settled by a small colony sent there from Buenos Ayres in 1832, but the English government took possession of it soon afterwards. [*London Geog. Journ.*, III. and VI.]

FALL OF BODIES. Under this head we propose simply to explain the laws which regulate the fall of a material substance, supposed either to be allowed to drop or to be projected directly upwards or downwards. The motion of a body projected in an oblique or horizontal direction comes under PROJECTILES, THEORY OF; the nature of the forces which cause the descent or retard the ascent, under ACCELERATION, GRAVITY, &c.; and the circumstances which influence more or less the results about to be specified, under PROJECTILES, RESISTANCES, MOTION OF THE EARTH; MOTION, LAWS OF.

The resistance of the air does not greatly affect the motion of bodies, unless either—1, the bodies themselves be very light, as in the case of feathers, or—2, the velocities be very great, as in that of a cannon-ball. The law according to which this resistance acts is not well ascertained for great velocities; but for moderate velocities it is not far from the truth to say that it is as the square of the velocity: that is to say, whatever resistance there may be to a velocity of 10 feet per second, there is *four* times as much to 20 feet per second, *nine* times as much to 30 feet per second, and so on.

Neglecting the resistance of the air, let us first suppose a body (say a bullet) to be allowed to drop from a height above the earth. The law of its motion is as follows. It acquires velocity uniformly at the rate of $32\frac{1}{6}$ feet per second: that is, at the end of a quarter of a second it is in such motion as would, were the action of the earth to cease, cause it to describe $8\frac{1}{24}$ feet in a second. At the end of one second the rate of motion is $32\frac{1}{6}$ feet per second; at the end of two seconds, $64\frac{1}{3}$ per second, and so on: that is, the fall of a body is a uniformly ACCELERATED MOTION. In the article just cited the law of this motion is further explained. We shall here collect the principal formulæ connected with the subject, referring to PENDULUM and ATWOOD'S MACHINE, for the manner in which the main fact of the acceleration being $32\frac{1}{6}$ per second is proved and verified.

Let $g = 32\frac{1}{6}$

t = the number of seconds during which the motion has lasted when the body has attained a velocity of v feet per second, and described a length of s feet.

Firstly, suppose the bullet simply to drop without any initial impulse being communicated. Then

$$v = g\,t, \qquad s = \tfrac{1}{2}g\,t^2 = \tfrac{1}{2}v\,t, \qquad v^2 = 2\,g\,s.$$

Thus, either of the three, v, t, s, being given, the others may be found.

Secondly, suppose the bullet to be projected downwards with a velocity of a feet per second; the consequence is still a uniform addition of g feet per second to the velocity, and we have

$$v = a + g\,t, \qquad s = a\,t + \tfrac{1}{2}g\,t^2, \qquad v^2 - a^2 = 2\,g\,s.$$

Thirdly, suppose the bullet to be projected upwards with a velocity of a feet per second. The action of the earth begins by producing a loss of velocity at the rate of $32\frac{1}{6}$ feet lost per second. This lasts until the velocity of the bullet is entirely destroyed, after which it begins to descend without any initial impulse, and we have the first case repeated.

During the ascent,

$$v = a - g\,t, \qquad s = a\,t - \tfrac{1}{2}g\,t^2, \qquad a^2 - v^2 = 2\,g\,s,$$

and the height through which the bullet will ascend is $a^2 \div 2\,g$ feet, the time of doing which is $a \div g$ seconds. After this the first case may be repeated: but this is not necessary; for the preceding equations will continue to represent the relations which actually exist, provided that v, becoming negative, be interpreted as indicating that the turn has taken place and the bullet has begun its descent, and also that s becoming negative be interpreted to mean that the descent has continued until the bullet has passed through the point from which it was first thrown, and fallen below it. For instance (supposing $g = 32$ for simplicity), let a bullet be projected *upwards* with a velocity of 100 feet per second, where will it be, and at what rate will it be moving, at the end of ten seconds?

$v = 100 - 32 \times 10 = -220$, or the bullet is moving *downwards* at the rate of 220 feet per second.

$s = 100 \times 10 - \frac{1}{2} \times 32 \times 10^2 = -600$, or the bullet is 600 feet below the point from which it was thrown upwards.

FALLACY, as defined by Archbishop Whately, is any unsound mode of arguing which appears to carry conviction and to be decisive of the question in hand, when in fairness it is not. Bentham's definition in his 'Book of Fallacies' is this: 'By the name of fallacy it is common to designate any argument employed, or topic suggested, for the purpose, or with a probability, of producing the effect of deception,—of causing some erroneous opinion to be entertained by any person to whose mind such argument may have been presented.' Accordingly if an argument be undesignedly vicious, and without any attempt at deception, it is more correctly termed a paralogism, and it is the intention of fraud that constitutes the fallacy or sophism. There is, however, a legitimate use of fallacy which is too often unnoticed by writers on logic. Thus in modern times Kant has employed the dilemma for a purely scientific purpose; and from the impossibility of two opposite and conflicting cases, has inferred, not as is the usual deduction, that the hypothesis upon which they both rest is false and untenable, but that the truth is intermediate. In like manner did Zeno of Elea infer the inadequacy of sense to represent the truth, from his conclusion that either a bushel of corn must make no noise in falling or else the fall of the smallest portion of a single grain must be perceptible to the ear. Again, the famous 'Megarian fallacies of the Heap and the Bald-head' (acervus calvus), in which it is proved that these notions are incapable of any precise determination, may have been designed to show that the distinctions of degree (here represented by Heap and Bald-head) are unavailable for philosophical purposes, and thereby to call attention to the difficulty of admitting into science the vague representations of sense.

Aristotle in his treatise 'De Sophisticis Elenchis' has laboured to expose and classify the different fallacies which he terms *sophismata* (σοφίσματα). He divides them into those *extra dictionem* (ἔξω τῆς λέξεως) where the fallacy is in the process of reasoning, and those *in dictione* (παρὰ τὴν λέξιν) where it lies in the subject-matter. The former have by the schoolmen been called formal, the latter material. Dr Whately proposes the terms logical and non-logical; which terminology has at least the advantage in a scientific point of view that it excludes from the domain of logic much that is extraneous to it: for the fallacies of form may be reduced to the syllogism with four terms which the analytical process of demonstration can alone discover, whereas those of the matter must be corrected by the formation of valid principles and a correct generalization of terms, which belong to the synthesis of induction, which is totally alien from logic as the science of demonstrative reasoning.

For an enumeration and exposition of the several sophisms see the sections on fallacy in Whately's *Logic;* and for the exposure of that class of fallacies which he has called political fallacies, the work of Bentham already cited, 8vo., London, 1824.

FALLING STARS. [AEROLITES.]

FALLOPIAN TUBES. The Fallopian tubes, so called from the anatomist who first accurately described them, are tortuous and slender membranous canals about three inches in length, which proceed on each side from the two upper corners of the flattened triangular or pear-shaped body of the uterus. They communicate with its cavity by minute openings capable of admitting a large bristle. As they diverge outwards from their origin, they enlarge, and, curving backwards, terminate obliquely in open fringed extremities directed towards the ovaries, which lie below and somewhat behind them. They are included, as are likewise the ovaries, in the duplicature of the peritoneal lining of the abdomen, called the broad ligaments of the uterus, by which that body is itself invested and attached laterally to the cavity of the pelvis. A production of this membrane sheathes them to their loose trumpet-shaped extremities, and turning over the edge is continued for some distance up the interior surface, finally blending with the mucous lining which accompanies them in their exit from the uterus. This is the only instance in the body of the continuity of a serous and mucous membrane, and probably has some concern in the spreading of inflammation from the interior of the uterus to the peritoneum, which constitutes one of the forms of puerperal fever

Before the period of conception these tubes are observed in the lower animals to become more full of blood, and to have a writhing peristaltic motion like that which impels the aliment along the intestinal canal. Certain prominences are also observed at this time on the surface of the ovaries, produced by the maturation and swelling of the *Graafian vesicles*, which are the ova or germs of the future progeny. The Fallopian tubes then become attached by their open fimbriated mouths over these prominences; and receiving the vesicles as they burst through the peritoneal covering of the ovaries, convey them by the peristaltic motion we have mentioned into the uterus.

Whether these germs are always fecundated before they reach their destination is disputed. Such is unquestionably the fact in what is called extra-uterine conception. In these cases the germ never reaches the uterus at all, but remains in the intermediate canal and becomes attached to its surface; in this position it may attain its full size, expanding the tube as it grows, till at length it gives way, and the fœtus escapes into the general cavity of the abdomen Such cases are not necessarily fatal; the fœtus, dead of course, sometimes becomes enclosed after a certain period in a membranous cyst, gradually extended around it from the parietes of the abdomen; and may remain for many years without exciting much irritation. In other instances abscesses form and break in succession, discharging the bones and other unabsorbed parts of the fœtus, and the case eventually does well. But such results are rare; and nothing but the cæsarean operation affords much prospect of saving life.

FALLOPPIO, GABRIELLO, or FALLOPIUS, was born at Modena about the year 1523. He was one of the three distinguished anatomists of the sixteenth century, to whom Cuvier, an unquestionable authority on such subjects, has assigned the merit of restoring, or rather creating their science in its modern and exact form. His associates in this award of praise are Vesalius and Eustachius, the former of whom he succeeded in the united professorships of anatomy and surgery at Padua in 1551. The latter taught at Rome during the same period with less success and perhaps more ability, and their writings indicate some mutual jealousy. [EUSTACHIUS.]

Fallopius appears at one time to have held an ecclesiastical appointment in the cathedral at Modena, which he resigned to devote himself to more congenial pursuits. Having gratified his curiosity by travelling through the most interesting parts of Europe, he settled for a time as a public teacher of anatomy at Ferrara, where he had received a medical education. But he soon quitted that university, which was, in fact, a sphere too narrow for his talents; and had lectured at Pisa for some years with increasing reputation under the patronage of the first Grand Duke of Tuscany [COSMO I.], when he was induced by the liberal proffers of the Venetian senate to repair to Padua to take the place of Vesalius, who had been obliged to resign his academic offices by one of the disastrous incidents which have thrown a romantic interest over the latter part of his remarkable life. [VESALIUS.]

The studies of Fallopius were by no means confined to one department of natural history. He appears to have occupied himself among the rest with the subject of systematic botany, which had very recently begun to attract attention. In this, as in all other steps in the revival of learning, Italy took the lead. The first botanic garden had been established at Pisa by Cosmo de' Medici in 1543, and was at this time under the management of Cæsalpinus. [BOTANY.] The second was established two years later at Padua; and the charge of this garden, with the professorial duties annexed to it, was committed to Fallopius soon after his arrival in that university. The botanical researches and collections he had made during his travels, and his subsequent opportunities at Pisa of access to the best sources of contemporary information, had probably fitted him in no common degree to undertake this additional charge, which he is said to have sustained with great ability and applause. He did not write, and we are not aware that he lectured expressly on the subject of botany as a system; but there are many allusions to it in his works, and among them are several treatises on the preparation and use of various medicinal herbs, as well as of the mineral substances employed in pharmacy.

In addition to his merit as a naturalist and a teacher, Fallopius was an excellent and expeditious operator, and otherwise, for his time, a good practical surgeon. His character with posterity in this respect is somewhat tainted by the appearance of a degree of quackery in the concealment of his remedies, and a trumpeting forth of their virtues which his experience of them could not have justified. But our own age is not so free from the like professional sins, or from the credulity which tempts to their commission, as to make it a matter of surprise that such things were consistent three centuries ago with the high reputation of Fallopius.

After a short but brilliant career of eleven years both in practice and as a teacher, he died at Padua in 1562, and was succeeded by his favourite pupil Fabricius ab Aquapendente.

The only work certainly known to have been revised by himself was a volume entitled 'Anatomical Observations.' It was first printed in 8vo. at Venice, in the year before his death, and has been frequently reprinted. The publication of this work forms an epoch in the science of human anatomy. There is no part of the frame with which the author does not display a masterly acquaintance. Many important parts of it he was the first to describe, if not to observe; and several of them still bear his name. His lectures on pharmacy, surgery, and anatomy were published after his death in various forms and with very different degrees of fidelity by his pupils. The best of them were collected and published with his 'Observations' in three volumes folio, Venice, 1584, and have passed through several editions. They are now superseded by more complete and systematic treatises, and are seldom consulted but by antiquarians in medical literature, or to support novel opinions; for in these sciences, as in others, much that is *new* is likewise old.

FALLOW is a portion of land in which no seed is sown for a whole year, in order that the soil may be left exposed to the influence of the atmosphere, the weeds destroyed by repeated ploughings and harrowings, and the fertility improved at a less expense of manure than it would be if a crop had been raised upon it.

The practice of fallowing land is as old as the Roman Empire. It appears that wherever the Romans extended their conquests and planted colonies, they introduced this mode of restoring land to a certain degree of fertility when exhausted by bearing grain. The principle on which it was recommended was however erroneous. It was thought that the land grew tired of raising vegetable produce and required rest, and hence this rest was often all that constituted the fallow, the tillage, which alone is the improving part of the process, being almost entirely neglected. Where land was abundant and the population thin, it was no great loss to allow a considerable portion of the soil to remain unproductive; and it was cheaper to let land lie fallow during the course of a whole year, which gave ample leisure for every operation, than to accelerate the tillage and increase the manure put upon it. But when land becomes of greater value with the increase of population, it is a serious loss if a great portion of the soil be thus left in an unproductive state. Accordingly the attention of agriculturists has been turned to lessen the necessity of fallows, and to substitute some other means of restoring fertility. It is acknowledged by all experienced farmers that manure alone is not sufficient for this purpose. The ground must be tilled and noxious weeds destroyed; and the only efficacious mode of doing so is to stir the ground at the time when their seeds have vegetated, their roots have made shoots, and before any new seed can ripen. But this is exactly the time when corn is usually growing, and when the land cannot be stirred to expose it to the heat of the sun and to dry the roots which are turned up. The only apparent remedy is therefore not to sow it during one summer, and on this principle lands are usually fallowed. The manner in which this is done has been noticed before [ARABLE LAND]; and the common process is so simple, that provided the purpose of fallowing be kept in view, the operations require only a little attention to time and weather to be performed aright.

There is no difference of opinion respecting the manner of extirpating weeds by repeated ploughing and harrowing, but there is with respect to the influence of the heat of the sun upon the land. Some men are of opinion that light is the great purifier of the soil; that it decomposes certain noxious particles, which are the result of the formation of the seed, and which have been termed the excrements of plants. Physiologists agree that the roots draw the nutritive juices out of the soil, that they undergo a chemical change in the plant, and that there is an exudation also

from the roots, which may be looked upon as the residuum of the natural process. De Candolle, Raspail, and other eminent physiologists have placed this point beyond controversy; but no one has yet been able to collect these matters so as to analyze and compare them; and the reasonings on the subject have been merely conjectural. In particular soils and situations a scorching sun has a pernicious effect on the soil which is exposed to his rays; and where it is shaded by a crop which covers it completely, it seems to have acquired fertility, which the exposed surface has not. But this is not sufficient to establish a general rule. Some soils which are of a wet nature are greatly improved by being as it were baked in a hot sun. Not only are the weeds destroyed by the abstraction of moisture, but the soil thus becomes lighter and more friable. On sandy soils the reverse is the case, and on intermediate loams the effect will be more or less advantageous as they approach nearer to the clay or to the sand. In light sandy soils, then, it is probable that the only advantage of a naked fallow is to kill weeds, especially the couch-grass (*triticum ripens*), which is apt to infest light soils; and that the exposure to the sun in hot weather is not only no advantage, but probably detrimental. If, then, any means can be devised of clearing light lands from weeds without leaving them fallow for a whole summer, a great advantage will be obtained. This has been effected completely by the cultivation of turnips and clover, which was first practised in the light soils of Flanders, and afterwards introduced into the similar soils of Norfolk, from whence it has spread all over Great Britain, and is beginning to be adopted more generally in Ireland. The advantage of the turnip culture is so great in light lands, that it has gradually been extended through the different gradations of loams, till it has reached even the colder and stiffer clays, on which it would at one time have been thought absurd to attempt to raise this root. But this has been attended with an important benefit. It has made the cultivators of heavy soils turn their attention to the drying of their lands, by draining and deep tillage, in order to make them capable of bearing turnips; and although the extended culture of this useful root is not what we should recommend for cold wet clays, we highly approve of all improvements which will make such lands capable of bearing good crops of turnips. Unless the turnips can be consumed by sheep on the spot, or by cattle near at hand, without injuring the land in taking off the turnips and carting on the manure, there will be no great advantage in a crop of turnips; and some other substitute must be found for the occasional fallow before it can be altogether abandoned. On light lands the preparation for the turnips, the abundant manuring, and subsequent hoeing are as effectual in cleaning the land and bringing it into a fertile state as any complete fallow could ever be; and the clover smothers and destroys the seed weeds which may have come up amongst the barley or oats sown after the turnips. There are several ways in which the cultivation of light soils may be varied without adhering strictly to the Norfolk rotation, so as to introduce a greater variety of produce. Tares may be sown on the better sorts of light lands after a good tillage given immediately after harvest. If they are fed off or cut green in May and June, early turnips may be sown after them, which will be fit to feed off or draw for the cows in September; in good time for ploughing up the land for wheat-sowing. In this case the land gets all the ploughing necessary to clean it completely, and exactly at the best time. Three ploughings may be given after the tares if the land is not clean, and the turnips being well hand-hoed and horse-hoed, the land will be perfectly clean to receive the wheat-seed. Manure may be put on for the tares or the turnips; and if these are fed off with sheep, they will so enrich the soil, that the next crop cannot fail to be abundant. By varying the management of light land according to circumstances, and with some judgment, many more profitable crops can be raised than by the common simple rotation, in which a fourth of the land is sown with turnips. If this crop fails, which is often the case where it recurs so often, the whole system is deranged, and the loss is very great. The introduction of a greater variety of produce in the cultivation of light lands, in imitation of the Flemish practice, and the increase of stock kept in consequence, would be an important step in the improvement of British husbandry.

On heavy soils it is often impossible to keep the land clear of weeds, in wet climates and unfavourable seasons, without a complete fallow, and when this is the case it is best to do the thing effectually. Upon cold wet soils, which should always first of all be well under-drained, no pains should be spared to get the land perfectly clean: it should be exposed to the frosts of two winters and the heat of one summer and part of another, as already mentioned. [ARABLE LAND.] Only one crop is lost by this method, and if the land is properly worked, cleaned, and manured in autumn, it may be sown with barley or oats in the spring of the second year. The crop will be ample, and the subsequent produce of clover equally so, and the land so clean, that, with proper manuring, several crops may succeed, such as wheat, beans, oats, tares, wheat, without the necessity of another intervening fallow. The advice we would impress on the minds of the cultivators is—Avoid fallows if you can keep your land clean; but when you fallow, do it effectually, and improve the soil at the same time by chalk, lime or marl, according to circumstances. Do not spare either ploughs or harrows in dry weather. Lay the stitches high and dry before winter, and deepen the water-furrows well with the spade. By following these rules the stiffest land may be brought into a good state of cultivation; and the farmer will not find by the growth of weeds, docks, and thistles, that his labour and manure are thrown away, as is too often the case. Experience has fully proved that the air and the dews impart fertility to the soil, and that land which has been well fallowed and stirred requires less manure than it would otherwise do. Fallowing alone will not make up for want of manure, nor will manuring be sufficient without ploughing and cleaning the land properly, and exposing it to the influence of the atmosphere, especially in autumn and in spring: but a great saving of the one and the other may be effected, by judiciously varying the crops so as to admit of ploughing the land at different seasons of the year.

It is asserted by some old-fashioned farmers that the plough alone is sufficient for all the purposes of fallowing. This is a great error, which leads to useless and unnecessary labour. We would almost say that ploughing the fallows is never necessary, except to enable the drags and harrows to stir the land. The first ploughing of the stubble cannot be too shallow, and the harrows should be set to work before the wet weather sets in. When the surface is become mellow and clean, the land may be ploughed deep, and the soil below should be brought up and exposed to the air and frost all the winter. In spring the drag should begin the work again before the soil is hard. It may then be ploughed in narrow ridges right across the old stitches, or obliquely, and left for the influence of summer. The drags will level all these ridges when the manure is to be put on; and this being ploughed the land is fit to receive the seed, if wheat is the crop intended. If it is left for barley, it must have another ploughing in spring, and be well harrowed before the seed is sown, especially if this is done by the drilling machine. The clover or grass-seeds may be sown immediately after, and the land lightly rolled. There is no danger of making it too fine in spring. Without a fine tilth no good barley can be expected.

FALMOUTH, a parish, borough, market, and seaport town in the county of Cornwall, in the hundred of Kerrier, 54 miles south-west from Launceston and 267 miles west-south-west from London, in 50° 8′ N. lat. 5° 3′ W long. The town is situated at the mouth of the river Fal, whence it derives its name, and consists principally of one street, which extends along the south-western shore of the harbour for about a mile. There is a convenient quay, a town-house, and gaol erected in 1831. The water near the quay is of sufficient depth to allow vessels of considerable burthen to discharge their cargoes on the wharf. Adjoining the principal street and near the centre of it stand the market-house and town-hall. The Public Rooms, a handsome building, is situate in the heart of the town; and not far from it is the polytechnic hall, a spacious and commodious structure, in which are held the annual exhibitions of the Royal Cornwall Polytechnic Society, an institution which, though only established in the year 1833, has always contributed much to promote emulation in the fine and useful arts among all classes throughout the county. The church, which has a handsome altar, was built soon after the Restoration, and dedicated to Charles the Martyr. The average net income of the living is about 300*l*. It is in the diocese of Exeter, and the patron is Lord Wodehouse. There are also places of worship for Baptists, Bryanites, the Society of Friends, Wesleyan Methodists, and Unitarians, a Roman Catholic chapel, and Jews' synagogue, and likewise several schools and numerous cha-

ritable institutions. On the whole Falmouth is a neat and tolerably well-built town. It is lighted with gas, and contains two good hotels. The suburbs are adorned with several villas, which, together with the harbour, when seen from the surrounding hills, have a very beautiful appearance.

The charter of incorporation bears date 13 Charles II. The governing body, under the Act 5 and 6 William IV., c. 76, consists of a mayor, four aldermen, and twelve councillors. The corporation has no revenue whatever; the tolls of the market and the quay are the property of Lord Wodehouse. The only police are the constables appointed by the town councils, these and other expenses being paid by a rate. According to the returns made in 1831 the population of the town and parish of Falmouth was 7284, of which the town alone contained 4761. Falmouth is a parliamentary borough, and in union with Penryn returns two members. The market-days are Tuesday, Thursday, and Saturday, and the fairs are held the 7th August and 10th October.

The harbour, which is extensive and well protected by the surrounding high lands, is so conveniently situated that vessels have frequently been able to proceed on their voyage from this port, while those from Plymouth and Portsmouth have been forced back by contrary winds before they could reach the mouth of the Channel. It is defended by two castles; one, towards the west, called Pendennis, and the other, towards the east, called St. Mawes. Carew, in his 'Survey of Cornwall' (London, 1602) states that both these castles were built by Henry VIII., and subsequently improved and strengthened by Queen Elizabeth. Pendennis long resisted the attacks of Oliver Cromwell, whose lines of encampment may yet be seen. It now contains commodious barracks, storehouses, and magazines, with apartments for the lieutenant-governor. A light-house has recently been erected at St. Anthony's Point, at the east side of the harbour. The Trinity Board have recently directed the building of an obelisk on the height of the Black Rock, between Pendennis and St. Mawes, for the assistance of mariners in making Falmouth harbour. Formerly there was an extensive fishery in pilchards, and large quantities were annually exported. It has been stated that of late years this fish has become particularly scarce, though from the account given by Mr. M'Culloch of the present state of the fishery on the coast of Cornwall, there appears to be little or rather no foundation for such an assertion. The exports consist principally of the produce of the tin and copper mines: the trade with Jersey in fruit and cyder is considerable. The port is first spoken of in the reign of Henry IV., when the duchess dowager of Bretagne landed here, in progress to celebrate her nuptials with that king. Until 1613 the site of the present town was occupied merely by the huts of fishermen. There was however one house of entertainment, at which Sir Walter Raleigh and his crew put up on their return from Guiana. Shortly after this period Sir John Killegrew, bart., an enterprising individual, having obtained permission from James I., constructed a new quay, laid the foundation of the present town, and procured an act of parliament, by which the payment of certain duties was secured to himself and heirs. The subsequent establishment, about 1688, of the post-office packets to the West Indies, Lisbon, &c., contributed much to the rising prosperity of the place. In 1700 there were 350 houses, in 1750 upwards of 500, and in 1811 there were 647 inhabited houses in the town and suburbs. Large amounts of specie and bullion are landed from the packets arriving from Spain, Portugal, and America. The steamers which run between London and the Mediterranean invariably call here on their outward and homeward passage to take in passengers and coals; and the Peninsula Steam Navigation Company, having recently contracted with government to carry the mail, one of their powerful vessels now leaves the port every Monday. This alteration in the conveyance of the mail had long been felt necessary by merchants connected with the Peninsula. About the middle of the entrance to the harbour is a large rock called the Black Rock, which is traditionally said to have been the island where the Phœnicians trafficked with the natives for tin. Borlase, in his 'Antiquities of the County of Cornwall,' mentions the finding of a large quantity of Roman coins on a branch of Falmouth harbour, nearly the whole of which were of the coinage of the Emperors Gallienus, Carinus, and Numerian, who reigned A.D. 259—284. At the western extremity of the town stands Arwinnick-House, the antient seat of the Killegrew family

(Borlase's *Antiquities of Cornwall*; Carew's *Survey of Cornwall*; M'Culloch's *Commercial Dict.*; *Boundary Reports*; *Municipal Corporation Reports*; *Population Returns*; *Ecclesiastical Revenue Reports*.)

FALSE POSITION, a rule of arithmetic, which, though originally applied to such questions as are soluble by equations of the first degree, has been in modern writings, and upon principles explained in APPROXIMATION and INTERPOLATION applied to equations of all degrees. It is however of very little use, though of some notoriety, and a general explanation will be sufficient.

Let there be a function of x, ϕx, which it is desired to make equal to a, and firstly, let this function be such that successive *equal* increments added to the value of x produce successive *equal* increments (or decrements) in the value of ϕx (which is, in fact, supposing that ϕx is of the form $mx + n$): assume two values for x, p, and q, and let the corresponding values of ϕx be P and Q. If then (to use the easiest form of speech) a uniform increase of x is accompanied by a uniform increase of ϕx, and if x represent the value which makes ϕx equal to a, it follows that the interval between P and Q bears to that between p and q the same proportion as the interval between P and a bears to that between p and x. Or x can be obtained from the proportion

$$\mathrm{P}-\mathrm{Q} : p-q :: \mathrm{P}-a : p-x$$

If the preceding be not easily understood, the same proportion may be immediately deduced from

$$mp + n = \mathrm{P},\ mq + n = \mathrm{Q},\ mx + n = a$$

which follow from the several hypotheses made.

When ϕx and x do not increase uniformly together, it is nevertheless true that they do so *nearly* when the successive increments added to x are very small. If then p and q can be found so that P and Q are near to a, the use of the preceding proportion will produce a value of x which is nearer the truth than either p or q, and may be substituted for either in a repetition of the process, which will then produce a still nearer value.

The rule of False Position, as thus extended, is simply Newton's well-known method of approximating to the roots of equations, with this difference, that instead of the differential co-efficient of ϕx, the approximation $(\mathrm{P}-\mathrm{Q}) \div (p-q)$ is used. The equation of the first degree is one in which either method will bring an accurate result in one process; but the notoriety of the rule of False Position arose out of its appearing that a couple of errors, or wrong solutions, were made infallibly to give the right result: and thus it is that Recorde says he can solve mathematical questions by taking the answers of any children or idiots who may be in the room. To persons ignorant of algebra there seems to be a mystery in the being able to make any two guesses, however remote, to discover the truth. Thus, what is that number whose half, third, and fourth, together with 10, make 62? Make any guess, say 12: the half, third, and fourth of 12, together with 10, make 23, which is wrong. Make another guess, say 60, which produces 75, also wrong. The difference of the wrong results, 75—23 or 52, bears to the difference of the wrong assumptions, 60—12, or 48, the same proportion as the excess of the result 75 over 62 (the required result) bears to the excess of 60 over the truth. But 52 : : 48 13 : 12, or 12 is the excess of 60 over the truth, that is, the true answer is 48, as may easily be verified.

Where the equation is of the form $mx = a$, one guess only will suffice. If the assumption of p give P, or if $mp = \mathrm{P}$, then $\mathrm{P} : p :: a : x$

FALSETTO, in Music, an Italian term, signifying a false or artificial voice, produced by tightening the ligaments of the glottis, and thus the vocal compass is extended about an octave higher. The Italians call the falsetto *voce di testa*, or voice from the head; the natural voice *voce di petto*, or voice from the chest.

FALSTER, a Danish island in the Baltic, due south of Seeland, and east of Laaland or Lolland; between 54° 30′ and 54° 58′ N. lat., and 11° 45′ and 12° 11′ E. long. The strait called the Gaabensesund separates it from Seeland, and the Goldburgsund from Laaland; on the north-east, the Groensund divides it from the island of Moen. Its greatest length from north to south is about 25 miles, and its greatest breadth from east to west is about 16 miles. The area is about 177 square miles, and the population about 17,500; in 1801 it was 15,548. It forms the eastern part of the circle or 'stift' of Laaland or Falster. It lies higher than Laaland, has better water, and a healthier at-

mosphere, and is accounted one of the best cultivated and most productive parts of the Danish dominions. The surface is level, and in the south the island terminates in two long tongues of land, formed by an arm of the sea called the Noret. The western tongue of land has a lighthouse upon it, beyond which a reef of rocks extends far into the sea. The soil is equally fertile with but less swampy than that of the other Danish islands near it: the produce of grain is more than adequate to the consumption, so that between 30,000 to 35,000 quarters are annually exported. Flax and hemp, hops, potatoes, and other vegetables, are grown. Large quantities of fruit are raised, and apples in particular are a considerable article of exportation. The woodlands occupy about one-sixth of the whole surface. Horned cattle and a native race of sheep are bred, and the forests afford food for a great number of swine. Much wax and honey are obtained; and poultry, geese especially, are abundant. There are no rivers but the Aar, an inconsiderable stream, and the short river through which the Mariboersee, a large lake, has an outlet into the sea. There are no manufactories in the island; and the people make their own clothing, stockings, and brandy. The principal imports are colonial produce, salt, and tobacco; and the exports are grain, salt meat, butter, fruit, live cattle, potatoes, &c. There is some ship-building.

Falster is divided into two districts, the North and South Hardes, and contains 28 parishes, 2 towns, and 107 villages and hamlets. Nykioebing, the chief town, is situated on the western side of the island upon the Goldborgsund; it is a pleasant well-built place, has some traces of its former fortifications, contains a cathedral and church, several schools, a town-hall, a hospital, about 250 houses, and a population of about 1600. There is an antient castle, in which several dowager queens of Denmark have resided, called Norre Ladegaard. The situation of this town is so picturesque, that it has been termed the northern Naples. It has a good corn trade. Stubbekiobing, the other town, is an inconsiderable place on the Groensund in the north-east, opposite the island of Baagoe; it is surrounded by walls, and has eight streets, a church, a school, and poor-house, about 130 houses, and about 700 inhabitants.

FALUN, a town in Sweden, the capital of the province of Dalecarlia, and of the Län of Kopparbergs, lies in 60° 35′ N. lat. and 15° 35′ E. long. The population is about 4000 or 4500. The town is built in a wide valley between two lakes, which are not far from it. It is celebrated for the great mine of copper which is in the middle of the town. Unlike all other mines, this is an immense abyss, about 1200 feet long and as many wide, into which people descend by a staircase to a depth of 1200 feet; the ore is detached by the miners from the bottom of this hole, so that they are not obliged to use candle-light. The vapours which continually rise from the mine have destroyed every trace of vegetation in the neighbourhood, and even wild animals and birds are rarely seen. The annual produce of this mine is from 4000 to 4500 skippounds of copper. It also produces gold to the annual value of from 200 to 300 ducats, silver from 400 to 500 marks, lead from 100 to 150 skippounds, vitriol from 600 to 800 tons, ochre about 1000 tons, and brimstone from 20 to 30 skippounds. The copper is sent to Avestad to be refined and worked up. There are a few manufactures of linen, cotton and wool, but all on a small scale.

FAMAGOSTA. [Cyprus.]

FAN PALM. [Chamærops.]

FANARIOTES, a name applied to the inhabitants of the Fanar, or Greek quarter of Constantinople. After the capture of Constantinople by the Turks, the Greeks of the Fanar, taking advantage of the ignorance of the Turks, succeeded in rendering themselves necessary to the ministers of the Porte as translators, and to other Turkish grandees as secretaries, agents, and men of business in general. They were all comprised under the general denomination of Grammatikoi, clerks or scribes. At first they were not distinguished from common servants; and the office of the translator to the Sublime Porte conferred no consideration on the individual who held it. The Greek translator explained to the Turkish ministers the contents of a foreign dispatch, after which he retired into the great hall of the palace, where he waited with other menials till his masters might want him.

In the year 1669, under the reign of Mahomet the Fourth, a Greek called Panayotaki persuaded the Turkish divan that the interests of the Sublime Porte would be much better served by an official interpreter, honoured with the full confidence of the government, than by the ordinary translators who had hitherto been employed. The government acted on this suggestion, and Panayotaki was nominated dragoman of the divan, or translator to the council of the state. The successors of Panayotaki continued to enjoy the advantages conferred on their predecessor, which were gradually enlarged. From that time the ambition of the Fanariote families became entirely turned in that direction, and they instructed their children in the Turkish, the Italian, and French languages, in order to enable them to discharge the duties attached to the office of the dragoman.

In the progress of time the divan created another dragoman, who was called the dragoman of the fleet, whose duty was to accompany the capitan pasha, or grand admiral, on his annual tours in the Archipelago for the collection of taxes. Although the office of the dragoman of the fleet was much less important than that of the dragoman of the divan, it was more lucrative, being estimated at about 300 purses, while the fixed salary of the dragoman of the Porte did not exceed 94 purses. The dragoman of the fleet exercised an almost unlimited power over the islands of the Archipelago, which, with the exception of Cyprus and Candia, were governed by officers called mooselims, chosen by the capitan pasha, and renewed every year. The dragoman of the fleet always purchased the appointments to those offices, which he resold with considerable profit. The capitan pasha never acted without the advice of the dragoman, who even frequently acted as his master's deputy in the collection of taxes from the above-mentioned islands. The Fanariotes, thus invested with the office of dragoman of the divan, being the only agents of communication betwixt the Porte and the European governments, necessarily acquired a great influence over the Turkish government, and they took good care to turn it to their own advantage. In the beginning of the eighteenth century the Fanariotes succeeded by their intrigues in prevailing on the Turkish government to choose from among them the Hospodars or princes of Moldavia and Wallachia, which dignities had been hitherto bestowed on natives of the above-mentioned provinces.

Maurocordato was the first Greek who was nominated Hospodar of Wallachia in 1711. A crowd of Fanariotes always followed the new Hospodars, who employed them in different offices in their respective provinces, where they became notorious for their unprincipled exactions, employing every means, however odious, to acquire as much wealth as possible during their short and precarious tenure of office. The Hospodars, who partook of this ill-gotten wealth, countenanced and protected them in all their proceedings. The mode of government has been since changed in the above-mentioned provinces of Moldavia and Wallachia.

The offices of the dragomans and the principalities of Moldavia and Wallachia were not the only sources of wealth to the Fanariote families: the bankers of the Fanar disposed of the greater part of the military and civil appointments in the Ottoman empire. Although precluded by their religion from holding any of those offices, they purchased the appointments to them from the grand vizier at a high price; and the Turks who wished to be invested with the command of a fortress, the government of a province, on any other similar charge, could find at the confidential banker of the vizier the firmans or nominations for the desired places, with the name left in blank. The purchaser entered into an arrangement with the banker, who filled up the blank with his name, and commissioned one of his Greek agents to accompany the new governor to his province, which he administered in his name, and collected from the revenue the sums advanced by the banker to the grand vizier with the most usurious interest. Many judicial appointments of the Turkish empire were also purchased by the bankers of the Fanar, and resold at a considerable profit. It is superfluous to add, that this system led to general oppression, and the most venal administration of justice. Besides this infamous traffic in public offices, the Fanariotes conducted almost all the private affairs of the Turkish grandees. They purchased, sold, and managed their estates, which the supineness and ignorance of the proprietors entirely abandoned to their care. The profits which they realized from such transactions generally amounted to from forty to fifty per

cent. An interesting picture of the Fanariotes is given in Mr. Hope's celebrated novel 'Anastasius; or, the Memoirs of a Greek;' as well as in the 'Essai sur les Fanariotes,' by Marco Zallony; and in a work published by Von Hammer, called 'Constantinople and the Bosporus.'

The events which have followed the last Greek revolution have considerably diminished the importance and altered the position of the Fanariotes.

FANCY, a corruption of phantasy (φαντασία), which term in antient philosophy indicated the sensuous appearance of an object, and in a general sense was used as co-extensive with conception, or the faculty by which man reproduces images of objects either absent or present, without an immediate impression on the organs of sensation. In later times its signification has been greatly narrowed, and it is now limited to a particular province of the imagination, with which, however, it is often frequently confounded in loose and inaccurate language, and to which it is employed as equivalent. Imagination differs from conception either by the greater distinctness and vividness of its images, or else by combining the manifold materials of experience into a new and true unity. In the former case it is merely reproductive; in the latter creative, and becomes fancy:—

> 'Of all external things
> Which the five watchful senses represent
> She forms imaginations, aerie shapes.
> MILTON, Par. Lost, v.

Fancy is a higher energy of the mental activity than imagination simply, but is nevertheless dependent upon it, since it is the latter that furnishes the materials out of which it creates its phantasies either by modifying or exaggerating them, or by forming new combinations, and by a prosopopœia investing its personification with the properties of real beings. Imagination is necessary to authors generally, but both imagination and fancy to the poet; the latter presenting him with those lofty speculations which comprise what has been termed the ideal of art, and furnishing the link for that enchainment of his ideas which, rejecting the restraint of all general laws, is wholly dependent upon the peculiarities of the poet's mental temperament.

FANDANGO, a quick dance in 3/8 or 6/8 time, universally admired and practised in Spain, and supposed to be of Moorish origin; though Volney ascribes much higher antiquity to it, believing it to have come originally from Carthage, thence to Rome, and so into Spain. The probability however is that it was brought into Europe by the Arabians, to whom certainly it may have been transmitted from very remote ages. Like many other dances, this is performed with more or less propriety according to the degree of delicacy possessed by those who practise it.

FANO. [URBINO E PESARO.]

FANOE. [DENMARK, vol. viii., p. 398.]

FANSHAWE, The Right Honourable Sir RICHARD, was the youngest son of Sir H. Fanshawe, and was born in 1608, at Ware Park, in the county of Hertford. He became a fellow-commoner of Jesus College, Cambridge, in 1623, and removed to the Inner Temple in 1626. On the death of his mother, who had long survived his father, he betook himself to travel, and visited France and Spain. He was subsequently appointed secretary to the embassy at Madrid, and was left resident there till 1638. After his return, and on the breaking out of the civil war, he declared himself a royalist, and attended the court at Oxford, where he received the degree of Doctor of Civil Law. He followed the prince of Wales to the islands of Scilly and Jersey in the capacity of secretary, and in 1648 became treasurer to the navy under Prince Rupert. At the battle of Worcester he was taken prisoner, but contrived to be released, and repaired to Charles II. at Breda, who appointed him master of requests and his Latin secretary. He returned to England with Charles, represented Cambridge in 1661, and was employed in negotiating Charles's marriage with Catherine. He was sent as ambassador to Philip IV. of Spain in 1664, and died at Madrid in 1666, leaving a widow and five children. His body was sent home embalmed.

Notwithstanding the active life of Fanshawe, he found leisure to attend to literature, and produced several works, the most celebrated of which is a translation of Guarini's 'Pastor Fido.' The parts of this work written in heroic measure are harsh and ill-managed, but the lighter lyric passages are playful and often melodious, and some of the more sublime choruses are sonorous and majestic. This book is not very easily procured. It was published in 1664, and is adorned with a curious portrait of Guarini.

FANTEES, or FANTINS, a nation inhabiting a part of the Gold Coast in Western Africa. The country of the Fantees is bounded by Acron on the east, and by Sabo, from which it is divided by the Iron Mountain, about three miles east from Cape Coast Castle, on the west. Its entire length, according to Bosman, is nine or ten miles. The capital, called Fantin, is placed about fifteen miles inland, but all the other towns of note lie along the sea-coast. Taking them in their order from east to west, the principal are:—Manfro, Laguyo, Aqua, Cormantin, Ameisa, the Lesser Cormantin, Aga or Adja, Annamaboe or Jamissia, and Anikan or Ingenisian. At many of these places the Dutch, Danes, Portuguese, and English, used to have forts or factories. The natives are described as principally employed in fishing. The government antiently seems to have been less of a despotism than that of most of the surrounding nations. 'Here,' says Bosman, 'is no king, the government being in the hands of a chief commander, whom they call their Braffo, a word importing leader. He is a sort of chief governor, and has the greatest power of any in the whole land, but is somewhat closely restrained by the old men, who are a sort of national counsellors, not unlike some European parliament, acting perfectly according to their inclinations, without consulting the Braffo. Besides these, every part of Fantyn hath also its particular chief, who will sometimes scarce own himself subject to the Braffo, who hath the ineffectual name only of supreme power.' Since the commencement of the present century the country of the Fantees has been overrun by the Ashantees, and its recent history will be found in the article on that people. [ASHANTEE.]

FARCE. [ENGLISH DRAMA, vol. ix., p. 417.]

FARIA E SOUSA, a Portuguese escudero, and a writer on various subjects, chiefly in the Spanish language, was born in 1590, in a country residence called Caravella, in the province of Entre Minho e Douro. His talents were so precocious, that in 1600 he attended the lectures of his father and others at the university of Braga, and soon after, being desirous to become familiar with the Greek and Roman classics, he repaired, in 1604, to the learned Gonçalo de Moraes, bishop of Oporto. This new tutor soon appointed him his secretary, notwithstanding Faria's constant rejection of all offers of preferment on condition of entering the church, and notwithstanding his consecrating the first essays of his muse to his mistress Amelia. This lady was probably the same Donna Catalina Machado whom Faria married in 1614, whose stoical calmness in a tremendous storm at sea he celebrated in his 'Fuente de Aganippe' (Od. ii. part 3). In 1619 Faria quitted Portugal to try his fortune at the Spanish court; but his independent character prevented his success, and he returned to Portugal. Being unable to improve his prospects in Portugal, he once more resorted to Madrid, and at last in 1631 obtained the secretaryship to the Spanish embassy at Rome under the marquis of Castel Rodrigo. Although he attracted the notice of the Italian literati, and even numbered Pope Urban VIII. among his patrons, Faria could not agree with the marquis, and returned to Spain in 1634. After many sufferings, proceeding from the resentment of this personage, he was allowed at last to settle as a prisoner at Madrid, where, abandoning all thoughts of advancement, he devoted the remainder of his life solely to letters with such ardour as to hasten his death, which took place on the 3rd of June, 1649.

Faria adhered closely to that extravagant school which in Spain was fostered so much by that of the Martinists in Italy. He revelled in bold flights of fancy, but all his beauties are like flowers buried in parasitical weeds. He wrote daily, as he says himself, twelve sheets; and moreover had such facility in rhetorical turns and flourishes, that in a single day he could compose a hundred different addresses of congratulation and condolence. On the other hand, his historical works, which are written in Spanish, are still valuable for their subject-matter. The rest of his works are not all in that language, as we find it stated in the 'Biographie Universelle.' Out of his select 600, or, as he terms them, 'six centuries,' of sonnets, exactly 200 are in Portuguese, and twelve of his eclogues are also in that language.

His works are:—1st. Noches claras, o Discursos morales y politicos. 2nd. Comentarios sobre la Lusiada, on

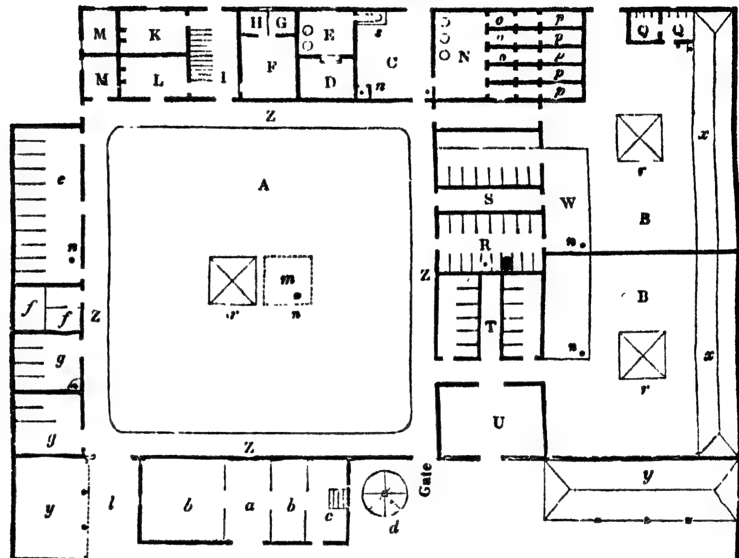
which he laboured twenty-five years, and yet the commentary, except on historical points, rather obscures than illustrates the original. It was prohibited first by the Inquisition of Spain and more strictly afterwards by that of Portugal. This occasioned the following work:—3rd. Defensa por los Comentarios sobre la Lusiada. 4th. Epitome de las Historias Portuguesas, or a History of Portugal. 5th. Imperio de la China, y Cultura Evangélica por los Religiosos de la Compania de Jesus, written by Samedo, but published by Faria. The following are his posthumous works:—El Asia Portuguesa desde 1497 hasta 1640; La Europa Portuguesa hasta 1557; El Africa Portuguesa, translated by John Stevens, 3 vols. 8vo., London, 1796; El America Portuguesa, inedited; Fuente de Aganippe, o Rimas varias; Divinas y humanas Flores; Gran Justicia de Aragon; at the end of which is the 'Retrato de Manuel Faria,' that is to say, his Life, by his friend Porcel. Besides this work the reader may consult Bouterweck, *Spanish and Portuguese Literature;* Nicholas Antonius, *Biblio. Hisp.;* Niceron, *Mémoires*, &c., vol. xxxvi.

FARI'NA. [STARCH.]

FARM. A farm is a portion of land which is set apart for cultivation either by the proprietor or by a tenant who pays a certain stipulated rent for it. We shall consider it in this latter sense; and, without entering into the mode of cultivation, we shall notice the circumstances which determine the profit that a tenant may reasonably expect to make in return for his trouble and outlay.

The first thing to be considered in taking a farm is the capital which the tenant is possessed of, or of which he can procure the use at a reasonable rate. If a man takes a farm without the means of stocking it properly, and is restrained in his first outlay, he will never be able to cultivate it with benefit to himself or to his landlord: he will be obliged to sell his produce at a loss, to over-work his cattle, and to keep a smaller quantity of stock, and consequently make less manure than is required to keep the farm in a productive state. It is not sufficient that he has the means of stocking the farm; he must have wherewith to pay the greater part of the whole expenses and the rent for the first year. In the present state of agriculture, a man who takes a farm of 200 acres of arable land, or land partly arable and partly good pasture, will require from 1600*l.* to 2000*l.*; and it is not the interest, either of the landlord or the tenant, that he should take the farm unless he can command that sum. The amount of capital required depends in a great degree also on the quality of the land; very rich land requires less capital in proportion to the rent than poor land, especially if the poor land requires draining, chalking, or marling, before it will produce any tolerable crops. All these circumstances must be taken into consideration before a farm is hired.

When it is ascertained what extent of farm may be safely undertaken with a given capital, the most important object to be attended to is the condition and fertility of the soil, not only with respect to the natural quality of the land, but the actual state it is left in by the preceding system of cultivation. A moderately fertile soil, in good condition, will give a greater profit for several years than a better soil which is partially exhausted and rendered foul by injudicious management and over-cropping. For this purpose it is necessary to ascertain what has been the state of the crops for several years before, how the land has been ploughed, and whether the crops have been heavy with or without manure. There is no method yet found out of ascertaining the comparative state of land which has been exhausted. It would be a discovery well worth the attention of modern chemists, who have made such progress lately in the analysis of vegetable substances, and would be invaluable to farmers and proprietors of land. In the mean time the nature of the weeds which abound on the land will give some clue to its state; and an experienced person will collect from various minute appearances in the soil whether it has been fairly managed or exhausted. It is in general more advantageous to take a farm in a district with which you are well acquainted. It will be a great advantage if you have had an opportunity of seeing the land at all times, observing it in different seasons and states of the weather, and especially of seeing the crops threshed out, and ascertaining the quantity of corn which is usually yielded from a certain quantity of straw, for lands very similar in outward appearance will produce a very different return when the crops are threshed out. A want of attention to these circumstances is the cause that a man who comes from a distant part of the country and hires a farm on his own judgment seldom succeeds so well as might be expected, even with a superior knowledge of agriculture. He naturally compares the soil with some similar soil which he has been acquainted with. If he comes from a district where the soil is sandy, and where clay is in request, he will give the preference to very stiff loams; if he comes from a cold wet clay, he will prefer the sandy; and the chances are, that he is mistaken in his judgment, and finds it out when he has already embarked his capital in a losing concern. Next to the nature of the soil is to be considered the convenient situation of the farm, the disposition of the fields, and the adaptation of the farm buildings to the most profitable occupation of the land. The roads, especially those which lead to neighbouring towns, whence manure may be obtained, are a most important object; and if there is water carriage, it greatly enhances the value of the farm. The roads to the fields, and the distance of these from the farm-yard; the convenience of having good pasture, or land easily laid down to grass, near the homestead, and especially the situation of the farm-buildings with respect to the land, and the abundance of good water, are all circumstances which must be well considered, and which will greatly influence the probable profits, and consequently the rent which may be fairly offered. A central situation is no doubt the most advantageous for the farm-buildings, as greatly diminishing the labour in harvest and in carrying out manure. But there may be circumstances which render some spot nearer the extremity of the land more eligible, and it is only when entirely new buildings are to be erected that there is a choice. The old farm-buildings are generally in low and sheltered situations, but it is a great inconvenience to have to carry the manure, which is the heaviest thing carted on a farm, up a steep hill. The best situation is on a moderate slope, neither in the lowest nor highest ground.

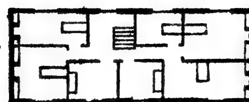


The disposition of the buildings is of great importance both to the landlord and tenant. Large straggling buildings are inconvenient, and cost much in repairs. The house should be neat and comfortable, fit for the residence of a farmer who has a capital such as the farm requires. The rooms should be airy and healthy, facing the south, with a neat garden in front of the house. The farm-yard should be to the north, behind it. Near the house and the farm-yard there should be a small paved court separated from the yard by a low wall. In this court, which should communicate with the dairy, the utensils may be placed on proper benches to air and dry in the sun. The architecture of the buildings may be left to the taste of the proprietor or his architect. The simpler it is, the more appropriate. The yard or yards in a large farm should be sheltered on the north side by the barns, which need not be so extensive as used formerly to be thought necessary. If there is a threshing machine, a single floor to thresh the seeds upon, and to employ the men occasionally in winter, is quite sufficient. Every farm which is so extensive as to require more than one floor to thresh the corn on ought always to have a threshing-mill attached to it. [BARN.]

A small yard, distinct from the other, with sheds for the cattle to shelter themselves under in wet and stormy weather, is a great advantage, and may be added at a trifling expense to any set of farm-buildings. The cart-sheds should be in the stack-yard, which properly occupies a space north of the barn. There should be a sufficient number of stands with proper pillars and frames to build stacks on. Each stack should be of such a size as to be conveniently taken into the barn to be threshed out. The round form, and the square which becomes nearly round when built up, are the most convenient. Nine stone or cast-iron pillars with caps over them are placed on brick foundations, and support a strong frame on which the stack is built. In the centre of the stack there is usually a pyramidical open frame, to allow the air to circulate through the stack, and prevent the heating of the grain. On each side of the yard should be placed the stables, cow-houses, and feeding-stalls, with a pump of good water near the last, and convenient places to put hay, straw, and turnips in, with a machine to cut them. A great deal of time and labour is saved by a proper arrangement of the different parts of the farm-buildings. An underground cistern near the cow-house and stables, into which the urine and washings of the cow-house may run by means of a sink or drain, is a most useful appendage, which is too little thought of in England, whereas it is one of the most indis-

pensable parts of a Flemish farm. It supplies a kind of manure, which can be applied to the land at all times, which invigorates sickly crops, and may often produce an abundant return, where otherwise there would be a complete failure. There are many plans of farm-buildings given in works on agriculture, which combine all that is useful on a large scale. Most of these plans have been executed at a great expense for the farming establishments of noblemen and men of large fortunes. They may be considered as the palaces of husbandry, where much is expended for the sake of grandeur. But the proprietor who desires to erect buildings most proper for the occupation of his land must study economy, and lay out no more in buildings than is necessary. They should be so substantial as not to require frequent repairs; without unnecessarily increasing the original expense of materials and labour. Light thatched roofs are sufficient for the sheds and smaller buildings, and even for the cow-houses and stables; but the waste of straw and the danger from fire should be set against the cost of tiles or slate as a covering. The barn should not be thatched, unless it can be done with reeds, which form a durable and impervious covering, not subject to be infested with rats. The house should always be detached from the farm-buildings, and should have a tiled or slated roof.

We here give a plan of plain farm-buildings for the occupation of 200 or 300 acres of land, of which two-thirds are arable, fit for turnips, barley, clover, and wheat. The farm house should have a large kitchen, two good parlours, and five or six bed-rooms; a wash-house, with coppers to brew; a scullery, and larder. The dairy should communicate with the house, and with a small paved court, near which are the pig-sties and the cow-house. There should be two distinct farm-yards with proper sheds, and in each there should be a cistern for the urine from the stables and the drainings from the dung.

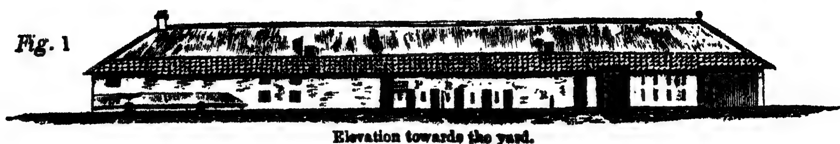


Buildings for a Farm of 300 acres

A, principal yard.
B, second feeding yard, divided.
C, small paved yard adjoining the dairy and piggery.
D, dairy two feet under the level of the yard.
E, wash-house and brew-house.
F, kitchen.
G, skullery.
H, larder.
I, entrance and stairs.
K, best parlour.
L, second ditto; cellars under them.
M M, coal and wood-house.
N, steaming-house for pigs.
Q Q, Hen-houses.
R, calf pens.
S, cow house for sixteen cows, with a passage through it.
T, bullock-house.
U, root and straw-house to cut turnips, chaff, &c.
W, cistern divided into two by a partition, sunk seven feet and vaulted over.
Z, paved road round the yard.
a, barn floor.
b b, bays.
c, raised floor and thrashing-mill.
d, horse race.
e, horse stable.
f f, loose boxes.
g g, spare stables and chaise-house.
h, granary on stone piles.
i i i i, corn-stacks.
l, entrance to the yard
m, tank covered over
n n n, pumps.
o o o, pig-styes.
p p p, small open court to each stye.
r r, feeding cribs.
s, oven.
x x, open sheds for cattle.
y, cart-sheds.

Elevation towards the Garden.

Upper floor.



For a small occupation, where the tenant is but a little above the rank of a day labourer, a set of buildings all under one roof, and forming the longer side of the yard, which may have open sheds round it, such as is represented in the annexed figure and plan, is at once convenient and economical. If this building is thought too long, it can very easily be divided into two, which may be placed at right angles to each other and form two sides of a square. The farm-house and cow-house might form one side, and the stables and barns the other. This is the more common distribution in Flanders.

Flemish Farm Buildings.

SCALE OF FEET.

These two examples of farm-buildings will be sufficient to give some idea of what may be proper for farms of an intermediate size. A principal thing to be attended to is to have plenty of room for cattle: and where old barns remain much larger than is required according to the present mode of stacking corn in the yard, they can be very advantageously converted into cow-stalls or ox-stables. Where many sheep are kept, it is of great advantage to have a sheep-yard, with low sheds all round, at the time when the ewes lamb, especially when the season is wet and chilly, which hurts them more than a dry frost. The second yard B (see plan, p. 197) is well adapted for that purpose; and an additional temporary shed against the partition which divides it in two will convert either division into an excellent sheep-yard.

In valuing the rent of a farm the habitation of the farmer is seldom taken into the account, and it ought not to be above the station of the tenant; but the buildings immediately connected with the cultivation necessarily add to the rent or diminish it, as they add to or diminish the profit.

The next important question is what may be a fair rent both to the landlord and the tenant. This depends as much on the mode of cultivation adopted as on the fertility of the soil. The tenant must have a fair interest for his capital, and a fair remuneration for his trouble. In the old system a third of the gross average produce was considered as a fair rent, including all the direct payments for the occupation of the land, such as tithes, rates, and taxes; another third was supposed to cover the labour and expenses of the farm and interest of capital; and the remaining third was appropriated to the maintenance of the farmer and his family, out of which he had to save whatever he laid by as a clear profit. But this calculation is no longer applicable to the present state of agriculture. The expenses are greatly increased, and the produce is also greater. It requires a greater capital, and more skill to manage a large farm. The tenant is a man of a more liberal education, and his habits are more expensive. The occupier of 500 acres of land in England expects to live as well as a land-owner of 500*l.* a year income. He cultivates better by applying more labour, and much of the produce is owing to his skill and his capital. He therefore expects a greater share of the produce than the landlord, not only to repay his outlay, which is greater, but to live upon. Supposing the tenant to have a capital employed equal to ten times the rent, which is often the case, the gross annual produce ought to be equal to five times the rent. This we shall distribute as follows: two-fifths for expenses, including rates, tithes, labour, and interest of capital at 5 per cent.; one-fifth for rent; one-tenth for improvements and purchased manure; and three-tenths for the net profit of the farmer, out of which he is to live. This appears a less proportion than the old third; but it must be remembered that the produce is greatly increased. It will be found, wherever accurate accounts are kept and a farm is skilfully managed, that the proportions above stated are not far from the truth. It requires much judgment and experience to calculate what average crops may be expected by an improved mode of cultivation, and especially by increasing the number of cattle and sheep maintained on the farm.

In Scotland it is notorious that rents are much higher than in England, not only for small occupations, but for extensive farms; and that the tenants have complained less of the times than their neighbours in the south. It may be worth while to inquire into the cause of this, for the low price of corn must affect the Scotch farmer equally with the English. One great difference between the Scotch and the English farmer is, that the former gets work done at a cheaper rate than the latter. The Scotch labourer is fully as well fed, and clothed, and lodged, as the English; but he has less money to spend at the alehouse. He is paid, not in a certain sum every Saturday, but in comforts, in the keep of a cow, in a certain number of rows of potatoes, a certain quantity of malt to make his beer, a cottage to live in, and a meal to feed his family. His immediate wants are supplied, and he is comfortable; the consequence is, that he works willingly. He has no remnant of the last night's debauch at the beer-shop. He is early at work, and he does his work cheerfully. The horses of a Scotch farmer are well fed; they are always in good condition. They work ten and even twelve hours in a day at two yokings. The ploughman only thinks how he shall finish his work in proper time, and unless he makes the horses work as much as they can without distressing them, he knows he shall not get through his work. All this is worth 25 per cent. on the whole labour of the farm, as Arthur Young has very judiciously calculated, when he gives the expense of labour on the farm of a gentleman, compared with that on the land of a farmer who works with his men. (See *Farmer's Guide.*) The moral effect of an interest in the work to be done, when opposed to that of a perfectly distinct and often hostile interest, will readily account for so great a difference.

But besides this the Scotch farmer has generally the advantage of a scientific education, and of a thorough knowledge of the principles of his profession; and with the shrewdness peculiar to his country, he knows how to take advantage of every favourable circumstance. He has also been taught to calculate, and will soon discover where there is a profit or a loss. This has made him turn his attention to cattle and sheep of late years, more than to the production of corn; and the Scotch have found, that while a very

decent profit was made on the cattle, their land produced more corn, although it sold at a lower price; for the green crops raised for the cattle, and the manure made by them, enriched the land so much, that the average produce on some light lands was nearly doubled. All this kept up rents to a much higher level than in England, where prices were low, and there were no means of diminishing expenses or increasing produce. Hence rents in Scotland have kept up wonderfully, when we consider the great fall of rents in England since the peace.

The price of agricultural produce throughout Great Britain and even Ireland is brought very nearly to an equality, the only difference being occasioned by the means of transport. But the price of labour still varies much, and this is owing to local circumstances, which it is hoped will gradually cease. While the very unequal distribution of the expense of the maintenance of the poor was not remedied, adjoining parishes might differ in any proportion with respect to the actual price of labour; and before a fair rent could be calculated, it was necessary to consider how much of the value of the labour was paid directly, and how much in the shape of rates. Our northern neighbours were free from this uncertainty.

Farm Accounts.—In proportion as the management of a farm requires more skill, and the various operations become more complicated, so the necessity of great accuracy in the accounts becomes more evident. The manner in which farm accounts should be kept deserves therefore particular attention.

Many farmers, who are not devoid of intelligence, and who are anxious to ascertain their gain or their loss in cultivating the land which they have hired, have no other means of ascertaining this than the balance of their account of receipts and expenditure. If they have separated the accounts of their private establishment from that of their farm, they think that they have done all that is required, and at the end of the year they can tell accurately how much they have gained or lost by their farm. But ask them to account for this gain or loss, and they can give no answer. If a tradesman, who has a capital in business equal to that of a farmer of a considerable number of acres, were to keep accounts in this manner, and become a bankrupt, no one would hesitate in saying that he failed because he kept no regular accounts. He had no greater stake than the farmer, and his transactions were perhaps less varied: if he kept no clerk, he should have attended better to the accounts himself. The same may be said of the farmer; and if a man who has a floating capital of 2000*l.* does not think it worth his while to employ a clerk to keep his accounts, not having time to do so himself, it is no great wonder if he is involved in difficulties. But it may be said that agricultural accounts are very simple, and that any one can keep them. So are merchants' accounts at first sight. Nothing is simpler than to put down what is bought and sold, what is the profit on each transaction, and the sum is the profit on the whole. But merchants know that to keep this very simple account many books, many entries, many checks, and consequently many clerks are required. In a lesser degree this is true in a farm. It is easy to know what is bought and sold; what is expended or produced; but it requires very minute accounts to ascertain what part of the farm gives a profitable return, and what is the cause of loss. There may be a profit on the crops and a loss on the stock, or *vice versâ.* The money expended on improvements or adventitious manure may have produced an increase which is proportionate to the outlay, and which affords a good interest; but it may also be a decided loss. How is this to be ascertained, except it be by accurate accounts? The expense of keeping accounts is much overrated. A clerk who has his board and 30*l.* a year is generally a young man who has some education. He is useful in seeing that the operations ordered by the farmer are duly executed. He is a trusty overseer, and, as he has his accounts in his thoughts, he is most likely to detect the cause of any loss, from a want of attention in subordinate agents;—his salary is therefore well earned, and the farmer will not think it thrown away. In whatever manner the accounts are kept, whether by the farmer himself or by a clerk, method is of great importance: and whatever may be said against it by those who do not know its value, there is no system of accounts which can be compared with the well-known method of double entry, as it is called, which is of Italian invention. The principle of this method is so simple, that the slowest arithmetician cannot be confused by it, and it is so perfect that no error can escape its scrutiny. As applied to agricultural accounts, which are simple in their nature, it becomes so clear, that if once adopted, it is impossible that it should ever be abandoned. The satisfaction of a perfect proof of the correctness of the accounts is so great, that no one who has ever experienced it will be satisfied with any other method.

To give a general and comprehensive notion of the system of double entry, to those who are unacquainted with it, would lead us from our present purpose, suffice it to say, that every account is checked by another, in which the same entry is made in a different manner. The sum of all the entries must be equal on each account; and consequently any inequality indicates an error somewhere, which may be detected.

In the accounts of a farm there are many separate items to be taken into consideration. There may be a separate account kept for every field. There should always be one for every crop of which the rotation consists. There is an account of the labour of men and horses; of the produce of the dairy; of the stock purchased to be fatted, or sold again in an improved state. In short the divisions of the general account may be increased without limit. The more subjects there are to furnish items for an account, the more difficult it is to strike a balance, but, with a little attention and perseverance, it may be done; and he who keeps very correct accounts will always be the first to discover any impending evil, and to take measures to provide against it.

The basis of all the accounts is a daily journal of every transaction, which must be collected from all the labourers and agents employed. M. De Dombasle, at his celebrated farm of Roville, in France, has all his principal servants and his apprentices assembled every evening after the day's work is over. Each man gives an account of the work done by him or under his superintendence, which is written down by the clerk. The orders for the next day are then given, and every one returns to his lodging or his home. In the course of the next day the clerk enters all that is in the journal into a book, where every person employed has an account; every field has one; every servant and domestic animal has one; and every item which can be separated from the rest is entered, both as adding to the account or taking from it. For example, the milk of the cows is entered daily. The quantity of butter, butter-milk and skimmed-milk, which it produces is also entered; and these two accounts check one another. Any error is immediately detected, and the knowledge of this prevents mistakes. An entry should be made of every particular operation in each field, that the farmer may know which is his most profitable land. The number of ploughings, the quantity of manure, the state of the weather, and all other circumstances which may influence the return should be carefully noted, in order that it may be clearly seen whether any experiment or deviation from the usual routine is advantageous or otherwise. Thus all real improvements may be encouraged, and uncertain theories detected by the result.

The most important circumstance which influences the profits of a farmer is the cost of his team and the wages of his labourers. These vary in different situations so much, that they greatly influence the rent which he can afford to give for the land. In some parts of the country the horses are pampered and kept so fat that they can scarcely do a day's work as they ought. In others they are over-worked and badly fed. Either extreme must be a loss to the farmer. In the first case, the horses cannot do their work, and they consume an unnecessary quantity of provender; in the other, they are soon worn out, and the loss in horses that become useless or die is greater than the saving in their food, or the extra work done by them. A horse properly fed will work eight or ten hours every day in the week, resting only on Sundays; by a judicious division of the labour of the horses, they are never over-worked, and an average value of a day's work is easily ascertained. This, in a well regulated farm, will be found much less than the common valuations give it. It is here that most of the errors are to be detected in the accounts of the expense of cultivation given in evidence before parliament, without any intention to deceive in those who gave the accounts. There have been printed forms invented in order to render the accounts more simple as well as more comprehensive. Forms may be of use to enter minute details; and each superintendent labourer may have a form of entry for the work which he performs or superintends; but the ledger

should be kept exactly as that of a mercantile man, and be frequently balanced to ensure correctness. This is a thing which cannot be too strongly recommended to young farmers.

When a farm has been agreed for as far as rent is concerned, there are always conditions in a lease, which it is of great importance to the farmer to understand fully. It is necessary that the landlord should have some security against the wilful deterioration of his land by a dishonest tenant, but agents are too apt to cramp the tenants by prescribing the exact mode of cultivation without giving the tenant sufficient scope to try improved methods, which may ultimately be highly beneficial to all parties. If the landlord can ensure that the proper quantity of manure is put on the land every year, and that it shall be well tilled and kept free from weeds, he need not have any other protection, unless it be for the last two or three years of the lease, when the tenant might be induced to over-crop the land, and thus exhaust it.

In entering on a farm there is often a heavy demand on the in-coming tenant for work done by the predecessor, for a supposed remainder of manure, and various other items, which are usually settled by reference to the custom of the country. Some general rule is required to regulate all these demands, which are often exorbitant, and cripple the in-coming tenant in his capital. It is just that an outgoing tenant should be repaid for any permanent improvement which he has made, and of which he has not reaped the whole advantage, and that he should be encouraged to keep up the proper cultivation of the land, so that the incoming tenant may be able to continue the regular course. But this he will not do, unless he expect to be remunerated. On the other hand, it is also just that the in-coming tenant should not pay for work slovenly done or for supposed remnants of manure which do not exist in the land. We have known instances where the valuation of all the items to be paid for by the in-coming tenant greatly diminished his capital and crippled his operations for several years. There should therefore be a separate stipulation on this head before a farm is finally hired.

FARMER, Dr. RICHARD, descended from a respectable family in Leicestershire, was born at Leicester, August 28, 1735. He received the early part of his education in the Free Grammar School of his native town, and in 1753 was entered a pensioner of Emmanuel College, Cambridge. He appears to have been little influenced by the overbearing tendency to mathematical study which existed and still exists in that University, and, after his degree, took no interest in pursuits of that nature, farther than was necessary for the purposes of college tuition. In 1760 he became Classical Tutor of Emmanuel College, which office he held until his election to the mastership in 1775. He served the office of Vice-Chancellor in the same year, and in 1778 was elected Chief Librarian to the University. In 1780 he was collated to a prebendal stall at Lichfield, and some time afterwards became Prebendary of Canterbury, which he resigned (1788) for the office of a Canon Residentiary at St. Paul's. He died after a long and painful illness, at Emmanuel Lodge, Sept. 8, 1797, and was buried in the chapel. An epitaph to his memory was written by Dr. Parr, and is inscribed on the college cloisters. Dr. Farmer collected a valuable library of tracts and early English literature, which was sold after his death and produced, as it is said, a great deal more than it originally cost.

Dr. Farmer's constant residence at Cambridge is said to have been owing to an early disappointment in love; a cause perhaps more productive of resident fellows than any other. His political principles were inclined to toryism, and he appears to have been attached to that party in the church which goes by the name of 'orthodox.' His manners were frank and unreserved, and his habits rather those of a boon companion than of a clergyman. It is reported of him that he declined a bishopric rather than forego his favourite amusement of seeing Shakspeare performed on the stage, a reason which, if founded on truth, had at all events more cogency in the time of Garrick than at present.

Dr. Farmer is celebrated, and justly so, for one single work, his 'Essay on the Learning of Shakspeare,' which, in our opinion, surpasses anything of the kind written in England, and is perhaps the best commentary which we possess. The mixture of gold and rubbish which is generally appended as notes to every edition of Shakspeare contains so little of the former element and so much of the latter, that it is not easy to estimate such commentaries as Dr. Farmer's above their true value; indeed, if we had to choose from all Shakspeare's voluminous annotators what appears to us most deserving of study, we should have no hesitation, as far as English literature goes, in fixing on Coleridge's 'Lectures' and Dr. Farmer's 'Essay,' works which are, and are intended to be, entirely dissimilar, but which, more than any others, come up to our notion of a commentary on Shakspeare.

FARMERS GENERAL, Fermiers Généraux, was the name given in France under the old monarchy to a company which farmed certain branches of the public revenue, that is to say, contracted with the government to pay into the treasury a fixed yearly sum, taking upon itself the collection of certain taxes as an equivalent. The system of farming the taxes was an old custom of the French monarchy. Under Francis I., the revenue arising from the sale of salt was farmed by private individuals in each town. This was and is still in France and other countries of Europe a monopoly of the government. The government has alone the right of providing the people with salt, which it collects in its stores, and sells to the retailers at its own price. This monopoly was first assumed by Philippe de Valois in 1350. Other sources of revenue were likewise farmed by several individuals, most of whom were favourites of the court or of the minister of the day. Sully, the able minister of Henry IV., seeing the dilapidation of the public revenue occasioned by this system, by which, out of 150 millions paid by the people, only 30 millions reached the treasury, opened the contracts for farming the taxes to public auction, giving them to the highest bidder, according to the antient Roman practice. By this means he greatly increased the revenue of the state. But the practice of private contracts through favour or bribing was renewed under the following reigns: Colbert, the minister of Louis XIV., called the farmers of the revenue to a severe account, and by an act of power deprived them of their enormous gains. In 1728, under the regency, the various individual leases were united into a Ferme Générale, which was let to a company, the members of which were henceforth called Fermiers Généraux. In 1759, Silhouette, minister of Louis XV., quashed the contracts of the farmers general, and levied the taxes by his own agents. But the system of contracts revived: for the court, the ministers, and favourites were all well disposed to them, as private bargains were made with the farmers general, by which they paid large sums as douceurs. In the time of Necker, the company consisted of 44 members, who paid a rent of 186 millions of livres, and Necker calculated their profit at about two millions yearly, no very extraordinary sum, if correct. But independent of this profit there were the expenses of collection, and a host of subalterns to support: the company had its officers and accountants, receivers, collectors, &c., who having the public force at their disposal, committed numerous acts of injustice towards the people, especially the poorer class, by distraining their goods, selling their chattels, &c. The 'gabelle' or sale of salt, among others, was a fruitful source of oppression. Not satisfied with obliging the people to pay for the salt at the price fixed upon it in the name of the king, they actually obliged every individual above eight years of age to buy a certain quantity of salt whether wanted or not. But the rule was not alike all over France; in some provinces, which enjoyed certain privileges, salt was nine livres the 100 weight, whilst in others it cost 16, and in some 62 livres. In some provinces the quantity required to be purchased per head was 25 pounds weight; in others it was nine pounds. And yet the provinces, nay the individual families of each province, were prohibited under the severest penalties from accommodating each other's wants, and buying the superfluous salt of their neighbours, but whoever wanted more salt than his obligatory allowance was obliged to resort to the government stores. Besides, every article of provisions that was exported from one province to another was subject to duties called Traites. Every apprentice on being bound to a master was bound to pay to the king a certain sum according to the nature of the trade, and afterwards a much larger sum on his admission to practise his trade as a master. These few instances may serve to convey an idea of the spirit of taxation in France previous to the revolution. A lively but faithful picture of the whole system is given in Breton's *Histoire Financière de la France*, 2 vols. 8vo., Paris, 1829. The farmers general, as the agents of that system, coming into

immediate contact with the people, drew upon themselves a proportionate share of popular hatred. But the revolution swept away the farmers general, and put an end to the system of farming the revenues: it equalized the duties and taxes all over France; but the monopoly of the salt and tobacco has remained, as well as the duties on provisions, cattle, and wine brought into Paris and other large towns, and the right of searching by the octroi officers, if they think fit, all carriages and individuals entering the barriers or gates of the same.

The system of farming the taxes, although generally disapproved of, is still continued in some European states. Not many years ago the custom-house duties at Naples were farmed by private speculators. For the character and effects of the system see Necker, *De l'Administration des Finances*.

FARNABY, or FARNABIE, THOMAS, a learned critic and grammarian, was born in London in 1575. His grandfather was of Truro in Cornwall; but his great-grandfather, an Italian musician, was the first of his family who settled in England. He was admitted of Merton College, Oxford, in 1590, in the station of a servitor; but being of an unsettled disposition, he quitted the university abruptly, changed his religion, passed over to Spain, and was received into one of the colleges of that country belonging to the Jesuits. Growing weary of the discipline of the Jesuits' institution, he did not stop very long with them, but in 1595 joined Sir Francis Drake and Sir John Hawkins in their last expedition. He is reported also to have served subsequently as a soldier in the Low Countries. Gaining no profit in these expeditions, he returned to England, landed in Cornwall, and in the urgency of his necessities descended to the humble employment of teaching children their horn-book. In this situation he assumed the name of Thomas Bainrafe, the anagram of Farnabie. After some time he changed his residence to Martock in Somersetshire, where he established a grammar-school for youth with great success, under his own name. From Martock he removed to London, and opened a school in Goldsmiths' Rents behind Red-cross-street, near Cripplegate, where his reputation became so established, that the number of his scholars, chiefly the sons of noblemen and gentlemen, amounted at one time to more than 300. Antony à Wood says, his school was so frequented that more churchmen and statesmen issued from it than from any school taught by one man in England. Whilst here he was created M.A. in the University of Cambridge, and on the 24th April, 1616, was incorporated in the same degree at Oxford. In 1636 he quitted London to reside at Sevenoaks in Kent, but here he resumed his former occupation, and, with the wealth which he had accumulated, purchased landed property both in Kent and Sussex. In 1641 he became mixed up in the commotions of the times as a favourer of the royal cause, and was fortunate in receiving no other punishment than residences in prison, first in Newgate, and afterwards in Ely House. It was at one time debated in the House of Commons whether he should not be transported to America. Wood insinuates that some of the members of both Houses who had been his scholars were among those who urged his being treated with severity. He died on the 12th of June, 1647, and was interred in the chancel of the church at Sevenoaks.

His own works were—1. 'Index Rhetoricus Scholis accommodatus,' 12mo. Lond. 1625: to which in 1646 were added 'Formulæ Oratoriæ et Index Poeticus:' the fifth edition was printed in 1654. 2. 'Florilegium Epigrammatum Græcorum, eorumque Latino versu à variis redditorum,' 8vo. Lond. 1629, 1650. 3. 'Systema Grammaticum,' 8vo. Lond. 1641. 4. 'Phraseologia Anglo-Latina,' 8vo. Lond. 5. 'Tabulæ Linguæ Græcæ,' 4to. Lond. 6. 'Syntaxis,' 8vo. Lond. His editions of the classics, with annotations, were Juvenal and Persius, 12mo. Lond. 1612; Amst. 1662; Hag. 1663. Seneca, 12mo. Lond. 1613; Amst. 1632, 1634; 8vo. Pat. 1659; 12mo. Amst. 1665. Martial, 12mo. Lond. 1615; Gen. 1623; Lond. 1633. Lucan, 12mo. Lond. 1618; 8vo. Francof. 1624. Virgil, 8vo. Lond. 1634. Ovid, fol. Par. 1637; 12mo. Lond. 1677, &c. His Notes upon Terence were finished only as far as the fourth comedy when he died; but Dr. Meric Casaubon completed the two last comedies, and published the whole at London, 12mo. 1651. Other editions were 8vo. 1669; and Salm, 1671. Dr. Bliss, in his additions to Wood's Athenæ, says, 'Farnaby intended an edition of Petronius Arbiter's Satyricon.' (*Biogr. Brit.* Kippis's edit. vol. v. p. 682; Wood's *Ath. Oxon.* last edit. vol. iii. col. 213-216; *Biogr. Universelle*, tom. xiv. p. 168.)

FARNE'SE, the name of a noble family of modern Rome, who were originally feudatories of the territory of Farnese and Montalto, in the Papal States, south-west of the lake of Bolsena, and near the borders of Tuscany. The splendour of this family was greatly increased by the exaltation of Cardinal Alessandro Farnese to the Papal See after the demise of Clement VII. in October, 1534. [PAUL III.] This pope had a natural son, Pier Luigi Farnese, whom he determined to make a sovereign prince. For this purpose he first of all alienated part of the territory of the church in the neighbourhood of the feudal domain of his family, and formed a duchy called that of Castro, from the name of its chief town, adding to it the towns of Ronciglione and Nepi, with their territories. This district, which comprised nearly one-half of the province called Patrimonio di S. Pietro, he bestowed on Pier Luigi and his descendants, with the title of Duke of Castro, as a great fief of the Holy See. He also obtained for him from Charles V. the investiture of the Marquisate of Novara as an imperial fief, and from the Venetian Senate permission to be inscribed on the golden book of the patricians of Venice, an honour considered as equal, if not superior, to that of a feudal title. The pope also made his son Gonfaloniere, or Captain General, of the Holy See, an office which Pier Luigi dishonoured by the most depraved conduct. Lastly, Paul III. in 1545 gave his son the investiture of Parma and Piacenza, which Pope Julius II. had conquered, with the title of sovereign duke of those states, on condition that the duke and his successors should pay an annual sum of 8,000 ducats to the Roman See. The emperor Charles V., however, who, as Duke of Milan, had claims on Parma and Piacenza, would not bestow the investiture upon Pier Luigi. The new Duke of Parma and Piacenza soon became hateful to his subjects for his vices and oppression, and a conspiracy was formed by Count Anguissola and other noblemen, secretly countenanced by Don Ferrante Gonzaga, imperial governor of Milan, who hated Pier Luigi. On the morning of the 10th September, 1547, Anguissola stabbed the duke while at dinner in the ducal palace of Piacenza, and threw his body out of the window, when it was mutilated and dragged about by the mob. Piacenza was taken possession of by the imperial troops, but Parma remained in possession of Ottavio Farnese, son of the murdered duke. In 1556, Philip II., as sovereign of the Milanese, restored Piacenza to the Duke Ottavio, but the citadel continued to be garrisoned by Spanish soldiers. Ottavio dying in 1587, was succeeded as Duke of Parma and Piacenza by his son Alessandro Farnese, who distinguished himself as general of the Spanish armies in the wars against France. He was made governor of the Spanish Netherlands by Philip II., and carried on the war against the Prince of Orange. He is known in history by the name of the Duke of Parma. Alessandro died in 1592, and was succeeded by Ranuccio Farnese, a suspicious and cruel prince. A conspiracy was hatched against him at Rome, but it being discovered, a number of people were put to death in 1612. His successor, Odoardo Farnese, quarrelled with Pope Urban VIII. about the Duchy of Castro, which that pope wished to take away from him to give it to his own nephews, the Barberini. This gave rise to an absurd and tedious warfare between the papal troops and those of Parma. Ultimately, through the mediation of other princes, the Farnese were left in possession of Castro, but under the following pontificate of Innocent X. they were finally deprived of that territory in 1650, and the pope razed the town of Castro to the ground, under the pretence of its bishop having been murdered by some assassins. This occurred under Ranuccio II., Farnese, Duke of Parma, who had succeeded Odoardo. The Farnese continued to rule over Parma and Piacenza till 1731, when the last duke, Antonio Farnese, having died without issue, the male line of the Farnese became extinct. But Elizabeth Farnese, wife of Philip V. of Spain, claiming the duchy for her children, it was ultimately given, by the peace of Aix la Chapelle, to her younger son Don Filippo. [PARMA.] The other fiefs, however, and the personal property of the Farnese, including the rich museum and the splendid palaces at Rome, were given to his brother, Don Carlos, king of the two Sicilies, and some of the finest statues and paintings in the museum of Naples are derived from that inheritance. The Farnese palace at Rome, which belongs to

the king of Naples, is considered the finest among the numerous palaces of that city. The Farnesina or smaller mansion on the opposite or right bank of the Tiber is known for the beautiful frescoes of Raphael. The Orti Farnesiani occupy a great part of the Palatine, and include some remains of the palace of the Cæsars.

Among the various families which have owed their aggrandizement entirely to a papal ancestor, the Farnese attained the highest rank among Italian princes, and retained it the longest. It has also produced several cardinals, distinguished for their learning. (See Ciacconius, *Vitæ et Gesta summorum Pontificum et Cardinalium;* Moreri's *Dictionary*, art. 'Farnese;' and Affo's *Vita di Pier Luigi Farnese*, and the Italian historians of the 16th century.)

FARNHAM, a town in the parish and hundred of Farnham and county of Surrey, 9½ miles west by south from Guildford, and 38 miles south-west by west from London. The town, which is situated near the north bank of the Wey, consists of one principal street running east and west, and contains many excellent houses. Though not a corporation, it is governed by twelve masters or burgesses, from whom two bailiffs are annually chosen. These magistrates act under the bishop of Winchester, to whom they pay an acknowledgment of 12*d*. per annum, receive the profits of the fairs and markets, and hold every three weeks a court, which has power to determine all actions under forty shillings. Farnham once returned members to parliament. The church, which is dedicated to St. Andrew, was formerly a chapel of ease to Waverley Abbey, and appears to have been erected about the beginning of the sixteenth century. The tower is substantially built, and has a small turret at each corner. In the interior there are some handsome monuments, and a fine painting of the twelve apostles forms the altar-piece. The vicarage is in the diocese of Winchester; patron the archdeacon of Surrey, and average net income 430*l*. The other public buildings are a market-house, a free-school, and a good day-school supported by charitable contributions. The manor of Farnham was given by Ethelbald, king of the West Saxons, to the see of Winchester, to which it has ever since belonged. On the north side of the principal street, and on the summit of a hill, formerly stood a castle, built by Henry de Blois, brother of King Stephen, and bishop of Winchester. This fortress was destroyed by Henry III. It was re-built, and again destroyed during the civil war. After the Restoration Dr. Morley, bishop of Winchester, expended a considerable sum in erecting the present structure, which is of brick, covered with stucco, embattled, and of a quadrangular form. It contains a fine library, and some good paintings. Adjoining the castle is an extensive park, through which the little river Loddon flows. About two miles south-east of the town is Moor Park, once the seat of Sir William Temple. On the borders of the park is Waverley Abbey, a neat modern mansion, which derives its name from a monastery of Cistertian monks, the ruins of which are in the vicinity. Farnham is noted for its hop plantations. It had formerly some cloth manufactures. The great mart for the Farnham hops is Weyhill fair. The largest plantations are less than 60 acres. The average produce is about 6¼ cwt. per acre. According to the census of 1831, the population of the parish of Farnham was 5858. The market-day is Thursday. The fairs for horses, cattle, sheep, and hogs are held on Holy-Thursday, 4th June, and 13th November.

(Carlisle's *Topog. Dict.;* Stevenson's *Survey of Surrey;* M'Culloch's *Commercial Dict.; Beauties of England and Wales; Municipal Corporation Reports; Ecclesiastical Revenues Reports; Population Returns.*)

FARO in Italian and Spanish, *pharus* in Latin, *phare* in French, was the name given to light-houses in the Mediterranean. The first light-house, called Pharus, is said to have been that raised by Sostratus of Cnidus B.C. 283, on the island at the entrance of the new harbour of Alexandria, the island itself being called Pharos. [ALEXANDRIA, ANCIENT.] The name became afterwards an appellative for light-houses, and in some instances it has been given to the towns near which a light-house was built. Such, for instance, is the town of Faro, in Algarve. Torre di Faro, a light-house on Cape Pelorus, in Sicily, has given its name to the straits at the entrance of which it is placed, between Calabria and Sicily, and which the Italians call Faro di Messina. The united kingdom of the Two Sicilies is divided, with regard to its administration, into 'domini di quà del Faro,' meaning the continental part, and 'domini di là del Faro,' that is to say, the island of Sicily.

FAROE, FEROE, or FAROERNE ISLANDS, a group twenty-two in number, seventeen of which are inhabited; they are about 390 miles west of the coast of Norway, and about 200 north-west of the Shetland Isles, between 61° and 63° N. lat., and 8° and 6° W. long. They were discovered between the years 858 and 868 by some Norwegians, in the time of Harold Harfager, king of Norway, and at present belong to Denmark. Their whole area is estimated at about 494 square miles, and the population at about 5800.

These islands mostly consist of steep rocks, some of them rising gradually from the sea, by two or more sloping terraces, covered with a thin stratum of earth, which produces grass. Close to the sea the land consists in general of perpendicular rocks, from twelve to eighteen hundred feet in height. The most westerly island is Myggenaes, the most southerly is Suderoe, the most easterly are Svinoe and Fugloe, and the most northerly are Kalsoe and Videroe. The interior is composed of hills, usually separated only by narrow ravines, in which there are brooks or rivulets which are in general so swollen in the rainy season as to become impassable: there are no valleys of any extent. Some authors report that the greatest elevation in these islands is the basalt mountain Skaellingfield, in the south part of the largest of them, Stromoe, which is nearly the central island of the group, and divided by narrow straits from Vaagoe and Osteroe; this mountain is about 2240 feet high. Another writer mentions the Skattaretinel as being the highest, and states its elevation at 2816 feet. There are several lakes, among which the largest are the Soorvagsvatn in Vaagoe, which is three miles long, and the Sandsvatn in Sandoe: and there are some falls of water, the most considerable of which is the Fossa in Stromoe, which has a double fall, nearly 200 feet in height. Among the mineral springs the most esteemed is that of Varmakielde in Osteroe. The climate is very bleak, and the summer lasts only through the months of July and August: yet it seldom freezes more than one month in the year, nor are the harbours ice-locked except in very severe winters. Violent storms prevail at all seasons, which prevent the growth of any large trees, and compel the inhabitants to fix their dwellings between the hills. The soil is stony, and in many parts covered with earth only four inches deep. In some islands there are majestic groups of basalt formation, similar to the caves of Staffa. Neither the soil nor climate admit of any extended tillage; and the sudden variations in the temperature induce the cultivator frequently to gather in his crops in a half-ripe state, and dry them by artificial heat. They consist principally of barley and rye, the growth of which is scarcely adequate to the consumption; potatoes, parsnips, turnips, and carrots are partially raised, but it is extremely difficult to raise any other vegetable. Landt states the proportion of the cultivated to the uncultivated land to be about 1 to 60, and that the corn-fields are not more than from 8 to 12 feet in breadth. The pasture-lands are luxuriant, and the chief wealth of the islanders consists in their flocks, often containing from 300 to 500 sheep, which graze in the open air the whole year round, and yield wool of good quality. Horses of small stature, but strong, swift, and sure-footed, are bred in considerable numbers: the horned cattle are also diminutive, yet become exceedingly fat. Few swine are fed. The dog is in so much request, that his value is equivalent to that of a cow. Seal-catching, and the whale, cod, herring, and other fisheries are another main resource of the people. Independently of domestic animals, the islands contain only rats and mice. There is an immense number of wild-fowl, such as eider-ducks, swans, geese, pigeons, solan-geese, puffins, cormorants, plovers, &c.

Turf is used for fuel. Beds of coal were discovered in the island of Suderoe in 1709, and some mines have been opened from time to time; but the coals are of inferior quality, and the cost of working and transporting them has caused them to be abandoned. Copper is found in the island of Nolsoe. Jasper and opal are met with here and there.

The inhabitants are of Norman (or Norwegian) descent, and speak the Norwegian language with a Danish accent. They have in general handsome features, and are well made: those of the northern are taller, and have more elongated countenances than those of the southern islands. They are ingenious, peaceable, honest, hospitable, and simple in their manners. Their number in 1769 was 4775;

in 1782, 4409; and in 1801, 5265. Their food consists of milk, fish, mutton, poultry, wild-fowl, and barley groats; bread and salt are considered luxuries. Their clothing is of coarse woollen, woven by their own hands. They are either hereditary proprietors of the soil which they cultivate, or farm lands under grant from the crown, from which circumstances they have the respective appellations of Odelsbonde or Kongsbonde. Christianity was introduced among them about the year 1000; they now profess the Lutheran faith, and are divided into thirty-nine flocks, under the care of seven incumbents, who minister among them week by week in rotation, the service in their absence being performed by one of the elder parishioners. The amtmann, or bailiff, is at the head of civil affairs: in judicial matters the landvoigt, or judge, is assisted by sidesmen from each parish.

Ship-building and commerce have greatly improved since a free trade with Denmark was granted at the beginning of the present century. There are some mechanics and good shipwrights; woollen-yarns, cloths, and stockings are manufactured; and there are a few tanneries. The exports consist of hose and trowserings, fish, feathers, skins and hides, butter, tallow, train-oil, &c.: the imports, of grain, bread, malt, brandy, salt, hemp, iron, timber and deals, linen, &c. The whole revenues of the islands are said to be about 4000 dollars, or 900*l.*

The larger islands are Stromoe, 27 miles long and about 7 in breadth: its capital Thorshavn, on the south-east side of the island, is the seat of government, and has a neat wooden church, a Latin school, and a fort. The streets are exceedingly narrow. There are about 100 houses with as many families. Population about 1600. Osteroe, to the east of Stromoe, is in length about 20 miles, and in its greatest breadth about 10. It has two fresh-water lakes and several deep fiords, or inlets of the sea, on the eastern side. There is a curious basaltic hill about 420 feet high, consisting of pentagonal and octagonal columns, on a foundation of trap 300 feet in height; and at the N.N.W. point of the island there are two rocks, with the appearance of colossal statues, which are called Risin and Kiedlingen, and are 240 feet high. On the south-west side is a safe harbour, the Kongshavn. The population of Osteroe is about 1300. Sandoe, to the south of Stromoe, is about 13 miles long and 1½ broad: it has a large lake called Sandsvath, which abounds in trout, five villages, three churches, and is the residence of the Amtspropst, who is the head ecclesiastical authority. Suderoe, lying south of the preceding, is about 17 miles in length and 5¼ in its greatest breadth, and contains 10 villages and 6 churches. It is full of rocks and precipices. Population about 700. Punthavn, its port, is almost the only spot where there is a safe landing. Vaagoe, to the west of Stromoe, is nearly 13 miles long and about 5 broad. Its principal lake, Soorvaag, is the largest in the Faroe islands, and is full of trout. It has four churches, the parochial one being at Midvaag, a village and seaport. Myggenaes, to the west of Vagoe, is an inconsiderable island about three miles broad. The remainder of the 17 inhabited islands are Fugloe, Svinoe, Videroe, Bordoe, Konoe, Kalsoe, Kolter, Hestoe, Nolsoe, Skuoe, and the greater Dimon. (Landt's *Faroerne;* Thaarup's *Danske Stat;* Hassel's *Denmark.*)

FARQUHAR, GEORGE, was born at Londonderry in 1678, and received his education at the university of Dublin. Though he displayed talents at an early age he did not take any degree, but forsook his severer studies for the stage, and appeared at the Dublin theatre. He never however made any great figure as an actor, and having had the misfortune to wound a brother comedian with a real sword, which he mistook for a foil, he forsook the stage, being at that time only seventeen years of age. He accompanied the actor Wilks to London, and attracted the notice of the Earl of Orrery, who gave him a commission in his own regiment, which was then in Ireland.

Wilks exhorted him to try his powers as a dramatist. Accordingly in 1698 he produced his comedy of 'Love and a Bottle,' which was so successful as to encourage him to another effort. His 'Constant Couple,' which appeared two years afterwards, was played 53 nights in the first season, and was the cause of the favourable reception of a very indifferent sequel which he wrote under the title of 'Sir Harry Wildair.' In 1703 he produced a version of Beaumont and Fletcher's 'Wild-goose Chase,' under the name of the 'Inconstant,' which, though it had small success at the time, was occasionally played at the London theatres a very few years back. He was married in the same year, and getting into great difficulties was forced to sell his commission. Being deceived by a nobleman, who had promised to assist him, he was so deeply affected that he fell into a decline, and died in 1707. During his last illness he wrote his celebrated 'Beaux Stratagem.'

The appearance of Farquhar's comedies may be regarded as an important epoch in the history of the English drama. None of his celebrated predecessors bear any resemblance to him: he was the first of his period to write in an easy flowing style, equally removed from the pedantic stiffness of Congreve and the formal courtly viciousness of the Etherege school. Immoral and licentious as his plays may appear to readers of the present day, those who are conversant with writings of that time must acknowledge them to be considerably more pure than those of his contemporaries, if we except his first piece 'Love and a Bottle.' Let any one who is disposed to be severe upon Farquhar cast his eye for a moment over the gross works of Wycherly, or the obscene and filthy trash of Mrs. Behn; let him compare Farquhar's volatile and airy Sir Harry Wildair with the cold-blooded and brutal Dorimant, held forth by Etherege in the 'Man of Mode' as a model of what a gentleman should be, and then he will measure the former by a right standard. Farquhar attended more to character than most writers of the day: he introduced a variety of classes talking in appropriate language, while the persons of Congreve's drama were but an assembly of professed wits, and those of Etherege and others were only rakes, city dupes, unfaithful wives, and women of the town, most of them speaking pretty much alike. At all events their pieces were marked by only one distinction of character, that between the injurer and the injured, the former of whom was held up as a clever personage, and the latter made to talk like a fool.

It is singular enough that the critics regarded as Farquhar's chef d'œuvre a serious comedy called the 'Twin Rivals,' which has now sunk entirely into oblivion, or at best is only remembered by readers of the old English drama as containing a masterly though disgusting portrait of a procuress, under the name of 'Mother Midnight.' A neat edition of his works was published in 1736.

FARRANT, RICHARD, one of the highly-venerated fathers of English church music, was born in the early part of the sixteenth century. He was a gentleman of the chapel-royal in 1564, and subsequently organist and master of the choristers of St. George's chapel, Windsor. His death is supposed to have taken place about the year 1585. So long as solemn harmony of the purest and finest kind shall find admirers, so long will his service in G minor, and more especially his two anthems, 'Hide not thou thy face,' and 'Call to remembrance,' be productive of the most delightful emotions that can arise out of a love of art combined with religious feeling.

FARRINGDON, a town in Berkshire, in the hundred of Farringdon, and in the parish of Great Farringdon. It is pleasantly situated on an eminence, 36 miles north-west by west from Reading, and 69½ miles west by north from London. It is governed by a bailiff and inferior officers. The market-day is Thursday. There are three annual fairs, viz. on Old Candlemas-Day, Whitsun-Tuesday, and 29th October, besides a statute fair on the 18th October for hiring servants. The Saxon kings had a palace at Farringdon, wherein Edward the Elder died in 925; and a castle was built here during the wars in the reign of Stephen, by the earl of Gloucester, or his son, but was totally destroyed a few years after by Stephen. In 1202 this king founded at Farringdon a priory of Cistertian monks, subject to the abbey of Beaulieu in Hampshire, and here, according to a manuscript in the Bodleian Library, King Henry III., his queen, and Prince Edward passed a night, being entertained at the cost of the abbot of Beaulieu. The expense of the king's entertainment amounted to 100*s.* 6*d.*, the queen's to 75*s.*, and Prince Edward's to 5[illegible]*s.* 6*d.* This priory, like the castle above mentioned, has long since been entirely ruined, and no vestige is left of either of them. During the civil war Cromwell made an attack upon the town, which was successfully resisted by the garrison under Sir Marmaduke Rawdon, whose memory is commemorated by an inscription in the parish church. King Charles was at Farringdon after the second battle of Newbury. Near Radcot Bridge, about

three miles to the north of Farringdon, was fought the battle between Robert Vere, duke of Ireland, and the earl of Derby, afterwards King Henry IV. The parish church, which is dedicated to All Saints, is a large and handsome structure in the Gothic style, and contains many old monuments, described in Ashmole's 'Antiquities of Berkshire' (Lond. 1719). It has a low square tower, formerly surmounted by a spire, which was destroyed during the civil war. The vicarage is in the diocese of Salisbury, and its average net income is 265*l*. The parish of Great Farringdon is partly in the hundred of Farringdon and partly in that of Schrivenham. According to the population returns for 1831, the entire parish contained 3033 inhabitants, and 6910 statute acres. (Lysons' *Magna Britannia; Carlisle's Topographical Dictionary*; Ashmole's *Antiquities; Ecclesiastical Revenues Report*, &c.)

FARS, or FARSISTAN. [PERSIA.]

FARTHING. [MONEY.]

FARTHINGALE, or VARDINGALE, a hoop, a circle of whalebone formerly worn by ladies to spread the petticoat to a wide circumference. Strutt, in his 'Manners and Customs,' vol. iii. pp. 84, 86, tells us that among the men, early in the reign of Queen Elizabeth, the wearing of great breeches was carried to very absurd and ridiculous lengths; and the ladies, that they might not be behind-hand with the gentlemen in fantastical taste, invented the large hoop farthingales as a companion to the trunk-hose or breeches. The farthingale afforded the ladies a great opportunity of displaying their jewels, and the other ornamental parts of their dress, to the utmost advantage, and for that reason obtained the superiority over the closer habits and the more simple imitations of nature.

Bulwer, in his 'Artificial Changeling,' says, when Sir Peter Wych was ambassador to the Grand Signior from King James I., his lady was with him at Constantinople; and the sultaness, having heard much of her, desired to see her; whereupon Lady Wych, accompanied with her waiting-women, all of them neatly dressed in their great farthingales, which was the court-dress of the English ladies of that time, waited upon her highness. The sultaness received her with great respect; but wondering much at the extension of her hips, inquired if that shape was peculiar to the women of England; to which the lady replied, that the English women did not differ in shape from those of other countries; and, by explaining to her the nature of the dress, convinced the sultaness that she and her companions really were not so deformed as they appeared to be. (Strutt's *Habits of the People of England*, vol. ii. pp. 259, 260.)

The farthingale however, if not then, was at least subsequently worn through Europe. The French farthingale had the name of *Hausse-cul;* see Cotgrave. Lascells, in his 'Voyage of Italy,' 12mo., 1655, p. 96, says, 'I found all the great ladies here to go like the donnas of Spain in guardinfantas, that is, in horrible overgrown vertigals of whalebone;' and Pepys, in his 'Diary,' 4to. edit., vol. i. p. 144, notices the strangeness of those worn by the ladies who came over from Portugal with Charles the Second's queen. The hoop, the last remain of the farthingale in England, went out at the beginning of the reign of George IV.

FASCES. [CONSUL; DICTATOR.]

FASCICLE, in botany, is, strictly speaking, that kind of inflorescence in which the flowers are arranged in a flat-headed raceme or corymb, and begin to expand in the centre sooner than at the circumference. The term is however constantly applied to any collection of flowers or leaves in clusters at the end or on the sides of a branch; thus the leaves of the larch are called fasciculate.

FASCICULA'RIA. [MADREPHYLLIŒA.]

FASCINES are bundles of strong brush-wood, employed chiefly for the purposes of reveting the epaulements of batteries and covering the roofs of field-magazines or other blindages, but occasionally to increase the heights of trench parapets, and to make temporary roads over marshy ground.

They are formed by placing the rods side by side in a cradle made of trestles, and compressing them by means of two levers connected by a chain, which is passed round the bundle: the whole is secured by withs or binders, which are placed 18 inches asunder. Fascines are commonly about 8 or 9 inches in diameter, and, when made, are 18 feet long; but they are then, if necessary, cut by the saw into parts of any required lengths, which are generally 6 feet or 12 feet. A fascine of the longest kind is sometimes called a saucisson.

When fascines serve for the revetment of a battery, they are usually laid horizontally, one line above another, against the interior slope of the epaulement, to which they are attached by pickets driven through them into the earth.

FASCIOLA'RIA. [SIPHONOSTOMATA.]

FAST, abstinence from food, more particularly used for such abstinence as a religious observance; from the Anglo-Saxon *fæstan*.

Religious fasting has been practised in almost all ages and all countries. Moses appointed that of the Day of Expiation for the Israelites. Herodotus (ii. 40) and Porphyry give us details of the Egyptian fasts. Among the fasts of the primitive Christians, the greatest was that of Quadragesima, or Lent: but they likewise observed the *Jejunia quatuor temporum*, or fasts of the four seasons.

The fixed days appointed by the church of England for fasting are, first, the Forty days in Lent; second, the Ember days at the four seasons, being the Wednesday, Friday, and Saturday after the first Sunday in Lent, the Feast of Pentecost, September 14th, and December 13th; third, the three Rogation days, being the Monday, Tuesday, and Wednesday before Holy Thursday; fourth, all the Fridays in the year except Christmas-day. The 30th of January is observed as a fast, in repentance for the execution of Charles I.: and other days of fasting are occasionally appointed by royal proclamation. The Long Parliament appointed a fast on the last Wednesday of every month.

Lewis, in his *Antiquities of the Hebrew Republic*, has given from Maimonides many particulars of the Jewish fasts, for which the reader may also consult Ockley's translation of Leo Modena's *History of the Jews*, 12mo., Lond., 1707, p. 150, and D. Levi's *Rites and Ceremonies of the Jews*, 8vo., Lond., pp. 70, 71, 85, 120, 125. For those of the Greek church he may consult Leo Allatius, *De Ecclesiæ Occidentalis atque Orientalis, consensione*, and Ricaut's *Present State of the Greek and Armenian Churches, Anno Christi*, 1678, 8vo. Lond. 1679. For the Mohammedan fasts, Reland *De Religione Mohammedica*, 8vo., Tr. ad Rhen. 1717, ca. x. and D'Herbelot's *Bibliothèque Orientale*, p. 708. The distribution of the fasting days in the present church of Rome will be found in Bishop Challoner's *Garden of the Soul*.

FASTI were marble tables at Rome, on which were inscribed the names of the consuls, dictators, censors, and other principal magistrates of the republic. Fragments of these tables have been collected, and are ranged along the walls of one of the halls in the palace of the Conservatori on the Capitol. The deficiencies in the series of the consuls have been supplied by means of the historians, and by consulting monumental inscriptions. Several learned men in modern times have compiled Fasti, or chronological tables of the Roman consuls. Among the most learned and accurate of these compilers is Sigonio of Modena, who published his 'Fasti Consulares ac triumphi acti a Romulo rege ad Titum Cæsarem,' fol., 1559; with a dissertation 'de nominibus Romanorum,' a work of great erudition and exact criticism. Pighius published 'Annales Magistratuum et Provinciarum S. P. Q. R. ab Urbe condita,' fol., 1599. Labbe, in his 'Bibliotheca Nova,' published Fasti 'Consulares' out of a MS. of the college of Clermont. Other editions of the Fasti have been made from various sources. Between these lists occasional discrepancies occur as to the names of some of the consuls, and the particular years of their consulships; for, notwithstanding the labours of critics and antiquarians, there is still some uncertainty about Roman chronology. The word Fasti is often used as synonymous with the annals, or chronicles of a nation.

The Romans had another kind of Fasti, which they called 'Fasti minores,' a kind of almanacs, in which were registered the periodical festivals, games, official days for business, &c. Ovid wrote a poem explanatory of these Fasti, which he dedicated to Germanicus, and in which he described the origin of the festivals, and the recollections, either happy or calamitous, connected with the various days of each month. The poem, as we have it, is in six books, one for each of the first six months of the year; the rest is unfortunately lost.

FASTING. [ABSTINENCE.]

FAT. This substance varies in properties according to the animals producing it; in all cases however it is composed of two different kinds which differ as to their melting point; these are termed *olein* or *elain* and *stearin*. It is not however to be considered that the substances to which these names

are given are in all cases absolutely identical; they vary as to smell, taste, solubility in alcohol, &c., but all fats agree in being insoluble in water, and in not containing any azote, which is a common constituent of most other animal matter. It has not been decided whether the differences which exist in the properties of the various kinds of olein and stearin are derived from a real difference in their elementary composition, or are owing to an admixture of substances which have not as yet been separated from them. Chevreul has however found, that the olein of the fat of man, the sheep, and the hog, are so similar as to their composition, as to induce the belief that the difference depends upon some accidental admixture. There is nevertheless this difference between human fat and that of the sheep, that the stearin of the latter yields a certain quantity of stearic acid by saponification, whilst the former does not give a trace of it. This peculiarity may be explained by supposing the presence of another kind of stearin, which has not hitherto been separated. Olein and stearin may be separated by dissolving the fat in hot alcohol, from which the stearin separates on cooling: seven-eighths of the fluid are then to be distilled, and, on adding water to the residue, a mixture of a large quantity of olein and a small portion of stearin is precipitated; when this is treated with cold alcohol of sp. gr. 0·84, the olein is dissolved by it, and the stearin left; by distillation the alcohol is separated and the olein remains. We shall now notice the difference existing in the properties of some of the more remarkable kinds of fat.

Human fat varies a little according to the part of the body producing it; that from the region of the kidneys, after it has been melted, is yellowish and inodorous; it begins to concrete at 76° Fahr., and is solid at 64°; it dissolves in forty times its weight of alcohol of 0·821 when boiling, and on cooling stearin is deposited, which, after pressure in bibulous paper at 78°, is colourless, fusible at 122°, and may be cooled to 106° before it begins to congeal; its temperature, on account of the evolution of latent heat, then rises to 120°: 21·5 parts of this stearin are soluble in 100 parts of boiling anhydrous alcohol, the greater part of which separates in acicular crystals on cooling.

The *olein* of human fat is a colourless oily sweetish fluid, and remains so at 40°; at 60° its specific gravity is 0·913: 123 parts of this olein are soluble in 100 parts of boiling alcohol; on cooling to 170° the solution becomes turbid.

Ox fat.—When this has been fused it begins to solidify at 98°, and the temperature then rises, for a reason already mentioned, to 102°. Forty parts of boiling alcohol, of sp. gr. 0·821, dissolve one part of it; and it contains about three-fourths of its weight of stearin, which is solid, hard, colourless, not greasy, and of a granular crystalline texture; it fuses at about 112°, and may then be cooled to 102°, when, on congealing, it rises to 112°. It burns like white wax. Of this stearin about 15·5 parts are dissolved by 100 parts of anhydrous alcohol.

The olein of ox fat is colourless, nearly inodorous, and its specific gravity is 0·913; boiling alcohol dissolves nearly one-fourth more than its weight.

Sheep's fat (or *Mutton suet*) greatly resembles that of the ox; it is however whiter, and by exposure to the air acquires a peculiar odour. After fusion it congeals at a temperature varying between 98° and 102°; it dissolves in 44 parts of alcohol of sp. gr. 0·821. The stearin is white, translucent, and after fusion but imperfectly crystalline; about 16 parts are dissolved by 100 parts of boiling anhydrous alcohol; the olein of mutton suet, is colourless; its specific gravity is 0·913; and 80 parts of it are dissolved by 100 parts of anhydrous alcohol at 168°.

Hog's fat, or *hog's lard*, is a soft colourless solid, which fuses between 78° and 86°; its specific gravity at 60° is 0·938. By powerful and long continued pressure at 42°, between folds of blotting-paper, it is stated to yield $\frac{62}{100}$ its weight of colourless olein, of specific gravity 0·915; of this, 100 of boiling alcohol dissolve 123 parts the stearin of hog's lard is inodorous, solid, and granular, which, after fusion, remains liquid down to 100°, and then on congealing the temperature rises to 109°. It becomes acid by exposure to the air.

Goat's fat contains a peculiar fat, termed by Chevreul *hircin*, and to the presence of this its peculiar odour is owing, and which remains to a great degree with the olein when this is separated from the stearin; by particular management this fat yields hircic acid. [HIRCIC ACID.]

The *fat of birds.*—Goose fat is colourless, and of a peculiar taste and smell; after fusion it congeals at 80° into a soft solid of the consistence of butter. When subjected in bibulous paper to pressure at 30°, 100 parts are separable into 68 of olein, and 32 of stearin, fusible at 112°; the fat of ducks fuses at 76°, and yields 72 olein, and 28 stearin, fusible at 120°; turkey's fat is separable into 74 olein and 26 stearin, fusible at 112°.

The fat of insects has been but slightly examined, and does not offer any very remarkable properties: the fluid fats, whether of animal or vegetable origin, and which are usually termed OILS, will be considered under that head.

The olein and stearin of animal fats are highly useful and important substances in the manufacture of soap and candles; for the latter purpose stearin has been of late very advantageously employed and to a considerable extent as a substitute for wax.

The subjoined analyses of the stearin and olein of mutton suet may be taken as examples of the general constitution of these substances, and will show that their composition is less different than might be expected from their different properties:—

	Stearin.	Olein.
Hydrogen	11·770	11·090
Carbon	78·776	79·354
Oxygen	9.454	9·556
	100·	100·

FA'TA MORGA'NA, a name of uncertain derivation given to a very striking optical delusion which has been principally remarked in the Strait of Messina, between the coasts of Sicily and Calabria. It has been differently described by different observers, which we may attribute to the different states of the atmosphere at the periods of the respective observations. The indications both of the hygrometer and thermometer should have been carefully noted, in order to obtain a precise explanation according to the known laws of optics.

The images of men, of houses, &c. are occasionally seen from the coast, sometimes in the water, and sometimes in the air, or at the surface of the water. The same object has frequently two images, one in the natural and the other in an inverted position: the images of a single object are said also to be sometimes considerably multiplied.

In accounting for this phenomenon, it should be remembered that the mountains on both coasts of the strait nearly inclose a portion of quiescent or stagnant air, the temperature of which near the surface of the water is therefore easily raised above that of the surrounding objects. The rarer medium thus generated causes a depression in the places of the images, in the same manner that a denser medium would elevate them; and the secondary images formed between the air and water are necessarily inverse. The colours which are seen in hazy weather arise from the refraction of light through the small globules of vapour floating above the surface of the water, and would equally accompany any real object, as a ship, under the same circumstances. [MIRAGE.]

The remarks of Minasi, which have been so often copied, in explanation of this phenomenon, are unworthy of attention.

FATALISM. This term is used to express an article of philosophical religion, and usually signifies that the successive actions of mankind, and even the successive operations of the powers of nature, are under the guidance of some superior almighty power, so that these *successions* and the actions themselves are entirely independent of each other.* This doctrine has been embodied in all religious systems, though very different names have been given to the governing power. The Greeks called it *moira* or *ananke*, and the Romans called it *fate*; their mythology also mentions a Demiurgus, who had formed the gods. All the antient religions of Asia recognise a similar fate, something mightier than the gods, to whom it dictates laws; such, for example, as the alternating governments of Ormuzd and Ahrimanes in the Persian mythology, &c. Among the Hebrews the Pharisees were fatalists, the Sadducees materialists, and the Essenes deists. The old Germanic religion of Odin modified this Fate, and brought it nearer to the idea of the government of the world by a deity, identifying it with their highest god, Allfadur (Father of

* Many Psychian physicians (*i. e.* of mental maladies) of modern times maintain the exact contrary, that all the actions of mankind are the effects of circumstances, and that all successive consequences depend on these actions.

all). From this point fate changes to what is called predestination (in opposition to chance), which idea is only a mitigated fate, distinguished however from genuine fatalism in proceeding directly from God, and not from fate. This belief in predestination was taught by Mohammed, and his followers have retained it. Catholicism has no trace of this doctrine, but it is held by the Calvinists, and to a certain extent at least by the church of England.

The doctrine of fatalism, as is well known, has been frequently and effectively used both by antient and modern poets.

Intimately related to fatalism is the doctrine of the immediate and direct intervention of Providence in the government of the world. According to this doctrine the *consequences* of the actions of mankind depend wholly upon the actions themselves; God, however, is able so to conduct these consequences, that collectively they shall result in good, and conformably to his purpose. To comprehend this working precisely is impossible for man, since his mental powers are not sufficiently extensive, and this dogma must therefore be a matter of faith. This doctrine is held by many Christian sects, and in the Bible there are passages strongly in favour of such special intervention; for example, Matthew x. 29, 'Are not two sparrows sold for a farthing? and one of them shall not fall on the ground without your Father.'

The third or deistical interpretation of this doctrine teaches the complete non-intervention of the Deity in the affairs of the world or of mankind: we may also call this doctrine the doctrine of theological chance, which may still be consistent with that of physical necessity, according to Kant. The doctrine of physical necessity was advocated by Hobbes, and served for the foundation of the charges against him of deism and atheism.

If we consider these doctrines in a philosophical point of view we may come to the following results:—The theological theories of fatalism, predestination, the immediate government of God, and his non-intervention, evidently bear an analogical relation to the political systems of despotism, constitutional monarchy, and republicanism. Accordingly as every one may have grounds for being an adherent of one of these political systems, so may he also have grounds for being a follower of one of these theological views. According to the ideas and investigations of the author of this article, God may have positively fixed, before any creation of the world, the eternal ideas, or the relations of things to each other within the circle of which nature and human intelligence have to move. These ideas are (1) for nature, self-preservation, or continuance, of which the product is attraction, &c.; regularity, producing crystallization, &c.; and adaptation to purposes, producing organization, &c.; (2) for human intelligence, self-love, beauty and virtue. In so far as nature and humanity with all their efforts cannot move out of this sphere of ideas, so far fatalism and predestination exist. The efforts of nature to adapt means to ends, and the endeavours of the wise after virtue (or human happiness) appear to produce an ever-increasing progression, and in this sense they constitute an intervention of Providence—since nature being wholly bound, and God absolutely uncontrolled, man stands between both; so that though he is not absolutely free, yet he is free to work his ultimate ends out of himself; he is free whenever he acts morally, and he is not free whenever he acts immorally (or rather physically), and he may thus arrive at the consciousness that his state in another world entirely depends on himself. With this conviction every species of intervention would appear less harsh towards him, and without these grounds he may be doubtful whether any direct intervention exists with respect to worldly affairs.

An intervention of any other kind than that of God would lead to the doctrine of dæmons and spirits.

FATHER. [PARENT AND CHILD.]

FATHERS OF THE CHURCH is the name given to the early teachers and expounders of Christianity, who lived between the second and the sixth centuries of our era, and whose writings are looked upon as possessing considerable authority in matters of faith. The earlier, or 'primitive fathers,' as they are sometimes styled, to distinguish them from the fathers of the fourth and fifth centuries, and, who followed close upon the apostolical age, namely the age in which the Apostles lived and died, are generally reckoned as follows: 1st, Clemens Romanus, bishop of Rome, who died about A.D. 100, and of whom we have an interesting epistle to the church of Corinth. [CLEMENT I.] 2nd, Ignatius, bishop of Antioch, a disciple of the Apostles in his youth, was sentenced to death under Trajan, A.D. 107, and was taken to Rome to be executed, as he informs us in his epistles. He was exposed to the wild beasts in the amphitheatre. There are extant several of his epistles to various churches of the East, and one to that of Rome. His epistle to Polycarp is doubtful. 3rd, Polycarp, bishop of Smyrna, who is said to have conversed with St. John and other Apostles in his youth, and who suffered martyrdom A.D. 167, when he was nearly 100 years old. He is the author of an epistle to the Philippians, which has been printed repeatedly, and is given in Cave's 'Antiquitates Ecclesiasticæ,' vol. i. 4th, Justinus, a native of Neapolis, in Palestine, a man of considerable learning, and a follower of various sects of philosophers. Having embraced Christianity he came to Rome in the time of Antoninus, had a controversy with Marcion, an early heretic, and wrote an eloquent apology for the Christians, which he addressed to Antoninus, and which drew from that emperor a rescript favourable to the Christians. Justinus afterwards returned to the East, where he held a disputation with Tryphon, or Tarphon, a learned Jew: on his return to Rome he had a controversy with Crescens, the philosopher, of which Jerome (*De Scriptis*), and Tatianus, a disciple of Justinus, give particulars. His second apology for the Christians was addressed, as it is believed, to Marcus Aurelius: soon after which he suffered martyrdom at Rome. We have of him, besides his two apologies, a 'Parænesis ad Græcos,' 'Dialogus cum Tryphone Judæo,' 'Epistola ad Diognetum,' and a 'Liber de Monarchia Dei.' 5th, Theophilus, made bishop of Antioch about 169, died about the beginning of the reign of Commodus. There is extant by him a work in three books, addressed to Autolycus, a heathen friend of Theophilus, whom he endeavoured to convert to the Christian faith. 6th, Irenæus, a Greek by birth, and a disciple of Polycarp of Smyrna, came with Polycarp to Rome, and was thence sent to Lyon to assist the aged Photinus, bishop of that city, whom he succeeded A.D. 179. He wrote against the Gnostics and other heretics, and suffered martyrdom under Severus. He is called by Tertullianus 'a very inquisitive explorer of every kind of knowledge.' His principal work, written originally in Greek, but which has come down to us in a Latin translation, is styled 'Adversus Hæreses, seu de Refutatione et Eversione Falsæ Scientiæ, libri v.,' and is directed against the Gnostics. 7th, Clement of Alexandria, who was born about the middle of the second century, died about 220: left numerous works. [CLEMENS, TITUS FLAVIUS ALEXANDRINUS.] 8th, Cyprian, bishop of Carthage, born about the end of the second century, suffered martyrdom about 258. His works are numerous. [CYPRIAN, ST.] He has been confounded by some with Cyprian of Antioch, who suffered martyrdom under Diocletian. 9th, Origen of Alexandria, born A.D. 186, died about 254: wrote numerous works, some of which however contain notions which have been reprobated as heretical. [ORIGEN.] 10th, Gregory, called Thaumaturgus, a native and afterwards bishop of Neo Cæsarea, in Cappadocia, and a disciple of Origen, died soon after the Council of Antioch, which he attended A.D. 264: we have of him a 'Metaphrasis in Ecclesiastem,' a 'Brevis Expositio Fidei,' an 'Epistola Canonica,' and a panegyrical oration to his master Origen, on leaving his school; to which the latter replied by an interesting letter, which is printed in his works. 11th, Dionysius, bishop of Alexandria, also a disciple of Origen, was banished under Valerian to the deserts of Libya, but was restored to his see under Gallienus, was engaged in controversy with Sabellius, Nepos, and Paul of Samosata, and died A.D. 265. Of his numerous writings only fragments remain. 12th, Tertullianus of Carthage, lived under S. Severus, and died at a very advanced age, under Alexander Severus. He is one of the most copious of the Fathers of the Latin church. In the latter part of his life he fell into the errors of the Montanists. [TERTULLIANUS.]

We now come to those Fathers of the Church who flourished in the fourth century, after Christianity had become the religion of the Empire, an age which may be styled the Augustan age of ecclesiastical literature, for the number and the merits of the writers whom it produced. Some account of most of these fathers and their works is given under their respective heads. They are generally ranged in two classes—fathers of the Greek or Eastern

Church, and fathers of the Latin Church. The former are: 1st, EUSEBIUS of Cæsarea, who died A.D. 340; his works give him a place among the fathers, notwithstanding the obloquy which his dubious conduct in the Arian controversy drew upon him. 2nd, ATHANASIUS, bishop of Alexandria, who died in 371. 3rd, Basilius, called the Great, bishop of Cæsarea, in Cappadocia, in the reign of Valens, one of the most eloquent of the Greek fathers, and whose works have been published repeatedly both in Greek and in a Latin translation. 4th, Gregorius Nazianzenus, the friend of Basilius, and for a time patriarch of Constantinople, who afterwards abdicated and ended his days in voluntary banishment A.D. 389. His style is remarkable for a certain poetical imagery which distinguishes him from his brethren. 5th, Gregory, bishop of Nyssa, in Cappadocia, the brother of Basilius, died about 396; he distinguished himself in the Arian controversy. 6th, CYRIL, bishop of Jerusalem, who died A.D. 386, wrote 18 books of sermons and other works. 7th, CHRYSOSTOM, ST. JOHN, patriarch of Constantinople, died in banishment A.D. 407. 8th, EPHIPHANIUS, bishop of Salamis, in Cyprus, died in 403. 9th, CYRIL, bishop of Alexandria, who died A.D. 444, was the great opposer of Nestorius concerning the Incarnation. To the above must be added Ephraim the Syrian, deacon of Edessa, who died about 378, and whose works have been published in the original text by Assemani.

The Fathers of the Latin Church are—1st, LACTANTIUS, who died A.D. 316. 2nd, Hilarius, bishop of Poictiers, who died about 368. He was much concerned in the controversy against the Arians, and wrote several books against Constantius, who patronized them. 3rd, AMBROSE, archbishop of Milan, died in 397. 4th, JEROME, the translator of the Bible, died A.D. 420. 5th, AUGUSTIN, bishop of Hippo, died A.D. 430. With Augustin the list of the great fathers of the church is generally considered as terminating, although this title has been also bestowed on some subsequent prelates and theologians; but these, such as Bernard, Thomas Aquinas, &c., are more properly distinguished by the name of doctors of the church.

The study of the Fathers is interesting not only to theologians, but to those who would examine carefully the philosophy and the state of society in their time. They are now much studied in the Protestant universities of Germany.

FATHOM. [MEASURES.]

FATIMIDES, the name of a race of kings, who assumed the title of caliphs, and reigned for many years over the north of Africa and Egypt. They obtained the name from the pretensions of the founder of the dynasty, Abu Mohammed Obeidallah, who asserted that he was descended from Fatima, the daughter of Mohammed and wife of Ali. The Arabic historians however generally deny the truth of this assertion; and many of them say that his grandfather was a Jew or of the Magian religion. The princes of this family were also called the Aliades, in consequence of their descent, real or pretended, from Ali.

1. Obeidallah, the first Fatimide caliph, was born A.D. 882. Having incurred the displeasure of Moktafi, the reigning Abasside caliph, he was obliged to wander through various parts of Africa, till, through fortunate circumstances, he was raised from a dungeon in Segelmessa (A.D. 910) to sovereign power. He assumed the title of Mahadi, or 'director of the faithful,' according to a prophecy of Mohammed's that in the space of 300 years such an individual would arise in the west. He subdued the princes in the north of Africa, who had become independent of the Abassides, and established his authority from the Atlantic to the borders of Egypt. He founded Mahadi on the site of the antient Aphrodisium, a town on the coast of Africa, about a hundred miles south of Tunis, and made it his capital. He became the author of a great schism among the Mohammedans by disowning the authority of the Abassides [ABASSIDES], and assuming the title of Emîr al Mûmenîn, 'prince of the faithful,' which belonged exclusively to the caliphs. His fleets ravaged the coasts of Italy and Sicily, and his armies frequently invaded Egypt, but without any permanent success.

2. Caiem succeeded his father A.D. 933. During his reign an impostor, Abu Yezid, originally an Ethiopian slave, advanced certain peculiar doctrines in religion, which he was enabled to propagate over the whole of the north of Africa, and was so successful in his military expeditions as to deprive Caiem of all his dominions, and confine him to his capital, Mahadi, which he was besieging when Caiem died.

3. Mansour succeeded his father (A.D. 946) when the kingdom was in a state of the greatest confusion. By his valour and prudence he regained the greater part of the dominions of his grandfather Obeidallah, defeated the usurper Yezid, and laid the foundations of that power which enabled his son Moez to conquer Egypt.

4. Moez (A.D. 955) was the most powerful of the Fatimide caliphs. He was successful in a naval war with Spain, and took the island of Sicily; but his most celebrated conquest was that of Egypt, which was subdued by his lieutenant A.D. 972. Two years afterwards he removed his court to Egypt, and founded Cairo. (See D'Anville's *Mémoires sur l'Egypte*, p. 132.) The name of the Abasside caliph was omitted in the public prayers, and his own substituted in its place; from which time the great schism of the Fatimide and Abasside caliphs is more frequently dated than from the assumption of the title by Obeidallah. The armies of Moez conquered the whole of Palestine and Syria as far as Damascus. The Arabic historians greatly extol the virtues of this caliph.

5. Aziz (A.D. 978). The dominions recently acquired by Moez were secured to the Fatimide caliphs by the wise government of his son Aziz, who took several towns in Syria. He married a Christian woman, whose brothers he made patriarchs of Alexandria and Jerusalem.

6. Hakem was only 11 when he succeeded his father, A.D. 996. He is distinguished even among oriental despots by his cruelty and folly. His tyranny caused frequent insurrections in Cairo. He cruelly persecuted the Jews and Christians, and burnt their places of worship. By his order the church of the resurrection at Jerusalem was destroyed (A.D. 1009). His persecution of the Christians led them to appeal to their brethren in the West, and was one of the causes that led to the crusades. His folly induced him to become the founder of a new religion, and to assert that he was the express image of God. He was assassinated in consequence of the intrigues of his sister, and was succeeded by his son

7. Dhaher (A.D. 1021). He was not so cruel as his father, but was addicted to pleasure, and resigned all the cares of government to his vizirs. In his reign the power of the Fatimide caliphs began to decline. They possessed nothing but the external show of royalty: secluded in the harem, they were the slaves of their vizirs, whom they could not appoint and dared not disobey. In addition to the evils of misgovernment, Egypt was afflicted in the reign of Dhaher with one of the most dreadful famines that ever visited the country.

8. Mostanser (A.D. 1037) was only nine when he succeeded his father. The Turks invaded Syria and Palestine in his reign, took Damascus and Jerusalem (A.D. 1076), where the princes of the house of Ortok, a Turkish family, established an independent kingdom. They advanced to the Nile with the intention of conquering Egypt, but were repulsed.

9. Mostali (A.D. 1094), the second son of Mostanser, was seated on the throne by the all-powerful vizir Afdhal. The government was entirely in the hands of Afdhal during the whole of his reign. The invasion of Asia Minor by the crusaders (A.D. 1097) appeared to Afdhal a favourable opportunity for the recovery of Jerusalem. Refusing to assist the Turks against the crusaders, he marched against Jerusalem, took it (A.D. 1098), and deprived the Ortok princes of the sovereignty which they had exercised for twenty years. His possession of Jerusalem was however of very short duration, for it was taken in the following year (A.D. 1099) by the crusaders. Anxious to recover his loss, he led an immense army in the same year against Jerusalem, but was entirely defeated by the crusaders near Ascalon.

10-13. The reigns of Amer (1101-1129), Hafedh (1129-1149), Dhafer (1149-1154), Faiez (1154-1160), contain nothing worthy of notice. During their reigns the power of the Fatimides rapidly decayed.

14. Adhed (1160) was the last caliph of the Fatimide dynasty. At the commencement of his reign Egypt was divided into two factions, the respective chiefs of which, Dargham and Shawer, disputed for the dignity of vizir. Shawer implored the assistance of Noureddin [NOUREDDIN], who sent an army into Egypt under the command of Shiracouh, by means of which his rival was crushed. But becoming jealous of Noureddin's power in Egypt, he solicited the aid of Amauri, king of Jerusalem, who marched into Egypt and expelled Shiracouh from the country. Noureddin soon

sent another army into Egypt under the same commander, who was accompanied by his nephew, the celebrated Saladin. [SALADIN.] Shiracouh was again unsuccessful, and was obliged to retreat. The ambition of Amauri afforded shortly afterwards a more favourable opportunity for the reduction of Egypt. Amauri, after driving Shiracouh out of the country, meditated the design of reducing it to his own authority. Shawer, alarmed at the success of Amauri, entreated the assistance of Noureddin, who sent Shiracouh for the third time at the head of a numerous army. He repulsed the Christians, and afterwards put the treacherous vizir to death. Shiracouh succeeded to his dignity, but dying shortly after, Saladin obtained the post of vizir. As Noureddin was attached to the interests of the Abassides, he gave orders for the proclamation of Most-hadi, the Abasside caliph (A.D. 1171), and for depriving the Fatimides of the caliphate. Adhed, who was then on a sick bed, died a few days after, ignorant, as it is said, of his loss.

(Mill's *History of Muhammedanism*, pp. 134-143; Mill's *History of the Crusaders*, vol. i.; D'Herbelot's *Bibliothèque Orientale*, articles 'Fathemiah,' 'Obeidallah,' 'Hakem,' 'Adhed,' 'Saladin,' &c.; Gibbon's *Decline and Fall*, cc. 57, 58, 59.)

FAULT. [MINING.]

FAUN, FAUNUS, was the name given in the Roman mythology to the gods or genii of the woods, corresponding with the Panes of the Greek mythology. The Fauni were supposed to be the descendants of Faunus an old mythical king of Latium, who resided in the forest Albunea with his wife Fauna or Fatua, near the pond of sulphureous water, which is between Rome and Tivoli; both were gifted with the faculty of prophesying. In subsequent ages the forest of Albunea continued to be the Delphi of Latium; the oracles were delivered by a voice issuing from its recesses. (Virgil, *Æneid*, vii. 82, &c.) Several statues in the Italian and other museums are believed to represent Fauni; among the most remarkable are those in the gallery of Florence, and a very handsome one in the museum of the Capitol. The sleeping Faun of the Barberino is now in the gallery at Münich.

FAUSSE-BRAYE, a name given to the rampart which is sometimes formed on the exterior of and parallel to that which constitutes the principal enceinte of a fortress.

In the antient fortifications a bank of earth was frequently raised in the ditch, nearly or quite contiguous to the wall of stone or brick surrounding the place, in order to protect the latter against the battering-engines of the besiegers; and the Italian engineers of the sixteenth century make mention of a detached wall of masonry similarly situated, which seems to have been intended for a like purpose. This was then called a *fossa-brea*, and, subsequently, by the French engineers, a *fausse-braye*; the first term indicating a covering work in the ditch, and the other simply a secondary or advanced rampart.

In and immediately before the time of Vauban the fausse-braye constituted the exterior part of the general rampart of a fortress; its terreplein, or upper surface, was situated a little above the level of the natural ground, and it carried a parapet for the protection of the defenders. The terreplein and parapet of the interior part of the rampart were several feet higher than those of the fausse-braye, and the interval between the two parapets was sometimes broad enough to allow room for artillery.

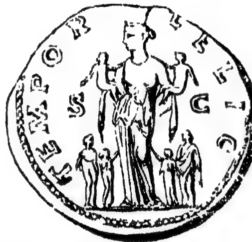
A good indication of the nature of this work may be obtained from the lower flanks of the bastions at Portsmouth, and, in order to render the example complete, it is merely necessary to suppose their parapets continued along the curtains and before the faces of the bastions.

The fausse-braye, thus formed, was intended for the defence of the ditch and covered way by a closer and more grazing fire than that of the principal rampart; but the enfilading fire to which the parts in front of the bastion were liable, and the destructive effects of the shells and grenades thrown into the work by the enemy, rendered it impossible for the defenders to remain in it at the time when their services were most required; it also afforded to the enemy some facilities in escalading the rampart. On account of these defects, this kind of fausse-braye has been long since suppressed, and the use of it in defending the ditch is supplied by the tenaille. [BASTION, *Fig.* 1, p. 17.] It should be observed however that Carnot and other French engineers have recently proposed constructions which may be considered as partial revivals of the fausse-braye, but with circumstances which appear to render the work free from the defects above mentioned.

FAUST, DR., a German scholar in the beginning of the fifteenth century, who is not, as is frequently supposed, the same person as Fust, the assistant of Guttenberg. The popular traditions of Northern Germany give very strange accounts of this man, which are somewhat confirmed by contemporary chroniclers, and represent him as having been in the possession of supernatural secrets, of a magic cloak, and other conjuring apparatus: he was said to have commanded the elements, and to have performed the greatest wonders, with the aid of his associate the devil, who at last carried him off. The simple fact is, that Dr. Faust being far in advance of his contemporaries in the physical sciences, made experiments, the results of which must have appeared superhuman to the narrow understandings of the people. But the poetical personification of the character which has gradually developed itself is much more interesting than the historical personage. Some of the greatest poets of Germany have represented Faust as a man inflamed by the most ardent desire for knowledge, who, after having devoted himself for many years to intense study, arrives at the conviction that the depths of truth are inaccessible to the human understanding. The despair of a mind thus disappointed, and the fiction of the use of magic to get admission to the forbidden regions of knowledge, impart to this character a particularly romantic charm. The idea itself is very old, and may be clearly traced to a primitive age. The circumstance that the wandering Punch and Judy showmen, those rude fathers of the drama in Germany, and even in France, have for centuries made, and are still making, the subject of Dr. Faust's deeds and descent to hell the favourite entertainment of their auditors, proves how well adapted this character is to dramatic action. In modern times, Lessing, the originator of German dramatic art, undertook to dramatise the subject; it was an undertaking grand in conception and plan, but unfortunately it has remained a fragment. The same idea however was taken up by Göthe, the greatest poet that Germany has yet produced. The following are the leading features of Göthe's work:—Faust, doctor and professor in all the faculties, highly admired for his wisdom, carries in his breast the conviction of the insufficiency of his knowledge to reach the fountain of truth. Accordingly he has recourse to magic. At his command appears the Erdgeist, the symbol of the original power which vivifies all matter, directs its motions, and its organic conformation and action. The spirit proceeds to explain to Faust its mode of creation and of action; but the limited human understanding is incapable of conceiving the immensity of the spirit, who disappears and leaves Faust in despair. Faust now resolves to release himself by death from all material forms, and to enter the secret regions of knowledge. But the moment he puts the deadly cup to his lips, the tolling of bells, the sound of the organ, and sweet chanting fall on his ears, and bring back to his mind such charming recollections of infancy and of earthly delights, that he cannot summon resolution to shake off the chains of existence. While he is still irresolute and doubtful, in the comfortless weariness of all human knowledge, the devil appears (the negative and destructive principle in opposition to the vivifying and creating), and Faust, recollecting his impotence when in presence of the Erdgeist, resolves to enter into a compact with the reprobate spirit; not with the expectation of satisfying his longing after knowledge, for he knows that the human mind, notwithstanding its narrow limits, rises higher and is more closely allied to truth than the evil spirit; neither is it his intention to obtain enjoyment by his agency, as the pleasures of the world have no charm for the man who is eager after truth; but the object which Faust contemplates in this union is constant uninterrupted activity. To be continually agitated by the conflict of the ever-changing elements of life is the only thing which can offer any compensation to man for knowledge which is denied. But whoever deserts the province of inquiry and plunges into the stream of life is unavoidably drawn into the vortex of sensuality, and as soon as the intellect of man loses its empire, he is carried into the abyss of material existence. This is the fate of Faust. The first volume of the work, published about twenty years previous to the second, leaves Faust degraded and sunk in sensuality, and struggling in vain to emerge from it. Instead of following up the conflict of the two opposing principles (the one spiritual and vivifying, the other mate-

rial and destroying), and of exemplifying the triumph of the former clearly and impressively, Göthe, who was then far advanced in years, gave shortly before his death, in the second volume (in which his glowing genius manifests itself most conspicuously), only mystical and fragmentary hints, instead of the forcible exposition of which the character is capable. The same subject has been dramatically treated by Klingemann and Röder, but their productions are far beneath Göthe's.

FAUSTI'NA, ANNIA, was the daughter of Annius Verus, præfect of Rome; she married Antoninus before his adoption by Hadrian, and died in the third year of her husband's reign, 36 years of age. She left only one surviving child, named Faustina. The historians have represented her conduct as very licentious. [ANTONINUS PIUS.]



Coin of Faustina the Elder.
British Museum. Actual Size. Copper. Weight, 346¼ grains.

FAUSTI'NA the Younger, daughter of the preceding, married her cousin Marcus Aurelius, and died, A.D. 176, in a village of Cappadocia at the foot of Mount Taurus, on her husband's return from Syria. She is represented by Dion and Capitolinus as even more profligate in her conduct than her mother, and yet Marcus in his *Meditations* (i. 17) extols her obedience, simplicity, and affection. Her daughter Lucilla married Lucius Verus, whom Marcus Aurelius associated with him in the empire, and her son Commodus succeeded his father as Emperor. [AURELIUS, MARCUS.] J. Marchand (*Mercure de France*, 1745) and Wieland have attempted to clear this princess of the imputations against her character.

Coin of Faustina the Younger.
British Museum. Actual Size. Copper. Weight, 395½ grains.

FAWKES, GUY. During the latter years of the reign of Queen Elizabeth the Protestants, who, since the death of Mary, had so increased in numbers and in power as to govern the kingdom as they would, endeavoured, by the severity of laws enacted against Roman Catholics, and by continual oppression, to extirpate that religion from England. 'Not only were the Catholics forbidden to use the rites and ceremonies of their own faith, but were required to attend upon the services of a church which, if conscientious and consistent, they were bound to abhor. If they refused or forbore to come to a Protestant church on the Sabbath, they were liable to a penalty of 20*l*. for every lunar month during which they absented themselves.' Every priest who said mass, and every person who heard it, was liable to a fine of 100 marks, and imprisonment for a year. 'The ministers of their religion, without whose presence they were precluded from the exercise of the sacraments and other rites, were in effect proscribed and banished; for by a statute passed in 1585 it was enacted "that all Jesuits, seminary and other priests, ordained since the beginning of the queen's reign, should depart out of the realm within forty days after the end of that session of parliament, and that all such priests or other religious persons ordained since the same time should not come into England, or remain there under the pain of suffering death as in case of treason." It was also enacted by the same statute that all persons receiving or assisting such priests should be guilty of a capital felony.' It may be truly said that these and other rigorous statutes were not at *all times* enforced; but they placed the whole body of the Catholics at the mercy of the Protestant government: for them therefore there was no liberty, personal or religious, but such as the privy council thought proper to allow; and with reference to their religion, the law gave them no rights, and afforded them no protection.

The facts, that James I., although himself a Protestant, was born of Catholic parents, had been baptized by a Catholic archbishop, and approved several of the ordinances of the Roman church, gave to the Catholics at his accession hopes of a revival of their liberties. At first, indeed, it appeared that their wishes would be realised, and the severity used toward them relaxed, for the fines paid by the recusants, which in the last year of Elizabeth had amounted to 10,333*l*., in the first year of James's reign scarcely exceeded 300*l*., and in the second they were little more than 200*l*. James however was no sooner firmly seated upon the throne than he overthrew all their expectations. In February, 1604, he assured his council that 'he had never any intention of granting toleration to the Catholics,' that he would fortify the laws against them, and cause them to be put into execution to the utmost.

We must refer to the 2nd vol. of 'Criminal Trials,' from which this article is extracted, for a fuller account of the enactments made at this time against the Catholics: sufficient has been said to show the cause of their discontent with the government, the king, and the Protestants in general. The design of blowing up the House of Lords with gunpowder at the opening of parliament, and thus destroying at a single blow the King, the Lords, and the Commons, was formed about the summer of 1604. The conceiver of this desperate and bloody vengeance was Robert Catesby, a Catholic, the son of Sir William Catesby, who had been several times imprisoned for recusancy. Catesby disclosed his scheme to John Wright and Thomas Winter, the former descended from a respectable family in Yorkshire, the Wrights of Plowland in Holderness: the latter from the Winters of Huddington in Worcestershire, where they had been in possession of estates since the time of Henry VI. At a conversation held between these conspirators, it was agreed that Winter should go over to the Netherlands to meet Velasco, constable of Castile, who had arrived at Flanders on his way to England, to conclude a peace between James and the king of Spain, and request him to solicit his majesty to recal the penal laws against the Catholics, and to admit them into the rank of his other subjects. Winter received no encouragement from Velasco that he would stipulate in the treaty of peace for the liberties of the English Catholics, and so returned to England, having in company Guido or Guy Fawkes, who, it was thought, would be of assistance in the business. Fawkes was a gentleman of good parentage and respectable family in Yorkshire; his father, Edward Fawkes, was a notary at York, and held the office of registrar and advocate of the Consistory Court of the Cathedral. Of his education and early history nothing is known; but having spent the little property that he derived from his father, he enlisted in the Spanish army in Flanders, and was present at the taking of Calais by the Archduke Albert in 1598. Soon after Winter's return to London, Thomas Percy, the relation and confidential steward of the Earl of Northumberland, joined the four conspirators already mentioned, and the following oath of secrecy was administered to each, kneeling with his hands placed upon the Primer:—'You swear by the blessed Trinity, and by the sacrament you now propose to receive, never to disclose directly or indirectly, by word or circumstance, the matter that shall be proposed to you to keep secret, nor desist from the execution thereof until the rest shall give you leave.' They then heard mass, and received the sacrament from Father Gerard in confirmation of their vow. Percy took the next step. He was a gentleman pensioner, and upon pretence that it would be convenient to him when in attendance in that capacity, he purchased of one Ferris the remainder of a short term which he had in the lease of a house adjoining the parliament house.

Fawkes, who was unknown in London, and had assumed the name of Johnson, acted as Percy's servant, and took possession of the house. Parliament was soon afterwards adjourned till the 7th of February, and the conspirators having first hired a house in Lambeth for the preparation of timber for the mine and a place of deposit for combustibles, agreed to meet in London about the beginning of November. The custody of the house in Lambeth was committed to Robert Keyes, the son of a Protestant clergyman in Derbyshire, but himself a Catholic; the oath of secrecy was administered to him also. The proceedings of the star chamber during the interval of their meetings so exasperated the conspirators that they became more eager than ever about the plot. Catesby and his confederates, according to a previous agreement, assembled in the house about the 11th of December, and a mine was immediately commenced. The stone wall, however, which separated them from the Parliament House being found three yards in thickness, Keyes and the younger brother of John Wright (who was enlisted as the others had been) were called in to assist, and the seven men were thus occupied until Christmas-eve without their ever appearing in the upper part of the house. During their laborious employment they had much consultation respecting the scheme to be adopted. It was supposed that Prince Henry would accompany the king to the Parliament House and perish there with his father. The Duke of York, afterwards Charles I., would then be the next heir, and Percy undertook to secure his person, and carry him off in safety as soon as the fatal blow was struck. If this scheme should fail, the princess Elizabeth was to be surprised and secured by a party provided in the country. It was the intention to proclaim one of the royal family as king. It was also arranged that Warwickshire should be the general rendezvous, and that supplies of horses and armour should be sent to the houses of several of the conspirators in that county, to be used as occasion might require.

In the midst of these deliberations Fawkes brought intelligence that the parliament had again been prorogued from the 7th of February to the 3rd of October following. The conspirators therefore separated for a time; and in the mean while John Grant of Norbrook in Warwickshire, and Robert Winter of Huddington, were sworn in among their number. In February (1604-5) their labours were resumed, and the stone wall nearly half broken through. One morning while working upon the wall, they suddenly heard a rushing noise in a cellar nearly above their heads. At first they feared they had been discovered; but Fawkes being despatched to reconnoitre, found that one Bright to whom the cellar belonged was selling off his coals in order to remove. Fawkes carefully surveyed this large vault situated immediately below the House of Lords, and perceived its fitness for their purpose. The difficulties connected with breaking through the wall, its thickness, the damp of the situation, for water was continually oozing through the stone work, and the danger of discovery from noise, disposed the confederates to abandon their operations, and to possess themselves of the cellar of Bright. The vault was immediately hired, and about twenty barrels of powder were carried by night from Lambeth: iron bars and other tools that had been used in mining were also thrown among the powder that the breach might be the greater, and the whole was covered over with faggots. Lumber of various kinds was placed in the cellar to prevent any suspicion of the curious or the watchful. In May, 1605, the preparations were complete: the conspirators having marked the door, in order that it might be seen if any one entered the vault, consented to separate; before their separation, however, it was proposed that an attempt should be made to obtain foreign co-operation by informing Sir William Stanley and Owen of the project. This was agreed to on condition of their being sworn to secrecy, and Fawkes was despatched to Flanders for the purpose of conferring with them. Sir Edmund Baynham was also sent on a mission to the pope, that when the news of the explosion arrived at Rome he might be prepared to negotiate on behalf of the conspirators, and to explain that the design of the plot was the re-establishment of Catholicism. Soon after Fawkes's return from Flanders the parliament was further prorogued from October to the 5th of November. These repeated prorogations alarmed the conspirators, and led them to fear that their project was suspected. Their alarms however having been discovered to be groundless, Catesby purchased horses, arms, and powder, and under the pretence of making levies for the archduke in Flanders, assembled friends who might be armed in the country when the first blow was struck. As considerable sums of money were necessary for these purposes, it was proposed to admit into the confederacy three wealthy men, Sir Everard Digby [DIGBY], Ambrose Rookwood of Coldham Hall in Suffolk, and Francis Tresham, the son of Sir Thomas Tresham of Rushton in Northamptonshire. These gentlemen were afterwards sworn in.

As the day of meeting of parliament approached, it was finally determined that Fawkes should fire the mine with a slow match, which would allow him a quarter of an hour to escape. Sir Everard Digby was to assemble a number of Catholic gentlemen in Warwickshire on the 5th of November under pretence of a hunting party, and Percy was to seize the prince of Wales, or the duke of York if the prince should go to the parliament house with the king. One subject of discussion only arose, whether and how the Catholic peers should be warned of their danger: each conspirator had friends, if not relations among them; but the danger of communicating the project to so large a number of persons was considered so imminent, that they despaired of saving all of them, and it was concluded that no express notice should be given them, but only such persuasion, upon general grounds, as might deter them from attending. Many of the conspirators were averse to this advice and angry at its adoption; and Tresham in particular, for his sisters had married Lords Stourton and Mounteagle. Indeed Tresham so passionately required that Lord Mounteagle should have warning of his danger, that very high words ensued; and when he was thwarted in his wishes, he hinted that the money which he had promised would not be forthcoming; and from this time he ceased to attend their councils.

On Saturday, the 26th of October, ten days before the meeting of parliament, Lord Mounteagle unexpectedly gave a supper in a house which he had not lately occupied. Circumstances have given rise to a belief that he was privy to the plot at the time that he invited his friends, and that the supper was only given as a convenient opportunity of discovering the conspiracy to them. Be this as it may, whilst he was at table a letter was brought to him by one of his pages, who stated that he had received it in the street from a stranger, who pressed its instant delivery into his master's hands. The letter ran thus:—'My lord out of the love i beare to some of youer frends have a caer of youer preservacion therefor i would advyse yowe as yowe tender youer lyf to devyse some exscuse to shift of youer attendance at this parleament for God and man hathe concurred to punishe the wickednes of this time, and thinke not slightlye of this advertisment but retyere youre self into youre contri wheare yowe may expect the event in safti for thowghe theare be no apparance of anni stir yet i saye they shall receyve a terrible blowe this parliament and yet they shall not seie who hurts them, this councel is not to be contemned because it may do yowe good and can do yowe no harme for the dangere is passed as soon as yowe have burnt the letter, and i hope God will give yowe the grace to mak good use of it to whose holy protection i commend yowe.' 'To the right honorable the Lord Mounteagle.' This letter has been ascribed to Anne, the daughter of Lord Vaux, to Mrs. Abington, Lord Mounteagle's sister, to Percy, and to others; but there seem greater reasons for believing that no one of these was the writer of it, but rather that Tresham was its author. It is a point, however, we have not room to discuss, and therefore must refer the inquiring reader to *Criminal Trials* (vol. ii. p. 66) for further remarks upon it.

On the same evening Lord Mounteagle showed the letter to several lords of the council, who with him agreed that no steps should be taken until the king returned from hunting at Royston. The contents of the letter and its communication to many of the council, as well as to the secretary of state, soon reached the ears of the conspirators; but though their danger was evident, and the vessel which was to convey Fawkes to Flanders was lying in the river, they made no attempt to escape. All suspected Tresham to be their betrayer, and he was accused by them, but he vehemently denied the accusation. Since they did not know accurately to what extent their proceedings had been divulged, they had still hope of effecting their design, especially as, upon examination, Fawkes found that the cellar was not watched, and had not been disturbed. When,

however, they heard that on the 31st of October the letter had been shown to the king, their hope diminished and their fears increased. Some of the conspirators left London; others concealed themselves in an obscure lodging; all held themselves ready to start at a moment's warning. Fawkes alone, with the extraordinary courage which he had displayed throughout the transaction, took up his station in the cellar. Thus they passed three days of anxiety and suspense. On Monday the chamberlain, with Lord Mounteagle, commenced the search, which appears to have been somewhat strangely delayed. Their suspicions were excited both at finding that Percy was the occupier of a house of which he was known to make no use, and at the unaccountably large store of fuel which filled the cellars, and by the side of which a tall dark suspicious-looking man (Fawkes) was standing. They therefore gave orders to Sir Thomas Knevet, a magistrate in Westminster, to search the houses, the cellars, and the whole neighbourhood. The search was commenced, and about twelve o'clock on the night of the 4th Fawkes was seized as he came out of the cellar: matches and touchwood were found upon his person, a dark lantern with a lighted candle stood behind the cellar door, and under the faggots 36 casks of gunpowder. Fawkes at once avowed his purpose to the magistrate, and declared that 'if he had happened to be within the house when he took him, he would not have failed to have blown him up, house and all.' His courage and composure were not disturbed when he was examined before the king and council. He gave his name as John Johnson, the servant of Thomas Percy, declared his intention to blow up the king, lords, and bishops, and others who should have assembled at the opening of the parliament, refused to accuse any one as his accomplice, and upon being asked by the king how he could enter upon so bloody a conspiracy against so many innocent persons, declared that 'Dangerous diseases require a desperate remedy.'

After having received the news of the apprehension of Fawkes, it was agreed by the conspirators, who had assembled at Ashby Ledgers, to take up arms with the few followers they could collect, and to endeavour to excite to rebellion the Roman Catholics in the counties of Warwick, Worcester, and Stafford, together with those of Wales. This scheme was immediately adopted; arms and horses were seized upon, and different parties despatched over the country. But all their efforts were in vain [DIGBY], and the failure of the project so complete, that their proceedings served no other purpose than to point them out as members of the confederacy. A party of the king's troops pursued some of the conspirators to Holbeach, and here an obstinate defence was made, in which the two Wrights, Percy, and Catesby were killed, and Rookwood and Thomas Winter wounded. The others were eventually taken. Tresham died a natural death in prison, and on the 27th January, 1606, eight persons, namely, Robert Winter, Thomas Winter, Guy Fawkes, John Grant, Ambrose Rookwood, Robert Keyes, and Thomas Bates, were tried at Westminster by a special commission, for being concerned in the powder-plot. Sir Everard Digby was arraigned and tried separately for the same crime. Upon the trials no witness was orally examined: the evidence consisted of the written declarations of Digby's servant and of the prisoners themselves. There is reason to believe that Fawkes was tortured in order to make him confess more fully. All the prisoners were found guilty, and upon all the sentence of death was passed. Care was taken to render their execution, which took place on the following Thursday and Friday, as solemn and impressive as possible.

Of the implication of the Jesuits in this conspiracy we shall speak in the article GARNET.

The atrocity of the design and the extent of the mischief contemplated form the principal features of the gunpowder-plot. It is also remarkable for having been imagined and contrived, not by needy and low-born adventurers, but by gentlemen of good family and for the most part ample fortune. Its effect continued long to be felt; for it not only determined the feeble and wavering mind of the king against the Roman Catholics, but prejudiced the whole nation against them to such an extent, that not only were the severe acts then in force against them left unrepealed, but others equally harsh were enacted. (Abridged and extracted from *Library of Entertaining Knowledge, Criminal Trials*, vol. ii.)

FAWN. [DEER, Vol. viii. p. 358.]

FAYAL is one of the Azores or Western Islands. It is situated in 38° 30′ N. lat. and near 29° W. long., and is more than 24 miles long from east to west. Like the other Azores, it has an uneven surface, and in some places the hills rise into mountains. Though the soil is rocky, it is very fertile, and vegetation is favoured by the mildness of the climate. The island grows firs and palms, pine-apples, oranges, cabbages, and potatoes; but the principal object of agriculture is the vine. In good seasons, from 8000 to 10,000 pipes of wine are exported, chiefly for America; oranges are sent to England and corn to Brazil. Its harbour, Horta, is the best in the whole group. Boats alone can land on the adjacent islands of Pico, Flores, and Corvo; and the produce of these islands is accordingly brought to Fayal for exportation. Fayal has also the advantage of lying directly in the track of European ships homeward bound from South America and India, and is visited by many vessels for provisions or refitting. Its capital, Horta, sometimes but improperly called Fayal, is a pretty little town with 5000 or 6000 inhabitants; it is the place of export for the product of this and the neighbouring islands.

FAYETTE, MARIE MAGDELAINE DE LA VERGNE, Countess de la, was the daughter of an officer and a nobleman of Provence. She took lessons in Latin of Ménage and Father Rapin, and soon made great progress in that language. In 1655 she married Francis Count de la Fayette, and her house became the rendezvous of the literary men and the wits of the age. Lafontaine, Ménage, Huet, and Segrais were her most frequent visitors. The Duke de la Rochefoucault, celebrated for his wit and his licentiousness, became acquainted with her, and she boasted afterwards of having contributed to his reformation. Madame de Sevigné, in her letters, speaks highly of the moral character of Madame de la Fayette as well as of her talents. She wrote several novels which obtained a high reputation at the time, being the first of the kind in France written in a natural style, and free from the exaggerations and affectation of former novelists. She also wrote:—1. 'Mémoires de la Cour de France, pour les années 1688-89,' which contain some curious particulars. 2. 'Divers Portraits de quelques Personnes de la Cour,' being true sketches of living characters. 3. 'Mémoires de Henriette d'Angleterre,' not so interesting as the other two. Madame de la Fayette left also other memoirs of contemporary history which have not been published. Her printed works were collected and published together in 8 vols. 12mo., Paris, 1786, with a notice of her life, and again in 1804, together with the works of Madame de Tencin. Her correspondence was published in 1805. Madame de la Fayette died in 1693.

FAYETTE, GILBERT MOTTIER, Marquis de la, was born on the 1st of September, 1757, at Chevagnac, near Brioude, in the present department of the Haute Loire. He married at the age of sixteen Mademoiselle de Noailles d'Ayen, and his wife's relations offered him a place at court, which he refused. When the American revolution broke out, La Fayette, who was deeply interested in the cause, made an offer of his services to Benjamin Franklin, which being accepted, he armed a vessel at his own expense and landed at Charlestown in April, 1777. He fought as a volunteer at the battle of the Brandywine on the 11th of September, 1777, in which he was wounded. Congress having given him a brevet of major-general, he served in the north under Washington's orders, and was at the battle of Monmouth in June, 1778, and afterwards received the thanks of Congress for his gallant conduct, and the present of a valuable sword. In 1779 he returned to France, the government of that country having acknowledged the independence of the American States, and he obtained assistance in men and money, with which he returned to America. In 1780 he commanded the advanced guard of Washington's army; and in the following year he was intrusted with the defence of Virginia against Lord Cornwallis. Being joined by Washington and Rochambeau, he contributed to the operations in consequence of which Lord Cornwallis was obliged to capitulate at York Town. After the surrender of Cornwallis he returned to France for fresh reinforcements, but the peace of 1783 prevented his sailing back to America. He however revisited that country some years after, and was received in triumph by its grateful citizens, whose independence he had powerfully contributed to establish. After his return to France he travelled through Germany, and was received with marked distinc-

tion by Frederick the Great and Joseph II. of Austria. In 1787, being returned a member of the Assembly of Notables, he advocated the abolition of the lettres de cachet and of state-prisons, and he supported the claims of the Protestants of France, who were still labouring under civil disabilities. He also supported the convocation of the States-General of which assembly he was returned a member. In this capacity he supported Mirabeau's motion for the removal of the military from the neighbourhood of the capital; and in July, 1789, he proposed the first declaration of rights, which formed the basis of the following constitution. In the same month, being appointed commandant-general of Paris, he organized the national guard, and distributed among the soldiers a tricoloured cockade, namely, blue and red, the colours of the commune of Paris, and white, the colour of the lilies of France, and these became thenceforth the national colours. On the 15th of October of that year he marched at the head of the national guard to Versailles, where a tumultuous multitude had preceded him: he was probably the means of saving the lives of the king and the royal family on that occasion, by escorting them back to Paris, whither the Assembly also removed their sittings. He voted in the Assembly for the institution of the jury, for the suppression of hereditary nobility, for the political equality of all citizens, &c. Mistrusting the effects of individual ambition in revolutionary times, he moved and carried a resolution to the effect that the same person should not have the command of the national guards of more than one department at once. He himself refused the appointment of lieutenant-general of the kingdom. In conjunction with Bailly he instituted the club of the Feuillans, which supported the constitutional monarchy on a popular basis. After the king's forced return from the flight of Varennes, La Fayette supported the decree by which the king was restored to the exercise of his regal office on swearing to the new constitution. Upon this the republican party broke out into an insurrection, which La Fayette and the national guards put down on the Champ de Mars. Soon afterwards La Fayette gave in his resignation and retired into the country; but the war of the first coalition having begun, he was appointed to the command of the army of Flanders, and he defeated the allies at Philippeville and Maubeuge. He was however hated by the Jacobins at Paris, and mistrusted by the court. On the 16th of June, 1792, he wrote a strong letter to the Legislative Assembly, denouncing the plots of those men 'who, under the mask of democratic zeal, smothered liberty under the excess of their license.' He soon after repaired to Paris, and demanded of the Legislative Assembly the punishment of the outrages committed against the king at the Tuileries on the 20th of June. But the republican party was already preponderating in that Assembly, and La Fayette found that he was not safe in Paris. It is said that he then proposed to the king and the royal family to take shelter in his camp at Compiègne, but the advice was rejected by Louis, or rather by those around him, who placed all their confidence in the duke of Brunswick and the Prussians.

On the 30th of June the Jacobins of Paris burnt La Fayette in effigy in the Palais Royal. La Fayette having returned to his camp, publicly expressed to his officers his disapprobation of the attack on the Tuileries of the 10th of August, and on the 15th of that month he arrested the commissioners sent by the Legislative Assembly to watch him. Upon this he was outlawed, and was obliged to cross the frontiers with a few friends. His intention was to repair to some neutral country, but he was arrested by the Austrians, and carried to the fortress of Olmutz, in Moravia, where his wife and daughter soon after joined him, to console him in his confinement. He remained in prison for five years, and was released at last by the treaty of Campo-Formio; but not approving of the arbitrary conduct of the Directory he repaired to Hamburg, and did not return to France till after the 19th Brumaire, 1799. Here he found himself again in opposition to Bonaparte's ambition, and he voted against the consulship for life, refused all employment under that chief, and retired to the country, where he applied himself to agricultural pursuits.

In 1815 he was returned to the house of representatives convoked by Napoleon on his return from Elba. After the defeat at Waterloo he spoke strongly against any attempt to establish a dictatorship, and moved that the house should declare its sittings permanent, and that any attempt to dissolve it should be considered as treason When Lucien appealed to the Assembly not to forsake his brother in his adversity, La Fayette replied with great animation:—'We have followed your brother through the burning sands of Syria, as well as to the frozen deserts of Russia; the bleached bones of two millions of Frenchmen scattered all over the globe attest our devotion to him; but that devotion,' he added, 'is now exhausted, as his cause is no longer the cause of the nation.

After the forced dissolution of the Legislative Assembly by the allied troops, La Fayette protested against that violence, and retired to his country residence at Lagrange. In 1818 he was returned after a great struggle to the Chamber of Deputies for the department of La Sarthe. During that and the following session he spoke in favour of constitutional liberty and against exceptional laws, but to no effect.

In 1824 he went on a visit to the United States, where he was received with the greatest enthusiasm in every state of the Union. In 1830, being in the house of deputies, he was foremost among the members who resisted the arbitrary ordonnances of Charles X. He then called out again the national guards and placed himself at their head. Faithful to his old constitutional principles, he proposed Louis Philippe as king of the French, stating his conviction that a monarchy based on popular institutions was the government best suited to France. During the trials of the ex-ministers he exerted himself zealously to save them from popular fury. Of the subsequent differences between him and Louis Philippe concerning views of foreign and domestic policy several versions have been given. La Fayette died at Paris on the 20th of May, 1834, and his funeral took place on the 28th of the same month, being attended by numerous friends, foreigners as well as French, peers and deputies, who showed the high sense which they entertained of the personal character of the deceased. He was interred, according to his own directions, in the same grave with his wife. He was one of the few public men whose character passed unscathed through the ordeal of half a century of revolutions. (Cloquet, *Souvenirs de la Vie Privée du Général La Fayette*, 8vo., 1836; Sarrans le Jeune, *La Fayette et la Révolution de* 1830, and a *critical notice* of the latter work in the *Foreign Quarterly Review*, No. XX., October, 1832; and the historians and biographers of the French Revolution.)

FAYETTEVILLE. [CAROLINA, NORTH.]

FAYOUM. [FAIOUM.]

FEALTY. [DISTRESS, p. 29; FEUDAL SYSTEM.]

FEAR is the dread or apprehension of any object or event, which object or event however is sometimes purely imaginary. Absence of fear is resolution or courage. Absence of all *dread* would be a repose of the soul, for which, as it cannot exist, the language affords no term. Dread is a minor species of affright or terror, but of a more enduring nature. The highest and most excessive state of terror amounts to a total deprivation of consciousness, and produces death. If these definitions are correct, a smaller degree of terror would consist in a quickly-passing unconsciousness. Dread would consequently consist of a succession of recurring periods of unconsciousness, alternating with excessive rapidity with intervals of consciousness, of which only the total impression is perceived (as in the vibratory strokes of vibrating bodies in acoustics): this total impression constitutes dread. Fear is only distinguished from dread through the imminence of danger, and thence a fearful or a dreadful or frightful object are nearly synonymous. The longer these periods of unconsciousness endure in a state of fear or dread, the more powerful are the feelings, till at length (as in drowning persons, or in children who are much alarmed) total unconsciousness ensues, and, according to circumstances, death.

If these definitions of fear and dread are psychologically correct, they serve to explain all the consequent physiological phenomena. A violent blow upon the head deprives us of consciousness, by occasioning an interruption in the regular functions of the brain, through which recollection ceases, and unconsciousness ensues. Any horrible appearance to or impression upon the organs of sight may produce a similar effect; for if the nerves of vision are so powerfully affected as to re-act upon the brain, the regularity of its action is similarly destroyed and the same effects are produced as by a blow. It is the same with all the other senses; and it is worthy of remark, that these feelings (of fear or dread) evidently heighten the powers of the imagination. If therefore a powerful affection of the

visual nerve will produce absolute terror, so may a smaller degree of terror produce the more lasting sensations of dread or fear, *i. e.*, interchanging pauses of consciousness and unconsciousness. With the brain and spinal marrow the nerves are connected which lead to the lungs, to the stomach, to the muscles, and other parts of the body. It is therefore not surprising that dread or fear should display itself in shortness of breath, irregularity of pulsation, an increased action of the heart, a disordered stomach, sickness, and powerlessness of the limbs.

Fear may be also produced through a disordered action occasioned by some local affection of the heart or the lungs, or through plethora or disorders of the blood, or through a general sickness, as in the cholera.

FEAR, CAPE. [Carolina, North.]

FEAR, CAPE, RIVER. [Carolina, North.]

FEAST or **FESTIVAL**, an anniversary day of civil or religious joy: from the Latin *festum.*

Among the Jews, the feast of Trumpets, that of Expiation, the feast of Tabernacles, the feast of Dedication, the Passover, Pentecost, and the feast of Purification, were the principal. The modern Jews have a few more, but they are of later institution.

The Greeks, and more especially the Athenians, had an abundance of festivals. Such were the Aglauria, in honor of Aglauros, the daughter of Cecrops; the Artemisia in honor of Diana; the Dionysia in honor of Bacchus; the Eleusinia in honor of Ceres; and the Panathenæa in honor of Minerva.

The Roman festivals were of two kinds; first, those which were fixed or stated; secondly, those which were appointed annually on a certain day by the magistrates or priests. Of the former kind were the Agonalia, the Faunalia, Matronalia, Cerealia, Saturnalia, &c., through the several months; the latter were the Feriæ Latinæ or Latin holidays, the Paganalia in honour of the tutelary gods of the rustics, the Sementivæ in seed-time, and the Compitalia. Dion (ix. 17) observes that so large a portion of the year was taken up with sacrifices and holidays, to the great loss of the public, that Claudius abridged the number.

The Mohammedans, in addition to their weekly feast, or sabbath, which is observed on Friday, have two festivals of a more solemn kind; the feast of Victims, celebrated on the 10th day of the last month of their year, and the feast of Bairam.

With us, some of our festivals are immoveable, and others moveable. The immoveable festivals are Christmas Day, the Circumcision, the Epiphany, Candlemas or the Purification, the Annunciation of the Virgin Mary or Lady Day, All Saints, and All Souls. The greater part of what are called Saints' Days have long ceased to be celebrated, except in the Calendar. The principal of the moveable feasts, and that by which the rest are guided, and from which they keep their proper distance, is Easter; the others are Palm Sunday, Good Friday, Ash Wednesday, Sexagesima, Ascension Day, Pentecost, and Trinity Sunday. The four feasts from which leases are usually dated, and quarterly payments made, are Lady Day, 25th March; the Nativity of St. John Baptist, June 24th; Michaelmas Day, September 29th; and Christmas Day, December 25th.

The reader who would know more of the English festivals at an earlier period, may consult the *Liber Festivalis* printed at Westminster by W. Caxton, sm. fol., 1483, which consists chiefly of a collection of Sermons, preached to the common people upon them. See also *Festa Anglo-Romana*, 12mo., London, 1678; and *Historia Sacra, or the Holy History, giving an exact and comprehensive account of all the Feasts and Fasts of the Church of England*, 2nd edit., 8vo., Lond.

FEBRUARY, the second month of the year. Its name is derived from *februo*, to purify or cleanse. The Lupercalia were celebrated in this month. (Ovid, *Fasti*, ii. l. 19, 31.) The Saxons called it *Sol-Monath*, because the sun's meridian altitude visibly increases in it.

February was not in the Calendar of Romulus. It was added to the year by Numa, who gave it the twelfth place in the Calendar. The Decemviri transferred it to the place in which it now stands. (Ovid, *Fasti*, ii. l. 47.) Numa assigned twenty-eight days to it in order that the sum of the year might be an uneven number, according to a Pythagorean fancy. (Macrob. *Saturnal.* li. i. c. 13.) In an ordinary year February has twenty-eight days; in bissextile, or leap-year, it has a twenty-ninth, or intercalary day. [Bissextile.]

FE'CAMP, a town in France, in the arrondissement of Hâvre, at the outfal of a small river on the coast of the department of Seine Inférieure, 116 miles north-west of Paris, and 40 from Rouen, the capital of the department. Fécamp is said to have existed in the Roman times as a place for collecting tribute, and to have been thence termed Fisci Campus, whence its modern name. But it owes its historical celebrity to an abbey for nuns founded A.D. 664, or thereabout, by Waning, count or governor of the Pays de Caux. The Normans under Hastings, A.D. 841, dispersed the nuns and levelled the abbey with the ground. The abbey church was rebuilt A.D. 988, by Richard I., duke of Normandie. The abbot of Fécamp subsequently became one of the most powerful ecclesiastics of Normandie; three suffragan abbots owned his superiority; he presented to one hundred and thirty benefices, and his abbey had the enormous yearly income for that period, of 40,000 crowns. There was a noble conventual library well stored with MSS., and containing among its archives many deeds and charters of William the Conqueror and his successors. Casimir, king of Poland, upon the voluntary abdication of his throne, retired to this abbey. Fécamp was also the occasional residence of the dukes of Normandie.

Mr. Dawson Turner, who visited Fécamp in the year 1818, thus describes it:—'Fécamp, like other towns in the neighbourhood, is imbedded in a deep valley, and the road, on approaching it, threads through an opening between hills "stern and wild," a tract of "brown heath and shaggy wood," resembling many parts of Scotland. The town is long and straggling, the streets steep and crooked; its inhabitants, according to the official account of the population of France, amount to 7000, and the number of its houses is estimated at 1300, besides above a third of that quantity which are deserted, and more or less in ruins.' The population in 1832 was 8869 for the town, or 9123 for the whole commune. The church of the abbey mentioned above is yet standing; it is 370 feet long, and 70 feet high; the transept, including 'the Chapel of the Precious Blood,' is 120 feet long, and the tower 200 feet high. Some circular chapels round the choir are probably parts of the church as rebuilt by duke Richard near the close of the tenth century, but the rest of the building is all in the pointed style, and scarcely any part is earlier than the end of the twelfth century; the cloister is modern. The church of St. Etienne, one of the ten parochial churches which Fécamp had before the Revolution, has a very imposing exterior.

The inhabitants are engaged in fishing, manufactures, and commerce; a few years since (Dupin, *Forces Productives de la France*, 1827) they had eighteen vessels engaged in the cod and whale fishery, and one hundred and forty-eight in the mackerel, herring, and other smaller fisheries. The decline of this branch of industry has led many of the fishermen to engage in manufactures. The manufactures are of cotton goods, in spinning, weaving, and dyeing, in which near 1400 workmen are occupied; also linens, leather, articles of clothing for the colonies, iron wares, kelp, rape-oil, and refined sugar. The trade is chiefly coasting-trade, or the supply of the English smugglers with tea, brandy, hollands geneva, and other contraband articles. The port, which is formed by the mouth of the small river which falls into the sea at Fécamp, has been much improved. Courses of instruction are given on navigation, geometry, and mechanics applied to the arts; there are a tribunal de commerce, or commercial court, an exchange, and an hospital. Limestone is quarried, and chalk refined in the neighbourhood.

FECIA'LES, in antient Rome, were the messengers or heralds of war and peace; they belonged to the order of the priesthood, and their persons were held sacred even by enemies. When the Romans had or pretended to have grievances against another state, they sent one of the feciales, who, clad in his solemn robes, entered the obnoxious territory or town, and in the presence of the assembled people, or of the magistrates and rulers of the country, stated the complaints of the Romans, and asked for reparation. A certain time, generally thirty days, was allowed for deliberation and for returning an answer, at the end of which the fecial herald came again, and if the answer was not satisfactory, he took to witness Jupiter and the other gods that he had religiously performed his duty, and that it was now the

business of the Roman senate and people to decide upon the question. On his return to Rome he declared to the senate the result of his mission, and told them that they might now declare war if they thought proper. If war was decided upon, the fecial herald went again to the limits of the hostile state, and there, in presence of witnesses, appealing to Jupiter and the other gods celestial and terrestrial, he protested against the injustice of that people and their obstinacy in refusing reparation, and declared that nothing now remained for Rome but to seek satisfaction by its own arms: he then threw a spear within the hostile boundaries, upon which war was considered as begun. When a treaty of peace or alliance was to be concluded, the presence of the feciales was likewise required, as with the Romans all political conventions partook of a religious character. The Etruscans and other antient Italian nations had also their feciales. This institution had a beneficial effect, insomuch as it tended to humanize the system of warfare, and to prevent sudden and unexpected aggressions. (Pitiscus, Hildebrandus, and the other writers on Roman antiquities.)

FE'CULA, or FÆCULA. [STARCH.]

FECUNDATION OF PLANTS. [IMPREGNATION OF PLANTS.]

FEDERATION. A federal union of sovereign states may be most easily conceived in the following manner:—

We will suppose that the sovereign power in any number of independent states is vested in some individual in those several states. These sovereign persons may agree respectively with each other and with all not to exercise certain functions of sovereignty in their several states, and to transfer these functions to be jointly exercised by the contracting sovereign persons. The consequence of such a compact will be that the contracting sovereign persons in their joint capacity will become sovereign in each state and in all the states. The several sovereign persons having for the time surrendered to the joint body certain powers incident to their several sovereignties are no longer severally sovereign in their several states. The powers surrendered to the joint body may be determined by written contract, the interpretation of which belongs to the joint body, yet in such a manner that there can be no valid interpretation unless the sovereign persons are unanimous; for if any number or majority could bind the rest, they might, by interpretation, deprive the several contracting persons of all the powers reserved to them by the contract. It follows also from the terms of the union, that any one party can withdraw from it at pleasure, and, as far as he is concerned, dissolve the union; for the essence of this union is the continuing consent of all.

This is the simplest possible form of a supreme federal government; one in which the contracting sovereign powers are individuals, and in which the sovereign persons in their aggregate capacity exercise the functions of sovereignty. Such a federation may never have existed, but any federation that does exist or can exist, however complicated it may seem, is reducible to these simple elements.

If the sovereign powers, instead of being in individuals, are in all the people of the respective states, the only difference will be that the functions of sovereignty, which in the first case we supposed to be exercised by the individual sovereigns in their joint capacity, must, in this case, be delegated to individual members of the sovereign body. The citizens of the several sovereign states must in the first instance of necessity delegate to some of their own body the proper authority for making the federal contract or constitution; and they must afterwards appoint persons out of their own body, in the mode prescribed by the federal contract, for executing the powers intrusted by the federal contract to persons so appointed. Thus the individuals who form the federal contract act therein severally as the agents of the sovereign states from which they receive their commission; and the individuals appointed to carry into effect the terms of the federal contract are the ministers and agents of that sovereign power which is composed of the several sovereign states, which again are composed of all the citizens. By whatever name of President, Senate, House of Representatives, or other name, the agents of the sovereign power are denominated, they are only the agents of those in whom the sovereign power resides.

When the sovereign power is so distributed, the question as to the interpretation of the federal contract may in practice be more difficult, but in principle it is the same. No one state can be bound by the interpretation of the rest, for if this were once allowed there would be no assignable limit to the encroachments of the states exercising sovereign power in their aggregate capacity. It is a clear consequence of the nature of the compact, whether the several sovereign powers are nations or individuals, that each contracting power must exercise its judgment on the interpretation of the instrument to which it is a party, and that no interpretation from which any power dissents can, consistently with the nature of the compact, bind that power.

In the case of complete dissent or disagreement by any one power, the contract is, by the very nature of its terms, at an end; for the contract being among sovereign powers, they cannot severally as such yield *obedience* to another sovereignty, which results from the aggregation of their several sovereign powers: their acts in their joint capacity must be acts of complete consent.

If the sovereign power in such a federal union has delegated the power of interpreting the written instrument of union to certain judiciary authorities, appointed under the federal compact for the purpose of carrying its provisions into effect, the several sovereign powers must still exercise, either by their legislatures or their judiciary authorities, their right to judge of the correctness of the interpretation, just as much as if the several sovereign persons, in the case first supposed, themselves exercised the functions of sovereignty in the supreme federal government.

What is commonly called the general government of the United States of North America is an example of a federation or federal government, or a supreme federal government. The contracting parties were sovereign states (the sovereignty in each state being in the citizens), which in their aggregate capacity formed a supreme federal government. The ministers for carrying into effect the federal government are the president and congress, and the judiciary of the United States. By the preamble to the constitution it is in fact declared that the 'people of the United States' are the contracting parties.

The fifth article of the constitution provides that 'The congress, whenever two-thirds of both houses shall deem it necessary, shall propose amendments to this constitution, or, on the application of the legislatures of two-thirds of the several states, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes, as part of this constitution, when ratified by the legislatures of three-fourths of the several states, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the congress; provided, &c., and that no state, without its consent, shall be deprived of its equal suffrage in the senate.' From this article it is clear that the framers of the constitution did not fully comprehend the nature of the supreme federal government; for it is assumed by this article that the several states may be bound without their unanimous consent, which is contrary to conditions essentially implied by the nature of the union. This article involves also the inconsistency that the sovereign in any state may bind his successors: if the case of a federation of individual sovereign persons had been that to be provided for, the impossibility of the provision would have been apparent; but the impossibility equally exists when the contracting sovereign powers are respectively composed of many individuals, for the abiding consent is still the essence of the union that has been formed.

This is not the proper place to discuss the advantages and disadvantages of a supreme federal government, nor to examine into its stability. That it is necessarily deficient in one element of stability, namely in there being a necessity for all the consenting parties to continue their consent, is evident: in this respect it is like a partnership for an indefinite period, which may at any time be dissolved by any one of the partners. Such a power, which is incident to the nature of the partnership, so far from being an objection to it, is a great advantage. So long as all the parties agree, they have the benefit of the union: when they cannot agree, they take instead of it the benefit of the separation.

It is also foreign from our purpose to consider what is the tendency, in a union like that of the United States, resulting from the powers placed in the hands of the President and Congress by the States acting in their aggregate capacity. If such power were placed in such hands by sovereign persons originally severally sovereign in their respective states, as in the case first supposed, the vigi-

lance of these persons in their aggregate capacity, though somewhat less than the vigilance of a single sovereign person, would probably prevent any undue assumptions of power on the part of those to whom they had delegated certain fixed powers. But the further the several sovereigns, who in their aggregate capacity form this federation, are removed from those to whom they delegate certain powers, and the more numerous are the individuals in whom this aggregate sovereignty resides, the greater are the facilities and means offered to, and consequently the greater is the tendency in, their ministers and agents practically to increase those powers with which they may have been intrusted. In their capacity of ministers and agents, having patronage at their command and the administration of the revenue, such agents may gradually acquire the power of influencing the election of their successors, when their own term of office is expired, and may thus imperceptibly, while in name servants, become in fact masters. That there is such a tendency to degenerate from its primitive form in all social organization, as there is in all organized bodies to be resolved into their elements, seems no sufficient reason for not forming such union and deriving from it all the advantages which under given conditions it may for an indefinite time bestow on all the members of such federation.

Those who wish to examine into the nature of the North American Union and the party questions which have arisen out of the interpretation of the federal constitution may consult the essays of Jay, Hamilton, and Madison in the *Federalist*, the *Journal of the Philadelphia Convention*, published in 1819, and Tucker's *Life of Jefferson* (London, 1836), where they will find ample reference to other authorities.

A supreme federal government, or a composite state, is distinguished by Austin (*Province of Jurisprudence determined*) from a system of confederated states: in the latter 'each of the several societies is an independent political society, and each of their several governments is properly sovereign or supreme.' It is easy to conceive a number of sovereign powers, such as the German States, assembling and passing resolutions which concern all the members of the confederacy, and yet leaving these resolutions to be enforced in each state by its own sovereign power. Such a union therefore differs essentially from a supreme federal government, which enforces its commands in each and all the states. As to the existence of a written constitution, as it is called, in the one case and a mere compact in the other, that makes no essential difference, for the federal constitution, as we have shown, is merely articles of agreement, which only derive their efficacy from the continued assent of all the members that contribute in their aggregate capacity to form the sovereign power in such federation.

As to a system of confederated states, Austin adds: 'I believe that the German Confederation, which has succeeded to the antient empire, is merely a system of confederated states. I believe that the present diet is merely an assembly of ambassadours from several confederated but severally independent governments; that the resolutions of the diet are merely articles of agreement which each of the confederated governments spontaneously adopts; and that they owe their legal effect, in each of the compacted communities, to laws and commands which are fashioned upon them by its own immediate chief. I also believe that the Swiss Confederation was and is of the same nature. If, in the case of the German or of the Swiss Confederation, the body of confederated governments enforces its own resolutions, those confederated governments are one composite state, rather than a system of confederated states. The body of confederated governments is properly sovereign: and to that aggregate and sovereign body each of its constituent members is properly in a state of subjection.'

FEDOR IVANOVICH, the last tzar of Moscow, of the dynasty of Ruric, ascended the throne in 1584, after the death of his father, the celebrated tyrant Ivan Vasilevich. He was weak in body and in mind, but the affairs of the government were conducted by the talented Godoonoff during his reign, which was marked by some events that produced a decisive influence on the destinies of the Russian empire. It was during Fedor's reign that the peasants of Muscovy, who had hitherto enjoyed personal liberty, and could pass from the estate of one landowner to that of any other who would grant them better conditions, were converted into serfs attached to the ground (servi glebæ adscripti). This change was introduced in 1592 by the instrumentality of Godoonoff, who adopted that measure in order to gain a party among the landowners. There had been previously to that epoch domestic slaves in Russia, but the predial serfs date only from that time. The Greek church of Moscow originally depended on the patriarch of Constantinople, who consecrated the Metropolitan of Moscow; but after the capture of Constantinople by the Turks, the supremacy of the Greek patriarch over the Muscovite church was almost destroyed. Jeremy, patriarch of Constantinople, arriving in 1588 at Moscow in order to collect alms for the erection of churches, was received with great honours by Fedor, who, being exceedingly devout, presented the head of the Greek church with rich donations. Jeremy acknowledged the kindness of Fedor by consecrating a patriarch of Moscow, which dignity lasted till the time of Peter the Great, who abolished it, and declared himself the head of the Russian church. The conquest of Siberia, which had been commenced under Ivan Vasilevich, was completed under Fedor, during whose reign Russia made the first attempt to extend its influence over the Caucasian regions. The khan of Crimea invaded Russia, and penetrated to the capital, but he was repulsed from the walls of Moscow in 1591. The reign of Fedor is also remarkable for many diplomatical relations with foreign courts, and particularly with that of England. The most important event of Fedor's reign was his attempt to get himself elected king of Poland in 1587. Fedor, or rather his prime minister Godoonoff, promised to the states of Poland and Lithuania, that if they elected him king, he would unite all the forces of Moscow with those of Poland, and conquer the Crimea for Moscow, and Wallachia, Moldavia, and Hungary for Poland. The proposed union would have easily created a power capable of accomplishing not only the projected but even much more extensive conquests. Fedor's proposals were readily accepted by the majority of the Lithuanians, and they found many partisans even amongst the Poles. He was on the point of being elected, when, fortunately for the repose of Europe, the overbearing conduct of the Muscovite ambassadors destroyed the hopes of Fedor, and Sigismund Vasa, prince of Sweden, was elected king of Poland. Fedor died in 1591, and with him ended the dynasty of Ruric on the throne of Moscow, his younger brother Demetrius having been murdered through the instrumentality of Godoonoff.

FEDOR ALEXEYEWICH, tzar of Moscow, the eldest brother of Peter the Great, ascended the throne after the death of his father Alexius Michaylowich, 1676, being only 19 years of age. His youth and delicate constitution did not prevent him from displaying remarkable talents and energy, and the strong will which he constantly evinced to improve the barbarous institutions of his country, and to introduce civilization into the Muscovite empire, may justify us in supposing that but for his death he might have accomplished what was afterwards performed by his brother Peter the Great. Fedor distinguished his reign particularly by putting an end to a most absurd custom which had acquired the force of law in Muscovy. According to this custom, called Mestnichestvo (literally *placeship*, from Mesto, place), no member of a great family could be put under the command of or give precedence to a person whose birth was considered inferior to his. All the noble families of the country were registered in a roll called *Razriad*, or *Arrangement*, and all the disputes which frequently arose about precedence, not only at the court, but even in active service, were settled by referring to this kind of herald's office. A natural consequence of such a preposterous system was confusion, and it frequently proved very detrimental to the public service; but it was so deeply rooted, that even the celebrated tyrant Ivan Vasilevich, who deluged Muscovy with blood and decimated its nobility, was unable to destroy the Mestnichestvo. Fedor abolished the absurd practice by very simple means: he assembled his boyards, or principal nobles, and having expostulated with them on the bad consequences of the above-mentioned custom, threw, in the presence of the assembly, all the rolls of the Razriad into the fire. This auto-da fé, which took place in 1681, extinguished for ever the system of the Mestnichestvo, and since that time the nobles of Russia have equal privileges. The nobility in Russia enjoy as a class many rights from which the other classes of the community are excluded, but neither antient family nor title legally gives in Russia any privilege to an individual belonging to the class of the nobles which any other mem-

ber of the same body does not possess. The genealogical records of the Muscovite nobles, which did not relate to their claims of precedence, were spared by Fedor, and even arranged in order by his command. Death prevented Fedor from attempting other reforms in his country; he died in 1682, at the age of 25.

FEE SIMPLE. [ESTATE.]

FEE TAIL. [ESTATE.]

FEELING. [TOUCH.]

FEES, certain sums of money claimed as their perquisite by official persons under the authority of various acts of parliament, and by prescription. The right to fees, as well as the amount payable in most cases connected with the administration of justice, has been regulated by several recent statutes.

Officers demanding improper fees are guilty of extortion. [EXTORTION.]

The rewards paid to barristers and physicians, attorneys and surgeons, for their several services, are called fees, which may be recovered by the two last-named by action; but barristers and physicians cannot recover their fees by any legal proceeding, on the ground that they are not capable of being fairly estimated in amount, and also because they are or ought to be paid in advance. [See COUNSEL; PHYSICIAN.]

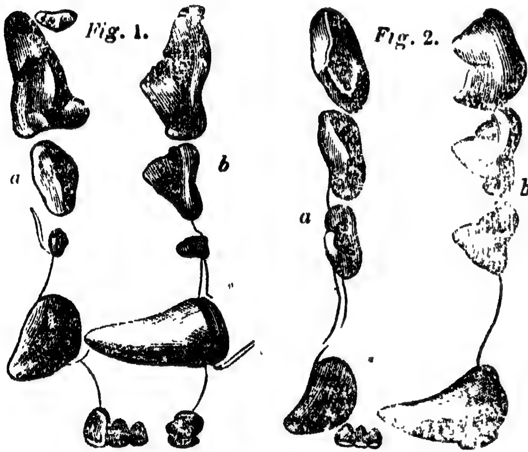
FEHME, or FEHMGERICHT. After the crusades, when the spirit of chivalry had degenerated from its antient splendour, the German nobles retired to their gloomy castles, whence they darted, like birds of prey, upon the travelling merchants, or waylaid each other for the perpetration of every description of outrage. Murder, robbery, rape, abduction, went unpunished. Nor were these excesses confined to the laymen; the clergy, secular and monastic, casting off the rigid morals of their predecessors, plunged into license and debauchery. In the midst of general depravity and anarchy, the authority of the laws, both civil and ecclesiastical, gave way to force, which, in the hands of ignorance and rapacity, threatened society with dissolution. In order to check the audacity of those who, relying upon their power, thought themselves above the reach of the law, and for the protection of the defenceless and innocent, a secret tribunal was formed, called the sacred Fehme, or Fehmgericht. According to the best critical inquiries, there can be little doubt that the formation of this tribunal was due to Charlemagne after his conquest of Saxony. A division into counties, 'grafschaften,' formed part of the general organization which he then gave to Germany; each county had a 'freygraf,' free-count, and a 'schœffe,' sheriff, who, on certain days of the month, generally on Tuesdays, held a court for the administration of justice in the open air. According to the antient German custom, the spirit of which still breathes in the laws of England, no criminal proceedings could be had by a judge unless an information was previously lodged by the prosecutor. 'Wo kein klager ist, da ist kein richter;' 'where there is no accuser, there is no judge,' was a maxim of the old Saxon law. Charlemagne, having conquered the Saxons, endeavoured to establish Christianity by force, and punished all who would not profess the new religion; but being aware that no Saxon would betray his fellow-citizen for such an act of disobedience, he imposed on the sheriffs the duty of accusing and denouncing all those who would not profess Christianity. This obligation was afterwards extended to other crimes, as adultery, rape, administering of poison, conspiracy, and rebellion.

At the period of anarchy above alluded to, the schœffen, who were the traditional possessors of the secret orders of Charlemagne, being prevented by continual acts of violence from discharging their duties, resolved on forming a secret association for the vigorous enforcement of the laws.

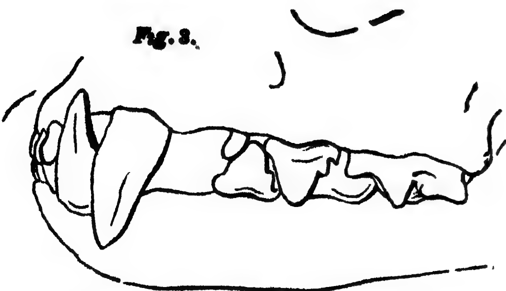
The members of this tribunal, who called themselves Wissende, 'the Knowing Ones,' were chosen from the most moral, well-educated, and boldest members of the community. After the necessary inquiries into his previous course of life, the neophyte was summoned to attend a meeting of the schœffen, which was held at midnight in some secluded part of a forest, and opened with all the formalities of a court of law. He was required to kneel before the freygraf, his head uncovered, with his fore-finger on the sword, and to take the following oath:—'I swear to keep the secret from man and woman, from village and farm, from stick and stone, even from toad and frogs, or any other of God's creations, unless I have the permission of him who heads the holy Fehm. And I will not break my oaths for pleasure or pain, for pledge or dress, for silver or gold, or any other reason. I further swear to disclose to this holy chair, which presides at our sittings, every thing that concerns this secret tribunal, which I know to be true, or hear for truth from trustworthy persons.' As soon as the neophyte had pronounced this oath, he was informed that the object of the association was to uphold peace, virtue, and honour against the open or concealed enemies of the law; and as the interest of the order required that the schœffen of the different counties and principalities should be known to each other, they had adopted a sign consisting of four letters, S. S. G. G., the signification of which is still involved in mystery. The neophyte was further presented with a rope, which he was obliged to carry in his left sleeve, and also a dagger, on which the four above-mentioned letters were engraved, together with other symbols. Moreover he was charged with the duty of accusing before the secret tribunal all those who could not be successfully prosecuted before the ordinary courts, and of executing capital punishment whenever required by the society to perform this duty.

The mode of proceeding against the accused was as follows: If the author of a crime absconded, or his residence was unknown, the schœffe was required to write four summons, and post them on a cross road; but if the residence was known, the schœffe came at night, and nailed the summons with four nails, folded as a letter, containing an imperial farthing, on the man's door. He then rang the bell, and told the porter that he had brought a letter from the sacred tribunal for his master. The summons required the accused to appear at a certain hour at the appointed spot, within a fortnight after its delivery, to answer for his base and criminal conduct before the sacred tribunal, or otherwise clear himself of the accusation; at the same time threatening to proceed against him for contempt in case of non-appearance. If the accused attended the summons, the schœffe who brought the accusation was called upon by the freygraf to state all that he and his witnesses knew relating to the charge, after which the accused and his witnesses were heard. The judges were all armed and dressed in black gowns, with a cowl that covered their faces like a mask. When the sentence was pronounced, the execution of which, in case of capital punishment, was intrusted to all the members of the order, the condemned (who came under a kind of safe conduct) was dismissed, with the warning that his life was forfeited, and that no power on earth could withdraw him from the deserved punishment. Whenever three sheriffs (for that was the number necessary for an ordinary execution) afterwards met the person condemned, they seized him, and with one of the ropes which they carried in their sleeves, hung him on the next tree, fixing a dagger in the trunk to denote that the deceased was killed by the holy tribunal. When such an event occurred, no court of law dared to take notice of the affair; every man's tongue was struck silent, for fear of incurring the vengeance of this terrible body. This punishment however was seldom inflicted upon those who readily appeared; in such cases the judges were satisfied with causing the defender to redress the wrong that he had inflicted. But if the accused failed to attend the summons, which was repeated three times, judgment passed by default, and the accused was declared an outlaw. Every sheriff, though he were the father or son of the criminal, was duty-bound to put him to death by the rope, the dagger, the sword, or even poison, and to revenge any insult offered to the tribunal upon man, woman, or child, noble or plebeian, free-born or slave, house or farm, monastery or nunnery, that dared to shelter him.

The power of this tribunal was greater than that of the Holy Inquisition; it struck terror into all Germany, and especially in Westphalia, where it originated. Princes and nobles were anxious to enter into this order either for protection against their enemies, or to avoid the jurisdiction of a tribunal the power of which they were unable to withstand. Towards the end of the fifteenth century, the German empire having acquired more political consistency, and the objects for which this tribunal was instituted having ceased to exist, it gradually lost its power, without being abolished by any legislative enactment. Some traces of the revival of this tribunal appear in the seventeenth century, but its efforts to regain its former importance were checked by the public authorities. It sunk at length into utter in-



significance; and a remnant of it which continued to act as a kind of society for the suppression of vice was abolished in Westphalia by order of Jerome Buonaparte in the year 1811. The members of the order maintained that they were the true and genuine possessors of the secrets intrusted to the Fehm by Charlemagne, but no one would or could explain the signification of the mystical S. S. G. G. Goethe has given the most graphic picture of the working of this tribunal in his historical drama 'Goetz von Berlichingen.' The best historical account of its organization is by Paul Wigaud, 'Die Fehmgerichte Westphalens,' Hamm., 1827.

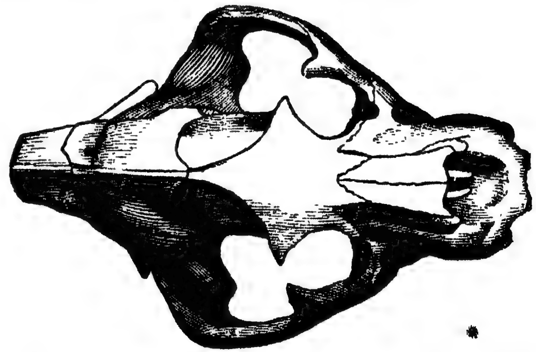


FELEGYHA'ZA, a market town, and the capital of the Hungarian district of Little Cumania, situated on the high road between Pesth and Temeswar, in the middle of a country of corn-fields, vineyards, and orchards; in 46° 43′ N. lat., and 19° 52′ E. long. It contains about 1370 houses, and a population of about 15,030. There is a Roman Catholic church, a gymnasium, and a very handsome building in which the Cumanian courts of justice are held and the public archives kept. Roman urns have been found in the vicinity of the town. The cattle-markets held here are considerable.

FELIPE, SAN, a town in South America, in the republic of Venezuela, and the department of Sulia, in 10° 30′ N. lat., and 68° 30′ W. long., in a pleasant valley on the small river Aroa. In the surrounding country, which is diversified by high hills and wide fertile valleys, great quantities of cocoa, coffee, maize, and rice are grown, also a little cotton. These commodities are sent to Puerto Cabello to be exported. The town, which has a population of about 7000 souls, has several handsome houses, and its streets are regularly laid out. Some copper-mines are worked in the neighbourhood.

FELIS, FE'LIDÆ, animals of the cat kind, a family of *Carnivora*, in which the organs of destruction reach their highest development. They are, among the quadrupeds, what the *Falconidæ* are among the *Birds*.

The principal instruments of the destructive energy of these animals are the teeth and claws.



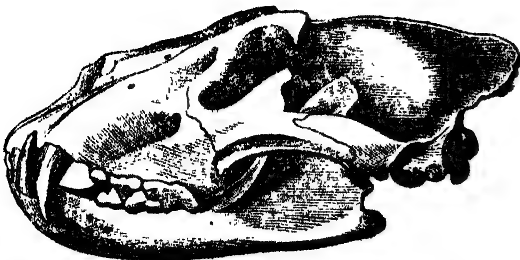
Teeth of the cat family. 1, Upper jaw; *a*, internal view; *b*, external view; 2, lower jaw; *a*, internal view; *b*, external view; 3, teeth when the jaws are shut seen in profile: from F. Cuvier.

The dental formula then in these animals is the following:—Incisors, $\frac{6}{6}$, canines, $\frac{1-1}{1-1}$, molars $\frac{4-4}{3-3} = 30$.

The formation of these teeth is beautifully shown in four preparations in the museum of the Royal College of Surgeons in London. No. 329 is the anterior part of the right *ramus* of the lower jaw of a young lion, exhibiting the teeth, together with the gums in which they are imbedded, and the border of soft parts, or lip, with which they are surrounded. No. 330 is the anterior part of the upper jaw of a young lion injected, in which the body of the second or permanent laniary (canine tooth, or *cuspidatus*) is pretty completely formed, and the fang forming. The laniary is cut down in the direction of its axis to expose the cavity containing the pulp on which it was forming. There is one of the molars in the act of being shed, and the adult or permanent tooth is pushing into the gum. No. 331 is the counterpart, or opposite section of the same laniary; and No. 332 is the laniary of the jaw of the opposite side of the same lion, showing the whole of the pulp on which it was forming. (*Catalogue, Physiological Series, Gallery*, vol. i. p. 95.)

The articulation of the condyles of the lower jaw in which this formidable apparatus is set is so contrived as to cause its operation in the most efficient manner. These processes are situated in the same straight horizontal line; they are cylindrical and firmly locked in the transversely elongated glenoïd cavities, the margins of which are so extended both before and behind the condyle that rotatory motion is impossible. The crowns of the molar or rather lacerating teeth are compressed and covered with enamel, as indeed are those of all the others: the molars terminate in pointed processes, and the lower teeth shut within the upper. Thus, when called into action, the teeth and jaws operate like the antagonist blades of a pair of scissors upon the substance submitted to their cutting edges. The canine teeth, the principal prehensile weapons of the head, are very long and large, especially in the larger cats. If we examine the cranium of a lion or tiger we shall be at no loss to discover the machinery by which this dental apparatus is worked.

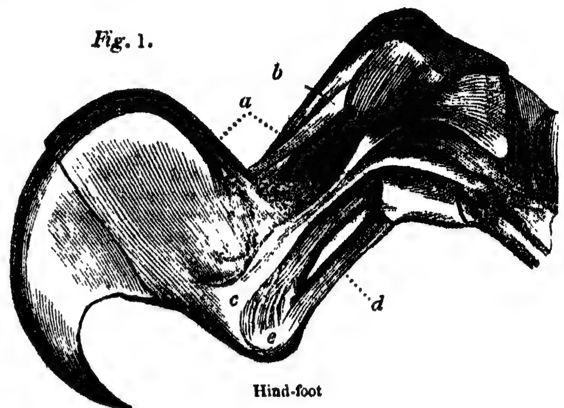
The *crista occipitalis*, which is most strongly marked in the cats, is a sharp and prominent bony ridge rising from the upper and hind portion of the skull. Its chief use is for the attachment of the temporal muscle, and the size of the temporal fossa, and the strength and extent of the zygomatic arch depend upon the magnitude of that muscle. In no animals is this fossa larger than in the carnivora. It not only occupies the whole of the sides and upper part of the skull, but is still further increased by the prominent bony crests proceeding from the frontal, parietal, and occipital bones. The temporal muscles would indeed almost completely cover the cranium in many of these animals, were it not for their separation by the parietal ridge.



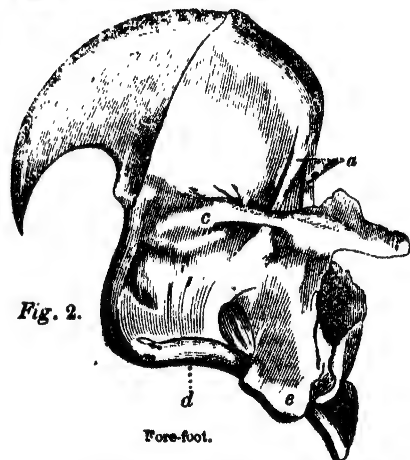
Skull of lion seen from above, showing the extent of the zygomatic arches and temporal fossæ.

The zygomatic suture is so oblique that the temporal bone forms the whole superior margin, and the *os malæ* the inferior edge of the zygoma.

In consequence of the construction which we have endeavoured to explain, the lower jaw is capable of motion only upwards and downwards, and entirely incapable of that motion in a horizontal direction which is necessary to mastication, properly so called. Accordingly the cats cut and lacerate their food coarsely, and transmit it in large portions to the stomach, there to be acted on by the gastric juice.



The muscles of the neck and fore-quarter of the cats are especially powerful to give full effect to this part of the organization, and to enable the animal to drag or carry away its prey.



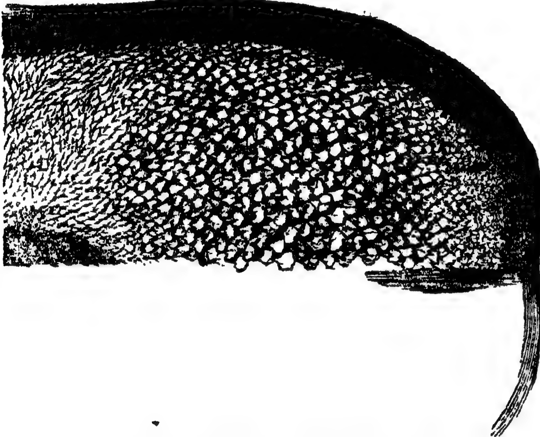
Skull of lion seen in profile, showing the prominent bony crests.

We must next turn our attention to the other organs of prehension, the claws.

The five toes of the anterior, and four toes of the posterior extremities of the cats are armed with very strong, hooked, sub-compressed sharp claws. These extremities, the anterior ones especially, thus become powerful instruments for seizing and rending the prey. The muscles that are to wield these weapons are of great strength: those of the fore arm especially, which in the lion and tiger offer the same arrangement for flexion, extension, pronation, and supination, as is observed in man, are highly developed, and the blow alone which the animal can deal with this limb is frequently fatal. It is asserted that the Bengal tiger has been known to fracture the skull of a man with one stroke of its heavy paw. The claws, by a beautiful conformation, are always preserved without effort from coming in contact with external bodies, so as to keep them sharp and ready for action. There are some interesting specimens in the Museum of the Royal College of Surgeons in London, which will illustrate this provision. No. 287 of the 'Physiological Series' is a toe from the right fore foot of a lion, with the last phalanx retracted on the ulnar (which from the prone state of the foot is the outer) side of the second phalanx. This state of retraction is constantly maintained, except when overcome by an extending force, by means of elastic ligaments, two of which have bristles placed beneath them in the preparation. The principal one arises from the outer side and distal extremity of the second phalanx, and is inserted into the superior angle of the last phalanx; a second arises from the outer side and proximal end of the second phalanx, and passes obliquely to be inserted at the inner side of the base of the last phalanx; a third, which arises from the inner side and proximal extremity of the second phalanx, is inserted at the same point as the preceding. The tendon of the flexor profundus perforans, which is the antagonist of the ligaments, has been divided. No. 287 A is a toe from the left fore foot of a young lioness, with the last phalanx drawn out, as in the action of the flexor profundus. The same ligaments are shown as in the preceding preparation, together with the insertion of the flexor and extensor tendons. In order to produce the full effect of drawing out the claw, a corresponding action of the extensor muscle is necessary to support and fix the second phalanx; by its ultimate insertion in the terminal phalanx, it serves also to restrain and regulate the actions of the flexor muscle. A bristle is placed beneath that part of the extensor tendon which passes under one of the elastic ligaments to be inserted into the base of the last phalanx immediately above the articulation. In both preparations lateral processes of tendon may be observed going to the under part of the base of the phalanx, which are partly inserted there, and partly lost in the integument: they are given off from the extensor tendon as it passes over the proximate phalanx, and are joined by ligamentous fibres from the sides of the same phalanx. No. 288 is a toe from the right hind foot of a lion, with the last phalanx drawn out, and the elastic ligaments put on the stretch. As the phalanges of the hind foot are retracted in a different direction to those of the fore foot, *i. e.* directly upon and not by the side of the second phalanx, the elastic ligaments are differently disposed, as may be seen by comparing this with the preceding preparation. The outer ligament is of a flattened triangular form; it arises from the whole outer side of the middle phalanx, is strongest at the anterior margin, and is inserted at the superior angle of the last phalanx: the inner ligament is of a rounded form, arises from the inner side and distal end of the second phalanx, and is also inserted at the superior angle of the last phalanx, which is necessarily drawn back in the diagonal of the elastic forces. No. 288 A is the innermost toe or pollex of the right fore foot of a young lioness, exhibiting a disposition of the elastic ligaments and mode of retraction similar to the toes of the hind foot; but here the inner ligament is of the flattened triangular form, and the outer one rounded. The latter passes between a division in the extensor tendon, one part of which is inserted in the base of the last phalanx just above the articulation; the other part into the outer side of the base of the phalanx, and into the integument. (*Catalogue, Physiological Series, Gallery*, vol. i., p. 75.) 'It seems scarcely necessary,' adds the able author of the foregoing description, 'to allude to the final intention of these beautiful structures, which are, with some slight modifications, common to the genus *Felis*. The claws being thus retracted within folds of the integument, are preserved constantly sharp, and ready for their destined functions, not being blunted and worn away in the ordinary progressive motions of the animal; while at the same time, as soft parts only are brought in contact with the ground, this circumstance contributes to the noiseless tread of the feline tribe.' (*Ibid.*)

Structure of the apparatus for retracting and extending the claws of the cats, as exemplified in the fore foot and hind foot of the lion.

The elastic ligaments which retain the last phalanx and claw in a state of retraction are not the same in the fore and hind foot.



In figure 1, which is a toe from the left fore foot of a young lion, represented in a state of extension, *a* points to the two elastic ligaments; *b*, the tendon of the extensor muscle; *c*, a process of inelastic tendon; *d*, the tendon of the flexor muscle, which passes over the upper extremity of the last phalanx at *e*, as over a pulley, and thus assists the powerful action of that muscle.

In figure 2, a toe from the hind foot, the two elastic ligaments (*a*) converge to be inserted into the upper angle of the last phalanx, and draw it backwards directly upon, instead of by the side, of the penultimate phalanx: *c* is a process of lateral inelastic tendon; and *d* the tendon of the flexor profundus, which is strongly strapped down by an annular ligament, *e*.

The claw is supported on the last phalanx, which is of a very peculiar form. Its two portions are united to

each other at nearly right angles. The base of the claw is received into a groove in the body of the bone, to prevent its being pushed backwards in the violent action of the paws. The two parts of the bone form a species of hook or crotchet. The superior end of the phalanx in this state of repose is placed almost vertically; while the other extremity lies nearly parallel to the second. The articulation is at the upper end of the vertical portion, and the flexor tendons, passing over the upper part of the bone, are strongly fixed to the other portion. The action of the flexor profundus causes the whole bone to move through 90° round the end of the second phalanx. (Dr. Traill.)

Having laid before the reader the mechanism of the parts more immediately concerned in the capture of the prey and the separation of its flesh, we must notice another organ which in the cats is used for other purposes than those of mere taste and deglutition. The roughness of a domestic cat's tongue is familiar to every one, as well as the action of lions and tigers in licking the bones of their prey in order to detach any remnants of flesh that may be adhering thereto. This is effected by numerous horny papillæ, which are differently arranged in different species, some having them in straight rows, others in alternate lines; but in all the points are directed backwards. In the Museum of the Royal College of Surgeons are preparations well illustrating the structure of the tongue in these animals. No. 1509

Portion of Lion's Tongue, showing the horny papillæ. From the specimen in the College of Surgeons.

exhibits the tongue and larynx of a young lion injected. The tongue is of considerable length, in consequence of the distance at which the larynx and os hyoïdes are placed behind the bony palate. The soft palate is of a proportional extent. All that part of the tongue which corresponds to the soft palate is smooth; as it advances forwards it is covered with large soft papillæ directed backwards; then there are four large fossulate papillæ, anterior to which the simple conical papillæ continue increasing in size to near the tip of the tongue: the strong cuticular spines with which they are armed have been removed, showing the vascular secreting surface beneath. With the larynx there are preserved the thyroid glands and part of the wide trachea. No. 1510 is a portion of the cuticular covering of the smaller posterior conical papillæ, from the preceding tongue. No. 1511 shows a portion of the cuticular covering of the anterior papillæ of the same tongue. At the fore part of the base of each of the larger spines may be observed a group of small gustatory papillæ. No. 1512 is the extremity of the tongue of a lion, with the cuticular covering of the papillæ removed from one side; and No. 1513 is the anterior part of the tongue of a lion, with the cuticular and spiny covering of the papillæ preserved. (*Catalogue, Physiological Series, Gallery*, vol. iii. part i. p. 12.)

Mr. Owen remarks, that in the cats generally the connexion of the *os hyoïdes* to the cranium is not by a long elastic ligament, as in the lion, but by an uninterrupted series of bones, and that this latter structure exists in the *Cheetah* (*Felis jubata*). (*Zool. Proc.* 1833.)

This leads us to the other

Digestive organs.—In the cats the salivary glands are small, as might be expected where it can hardly be said that mastication is exercised. The stomach of the lion is divided, by a slight contraction in its middle, into two portions. Its coats, particularly the muscular coat, are very strong, as in most of the *Carnivora*. Blumenbach observes, that in most carnivorous quadrupeds, particularly those of a rapacious nature, the stomach bears a considerable resemblance on the whole to that of the human subject. Mr. Lawrence, in his notes, remarks, that the food of carnivorous animals, approaching in its constituent elements more nearly to those of the animal than that of the herbivorous tribes, is more easily reduced into the state which is required for the nourishment of the body in the former than in the latter case. In the Carnivora, the stomach, which is of a cylindrical form, has no cul-de-sacs; the œsophagus opens at its anterior extremity, and the intestine commences from the posterior, so that every thing favours a quick passage of the food, which receives no mastication, and is retained a very short time in the stomach. The intestine has no valves, is small in diameter, but muscular, and the whole canal, when compared with the body, is extremely short, being as 3 or 5 to 1. It is worth noticing, that in the domestic cat they are as 5 to 1, but in the wild cat they are only as 3 to 1. Some of the Carnivora have no cæcum, and in those that have this appendage it is constantly small and uniform in its cavity. In the Museum of the College of Surgeons are four preparations, Numbers 693 to 696 (*Gallery*), both inclusive, showing the structure of the intestines of a lion. No. 724 shows the termination of the ileum of a lion, with the cæcum or caput coli injected. The cæcum is simple, resembling that of the Suricate (*Ryzæna tetradactyla* of Illiger), with its apex similarly occupied by a cluster of glands; the terminal orifice of the ileum is also of a circular form, but it is situated on a valvular prominence in the large intestine. No. 730 is the injected colon of a lion. The longitudinal muscular fibres are very strong, and are disposed around the whole circumference of the intestine, which consequently is not drawn up into sacculi. The lining membrane is smooth, and is thrown into zig-zag rugæ. No. 736 is a portion of the rectum of a lioness, showing the strong round fasciculi of longitudinal fibres forming the outer stratum of the muscular coat, part of which has been turned down to show the inner circular fibres. The intestinal glands of the ileum in the lion are shown by No. 757. No. 806 shows the liver of the domestic cat, and its subdivision, as in all carnivorous quadrupeds, into a great number of lobes. The second lobe from the left side, or cystic lobe, is deeply cleft for the insertion of the suspensory ligament; to the right of this cleft it is perforated for the lodgement of the gall-bladder. No. 807 is the cystic lobe of the same species, showing that the gall-bladder is situated in the middle of the substance of the large lobe. (*Catalogue, Gallery, Phys Series*, vol. i.) Blumenbach remarks that the ductus choledochus forms a pouch between the coats of the intestine for receiving the pancreatic duct in the cat. No. 821 in the Museum of the College of Surgeons displays a portion of the duodenum, with the termination of the hepatic and pancreatic ducts of a lion. A black bristle is passed into the ductus communis choledochus, and a white one into the pancreatic duct; the mucus coat of the intestine is laid open to show their junction. The orifice of a distinct pancreatic duct is preserved. No. 837 is the spleen, with a portion of the duodenum and pancreas of a domestic cat. The spleen is of an elongated trihedral form, attached to the stomach by a duplicature of peritoneum inclosing its vessels: this duplicature passes off from the angle formed by the two lesser sides. The splenic vein is seen passing from the spleen along the pancreas, which extends from it to the duodenum. No. 840 exhibits the stomach and duodenum, spleen, pancreas, and great omentum of a small carnivorous animal, apparently of a cat. The parts have been injected, and show remarkably well the principal peculiarities in the form and disposition of these parts as they exist in the feline tribe. A part of the œsophagus has been inverted, to show the transverse rugæ of its lining membrane, near its termination. The stomach exhibits the broad dilated cardiac and the narrow tubular pyloric divisions, which are acutely bent upon each other: in the duodenum may be observed its regular extended curve, and its broad mesentery, by which much greater freedom of motion is allowed to this portion of the intestinal canal than in the human subject. The small omentum is seen attached, not in a regular line along the lesser arch of the stomach, but advancing in an irregular scolloped manner upon its anterior surface: an analogous process of peritoneum is attached

posterior to the lesser curvature The great omentum anteriorly is continued from the greater arch of the stomach, from the left end of which it is continued down the spleen, and posteriorly along the pancreas, which is thus seen to have an entire investment of peritoneum: from the pancreas it extends to the pylorus, where it becomes continuous with the anterior layer, completing the circle, and leaving a large aperture behind the lesser arch of the stomach, which leads into the omental cavity analogous to the foramen Winslowi. The form of the pancreas and its division into the transverse or greater lobe and the circular or duodenal lobe are well shown, and also the form and situation of the spleen. (*Catalogue, Gall., Phys. Series*, vol. i.)

Organ of the Voice.—The terrific roar with which the larger animals of this family rush on their prey is well known, and well calculated to paralyze the nervous system of the victim with fear. Stealing on the victim with noiseless tread till couched within the proper distance for their spring, these destroyers leap on it with a horrid sound which salutes its ear in the same moment almost that it feels the blow of the deadly talons and the murderous gripe of the teeth. The cartilages of the larynx of a lion, the large size of the vocal organ, and the rounded contour of the epiglottis, may be seen in preparation No. 1172 (*Gallery*) of the Museum of the Royal College of Surgeons. From the narrowness of the thyroïd cartilage anteriorly, there is a considerable interval at that part between the thyroïd and cricoïd cartilages, a structure which, as the Catalogue tells us, obtains in all the feline animals. No. 1129 consists of the heart and lungs of a kitten, and shows principally the subdivision of the lungs into many lobes, and more especially the small azygos lobe of the right lung, filling up the space which intervenes between the heart and diaphragm in this and most other quadrupeds. Vicq-D'Azyr and Blumenbach notice the two delicate membranes lying under the ligamenta glottidis of the cat, which probably cause the purring noise peculiar to it.

Urinary and Genital Organs.—'The structure of the kidney in *Mammalia*,' observes Mr. Lawrence, in his notes to Blumenbach's 'Comparative Anatomy,' 'displays two very opposite varieties, which may be called the *simple* and the *conglomerated* kidneys. In the former there is a single papilla, which is surrounded by an exterior crust of the cortical substance. This is the case in all the *feræ*, and in some other animals, as many *rodentia*.' 'In some animals,' says John Hunter, 'the kidney is a very oblong body, extending in length for a considerable way, and very narrow, as in some fish, while in other animals it is almost globular, as in the leopard. * * * In the lion kind, cat kind, as also in the hyæna, we find that perhaps one-half of the veins get on the external surface, and are either strongly attached to or pass in a doubling of the capsule of the kidney, and then pass along like the veins of the pia mater, afterwards joining the trunks from the inside just as they pass out. * * * The veins of the kidneys have in general nothing particular respecting them. They in common attend the arteries, or at least ramify similarly to the arteries, excepting in the lion and cat kind, as also in the hyæna, where some of the veins ramify on the surface, while the others are attending the arteries.' The reader will find in the Museum of the College of Surgeons some beautiful preparations illustrative of the kidneys, &c., of the *Felidæ:* they are numbered 1200 to 1205 both inclusive, 1218 to 1221 both inclusive, and 1284 (*Gallery*).

Blumenbach observes that in some species of the cat kind the glans is covered with retroverted papillæ, which, as these animals have no vesiculæ seminales, may enable the male to hold the female longer in his embraces. Most of the cats are retromingent, but not, as has been so often and erroneously repeated from the time of Aristotle, retrocopulant.

Brain, Nervous System, and Senses.—Blumenbach observes that the bony tentorium cerebelli constitutes in most species of the cat kind an uniform bony partition which leaves a quadrangular opening in the lower part of the cranium. In the cat the brain forms $\frac{1}{82}$ of the body, the proportion of the weight of the cerebellum to the cerebrum is as 1 to 6, and the breadth of the medulla oblongata after the pons varolii is to that of the brain as 8 to 22. In the Museum of the Royal College of Surgeons, No. 1321, (*Gallery*) is the brain of a tiger. The pia mater has been removed from the medulla oblongata, showing the transverse tract of medullary matter posterior to the tuber annulare, called *corpus trapezoideum;* this is traversed by the corpora pyramidalia. The development of the cerebrum is such as not only to cover the optic lobes or bigeminal bodies, but also the anterior half of the cerebellum itself; and the surface of the cerebrum is augmented by convolutions, of which one is analogous to the single convolution in the agouti, and extends parallel with the fissure dividing the hemispheres; a second runs parallel with and external to the preceding; a transverse one proceeding from the mesial fissure marks off what may be regarded as the anterior lobes, which, together with the lateral regions of the hemispheres, are traversed by other anfractuosities. No. 1325 is the brain of a lion, closely resembling the preceding in general form and disposition of the convolutions. No. 1326 is the brain and part of the spinal chord of a young lion, with the vessels of the pia mater minutely injected. The left lateral ventricle is exposed, showing the pes hippocampi and the choroid plexus. The fourth ventricle is also laid open, and contains a similar plexus of minute arteries. Bristles are inserted into the hollow olfactory and the optic nerves, and black threads are tied round the origins of the remaining cerebral nerves of the right side. A small quill is placed in the infundibulum; but the pituitary gland, which may be seen in both the preceding specimens is here removed. The union of the vertebral arteries to form the basilar artery, the great length of that vessel, and its division to join with the internal carotids in the formation of the circle of Willis, are well displayed. No. 1326 is a portion of the basis of the brain of a lion, prepared to show the form and relative proportions of the bigeminal bodies or optic tubercles; of these, the posterior, though smaller in longitudinal diameter, are broader, and rise above the level of the anterior pair. No. 1372 and No. 1373 are two highly interesting preparations of the spinal chord and cauda equina of the lion. (*Catalogue*, vol iii.)

Taste and *Touch.*—For illustrations of the former sense we refer the reader to the descriptions of the preparations, Nos. 1509 to 1513, both inclusive, above given. The latter sense presents nothing particularly worthy of notice in the cats; the whiskers indeed are provided with very large nerves, and may be serviceable in warning the animal in certain situations where they come in contact with any object.

Smell.—Blumenbach enumerates the cat kind among the animals remarkable for their acuteness in the sense of smelling, and as affording examples of a very complicated formation of the ethmoïd bone, both in regard to the elegant structure of its cribriform lamella, and to the wonderful convolutions of its turbinated portions, which procure as large a surface as possible within the confined space of the nasal cavity, for the application of the Schneiderian membrane. The *conchæ narium inferiores* are also much convoluted. There is in the Museum of the College of Surgeons (*Gallery*) a preparation (No. 1552) of a longitudinal vertical section of the head of a leopard, showing the turbinated bones of the left side *in situ;* and another, No. 1553, of a longitudinal section of the side of the head of a young lion, showing the ossa turbinata *in situ* also. The following luminous description of the latter is given in the Catalogue. (*Physiological Series*, vol. iii.) The superior bone is of a conical form, extending along the whole of the roof of the nasal cavity, with its base opposite to the frontal sinus (which is here exposed), and its apex terminating above the anterior extremity of the inferior turbinated bone. It presents a smooth or uniform surface towards the nasal cavity, as may be seen in the preceding specimen; but the lamella forming this surface has been partially removed, showing the subjacent lamella, which is folded longitudinally: the more complicated disposition of the exterior lamella of the same bone is exhibited on the opposite side of the preparation, where the surface for the extension of the olfactory membrane is augmented by a series of deep arched folds, having their convexity upwards. The middle turbinated bone is also of a pyramidal form, its broad basis being applied to the cribriform plate of the ethmoïd bone, and its apex extending between those of the other two turbinated bones, but not reaching so far forwards. The nasal or mesial surface of this bone is complicated by numerous deep furrows, two of which extend longitudinally, parallel with the superior margin of the bone, while the others radiate in an irregular manner from the lower point of attachment. The lateral surface of the bone is less

complicated and extensive. The inferior and anterior turbinated bone is of an elongated form, and contracted at both extremities. Its posterior and inferior extremity is attached to the outer parietes of the nasal passage, below the middle of the turbinated bone: from this point it extends obliquely upwards, enlarging as it crosses the anterior extremity of the middle bone, and then diminishing in size to its anterior and superior attachment behind the external nostril: from its position therefore the odorous particles in inspiration must first impinge upon this bone. Its nasal surface is pretty uniform, presenting only one curved groove, parallel with and near to the lower margin of the bone, in this respect differing widely from the lower turbinated bone in the hare: its exterior surface is similarly characterized. In the preparation the outer lamella has been cut away to show the subjacent fold. The whole being minutely injected, the vascularity of the pituitary membrane extended over this vast and complicated surface is well displayed. The pituitary membrane is evidently thickest and most vascular at the anterior part of the cavity, where it must receive the first impression of the external air. A portion of the pituitary membrane is reflected from the base of the middle turbinated bone, showing the fibres of the olfactory nerves spreading over it. In No. 1554 (the opposite section of the same head) and No. 1555 (the intermediate section) this part of the organization is still further illustrated.

Hearing.—This sense is acute in most of the cats. There is, in the greater number of mammiferous quadrupeds, connected with the tympanum another cavity which Blumenbach compares, with regard to the situation of the bony organ that contains it, to the mastoïd cells in the temporal bone of man. In several animals (and the cat is one of them) this organ is a mere bony cavity. The *ossicula auditûs*, considering the *lenticulus* as only a process of the *incus*, are three, as in the human subject. In the Museum of the College of Surgeons there is a preparation (No. 1600, *Gallery*) of a section of the cranium of a young lion, including the organ of hearing of the left side. A part of the meatus is preserved with the membrana tympani, and the cavity of the tympanum is laid open, showing the convexity of the membrane turned towards it, as in most mammalia. (*Catalogue*, vol. iii.)

Sight.—This sense is acute in the *Felidæ*, and they have the nictitating membrane very large and moveable. The pigment, as far as is known, is, generally speaking, of two colours, and the anterior perforation of the iris is formed of two segments of large circles joined, giving it a long and a short axis, the long axis being vertical. In the Museum of the College of Surgeons (No. 1710, *Gallery*) is the eye of a lion minutely injected by the ciliary arteries, and the sclerotic coat transversely divided, and reflected from the choroid, to show the vascularity of that tunic. No. 1730 is a preparation of the eye of a lion, showing the broad patch of tapetum lucidum below and also a little above the insertion of the optic nerve. The succeeding numbers to No. 1733 inclusive are also illustrative of this part of the organization in the lion and the leopard. John Hunter, *Observations on certain parts of the Animal Œconomy*, 2nd. edit., p. 243) remarks, that when the pigmentum is of more than one colour in the same eye, the lighter portion is always placed at the bottom of the eye, in the shape of a half-moon with the circular arch upwards; the straight line or diameter passing almost horizontally across the lower edge of the optic nerve, so that the end of the nerve is within this lighter-coloured part, which makes a kind of semicircular sweep above it: and he observes that the shape is peculiar to the cat, lion, dog, and most of the carnivorous tribe. Mr. Owen observes that the *Cheetah* has the circular pupil of the *Lion, Tiger, Leopard*, and *Jaguar*. (*Zool. Proc.*, 1833.)

Natural History.

The osteology of the Felidæ presents little for the distinction of species, except size, and in no animals does specific character depend upon size and colour more entirely than it does in this family. There are indeed differences: such, for instance, as that pointed out by Mr. Owen between the skull of the lion and that of the tiger; but, taken as a whole, the skeleton of a cat is very nearly the miniature representation of that of a lion or a tiger. We accordingly find that the disposition of many leading zoologists has been to bring all the numerous species under one genus. Linnæus arranges them under *Felis*, the third genus of his order *Feræ*, placing them between the dogs (*Canis*) and *Viverra*. Illiger assigns to them a position in his order *Falculata*, with the title *Sanguinaria*. Cuvier places them under the name of *Les Chats* (*Felis*, Linn.) among his *Carnivores*, the third family of his *Carnassiers*, between the *Hyænas* and the *Seals*. Temminck regards the genus *Felis* as an indivisible group zoologically, but separates them into two sections, the first comprising those which are found in the Old Continent and its Archipelagos, eighteen species in number; the second those which occur in the New World, of which he enumerates nine species. C. L. Bonaparte, prince of Musignano, admits into his family *Felina* the genera *Proteles*, *Hyæna*, and *Prionodon*, a very questionable admission. Dr. Leach gives the *Lions* a generic distinction with the name *Leo*. The *Lynxes* are separated as a genus by Mr. Gray, under the title of *Lynchus*; and the *Hunting Leopard*, *Felis jubata*, is characterized, generically by Wagler as *Cynailurus*. The whole family may be popularly divided into Lions, Tigers, Leopards, Lynxes, and *Wild Cats*, or *Cats* properly so called, the two latter terms being more particularly applicable to the smaller forms. Under the first four titles will be found in this work the notices of those subdivisions, and we shall in the present article treat specially of the latter subdivision only.

Geographical Distribution of the Felidæ.—The form is widely spread over the face of the earth; but reaches its most powerful development in the warmer climates. With the exception, however, of New Holland and the islands of the Southern Pacific, species are found in every part of the world, excepting the arctic regions; and some extend far beyond the limits of moderate temperature and even into districts where the severity of the cold is almost arctic. No species has yet been discovered common to the Old and New World.

Cats.

Among the smaller species of the great feline family our attention is naturally first directed towards that domestic animal which is found in almost every house. 'In this case,' says the author of that interesting little book *The Menageries* (Lond. 12mo. 1830), 'unlike that of the dog, there is no doubt which is the original head of the domesticated stock. The wild cat of the European forests is the tame cat of the European houses; the tame cat would become wild if turned into the woods; the wild cat at some period has been domesticated, and its species has been established in almost every family of the Old and New Continent.' There is good authority for this assertion; but the origin of the domestic cat has been attributed to a very different source, and there are not wanting zoologists who even now hold that the parent stock of that useful animal is still undiscovered.

Rüppell during his first travels in Nubia discovered a cat (*Kleinpfötige Katze*, *Felis maniculata*) of the size of a middle-sized domestic cat, and one-third smaller than the European wild cat (*Felis Catus ferus*, Linn.). All the proportions of the limbs were on a smaller scale, with the exception of the tail, which is longer in *Felis maniculata*. The woolly or ground hair is in general of a dirty ochreous, darker on the back and posterior parts, and becoming gradually lighter on the anterior and lateral parts; longer hair of a swarthy dirty white, so that the appearance of the animal is greyish-yellow. Skin of the edges of the lips and of the nose bare and black. Beard and bristles of the eyebrows shining white, brown at the roots; edges of eyelids black; iris glaring yellow. From the inner corner near the eye there is a dark-brown streak running in the direction of the nose, and there is a white streak as far up as the arch of the eyebrows; between these two streaks is another greyish one extending on the forehead by the side of the ears and under the eyes. Outside of the ears grey, inside white and without tufts of hair. Eight slender black undulating lines arise on the forehead, run along the occiput, and are lost in the upper part of the neck. Cheeks, throat, and anterior part of the neck shining white. Two ochreous-yellow lines spring, the one from the outer corner of the eye, the other from the middle of the cheek, and meet both together under the ear; and two rings of the same colour encircle the white neck: below the rings there are spots of ochreous yellow. Chest and belly dirty white with similar spots or semicircular lines. A dark streak along the back becomes lighter as it rises over the shoulders, and darker on

the cross. This streak is gradually lost on the upper part of the tail, the lower surface of which is white-yellow. The tail is almost of an equal thickness, rather slender, and with two dark rings at its point. The extremities, which have less hair in proportion on the outer side, are of the general colour, with besides five or six blackish semicircular bands on the fore-legs, and six distinct dark cross streaks on the hind-legs. The inner sides are lighter in colour, with two black spots or streaks on the upper parts of the fore-legs, and the hind extremities show the cross streaks winding around the thighs towards the inside. Foot, soles, hind parts of ankles, and wrists shining black. Length two feet five inches, the tail being about nine: height at the shoulder about 9½ inches. The description was taken from an aged female. M. Rüppell, who found this cat west of the Nile, near Ambukol, in rocky and bushy regions, is of opinion that there can be no doubt that it is descended from the domestic cat of the antient Egyptians, now to be traced in the cat-mummies and their representations on the monuments of Thebes. In the 'Description de l'Egypte, Hypogées de Thebes,' vol. ii. pl. 45, No. 14, is the representation of a cat. Pl. 51, No. 3, shows a cat's mummy, and pl. 54, No. 7, the skeleton of a cat's mummy which in size of body, form of head, and length of tail accords perfectly with *Felis maniculata*. The question then arises whether this domestic cat might not have been transferred or bequeathed to the contemporary civilized Europeans by the Egyptians; and the superintendents of the Frankfort collection agree that the general facts strongly favour the opinion that *Felis maniculata* is the type of our domestic cat. M. Temminck concurs in opinion with M. Rüppell that this Nubian species is the stock from which it sprung. Sir William Jardine, in his able *Natural History of the Felinæ* (*Naturalist's Library, Mammalia*, vol. ii., small 8vo., Edinburgh and London, 1834), states that the opinion generally accepted before this by most naturalists was, that the wild cat of Europe was the original stock: but, he adds, that although, since the introduction of our house cat to this country, there may have been an accidental cross with the wild native species, an attentive examination of the greater numbers will at once show a very different form from that exhibited by the wild cat; the most prominent distinctions being the shortness of the legs and shortness and thickness of the tail in the latter. 'The domestic cat,' continues this author, 'is the only one of this race which has been generally used in the economy of man. Some of the other small species have shown that they might be applied to similar purposes; and we have seen that the general disposition of this family will not prevent their training. Much pains would have been necessary to effect this, and none of the European nations were likely to have attempted it. The scarcity of cats in Europe, in its earlier ages, is also well known, and in the tenth and eleventh centuries a good mouser brought a high price. Although, however, our opinion coincides with that of the above-mentioned authorities, and we think that we are indebted to the superstition of the antient Egyptians for having domesticated the species described by Rüppell, we have no doubt that since its introduction to this country, and more particularly to the north of Scotland, there has been occasional crossing with our own native species, and that the results of these crosses have been kept in our houses. We have seen many cats very closely resembling the wild cat, and one or two that were very tame, which could scarcely be distinguished from it. There is perhaps no animal that so soon loses its cultivation, and returns apparently to a state completely wild. A trifling neglect of proper feeding or attention will often cause them to depend upon their own resources; and the tasting of some wild and living food, will tempt them to seek it again, and to leave their civilized home. They then prowl about in the same manner as their congeners, crouching among cover, and carefully concealing themselves from all publicity. They breed in the woods or thickets, and support themselves upon birds or young animals. Few extensive rabbit warrens want two or three depredators of this kind, where they commit great havoc, particularly among the young in summer. They sleep and repose in the holes, and are often taken in the snares set for their prey. I once came upon a cat which had thus left her home: she had newly kittened in the ridge of an uncut corn-field. Upon approaching she showed every disposition to defend her progeny, and beside her lay dead two half-grown leverets.'

Before we quit this part of the subject we must not forget that among the animals seen by Rüppell in Kordofan he discovered a new small species of cat.

Mr. Bell (*History of British Quadrupeds*, Lond. 8vo. 1827) first addresses himself to the question whether the common wild cat is the original from which all our domestic cats have sprung, according to the general opinion of the older naturalists. He states that there are many reasons for believing that this opinion is entirely erroneous. In the first place, he observes, the general conformation of the two animals is considerably different, especially in the length and form of the tail, which in the wild cat is strong, robust, and at least as large towards the extremity, as at the base and middle, whilst that of the domestic cat tapers towards the apex. The fur too of the former, he remarks, is thicker and longer; and although the colours are somewhat like those which occur in some individuals of the ordinary species, there are, even in this respect, distinctions which can scarcely be considered otherwise than as essentially specific; as, for instance, the termination of the tail in a black tuft, which invariably marks the wild cat. To these distinctions may be added the difference of length of the intestinal canal; though domestication might account for much of that.

But to return to Mr. Bell. With regard to the alleged crossing between the wild and the domestic breeds, 'it is not without much reflection on the matter that he has come to the conclusion that this opinion of their intermixture, repeated and transmitted from one to another till it has become an uncontested dogma, is erroneous, and has its foundation in mistaken facts.' Mr. Bell then notices Rüppell's *Felis maniculata* above described, and comes to the conclusion that 'this species, to which the high authority of Rüppell has assigned the origin of our house cat, is still farther removed from it in essential zoological characters than even the British wild cat, to which it had been previously so generally referred; and that, as in the case of so many of our domesticated animals, we have yet to seek for the true original of this useful, gentle, and elegant animal.'

We must confess that we do not see much difficulty in coinciding with the opinion of Rüppell, Temminck, and Sir William Jardine upon the evidence at present known. It is not attempted to be denied that the Egyptians had a domestic cat, and we think there can be little doubt that the domestic cat of the Egyptians was identical with *Felis maniculata*. This extraordinary people, whose existence is now only to be traced in their wonderful and enduring monuments, were, when in their high and palmy state, the centre of civilization, and we can see no reason why other nations, who borrowed so largely from them, should not have also received their domestic cat among other benefits of civilization. This animal, when introduced, would be liable to all the usual consequences of domestication and of intermixture, according to the localities of the various nations who obtained it. We can see no reason why the domestic cat, from whatever source derived, should not breed with the wild cat in Great Britain, and we believe that it has so bred

Egyptian Cat. *Felis maniculata*.

The arguments derived from the difference between the tails of the wild cat, of the domestic cat, and of *Felis maniculata*, do not seem to us to carry much weight. We cannot shut our eyes to the effect of domestication on this organ among the dogs, which gives us every variety, from the well-clothed tail of the Newfoundland dog, setter, and spaniel, to that of the greyhound, which is so scantily furnished as to owe one of its excellencies to being 'tailed like a rat;' nay, in some varieties, that long tail is reduced to almost no tail at all. There are also tail-less cats, as Mr. Bell himself notices.

Still the doubt thrown on the question by a zoologist of so much experience and skill as Mr. Bell is deserving of the most serious consideration, and should stimulate those who have the opportunity to investigate the subject upon every occasion offered to them.

The domestic cat is *Le Chat* of the French, *Gatto* of the Italians, *Gato* of the Spanish and Portuguese, *Katze* of the Germans, *Cyperse Kat* and *Huyskat* of the Dutch, *Katta* of the Swedes, *Kat* of the Danes, *Cath* and *Gwr Cath** of the antient British, and *Felis domestica, seu Catus*, of Ray. The varieties, as in all cases of domestication, are endless: among the most noted are the Tabby, the Tortoiseshell, the Chartreux, which is bluish, and the Angora cat with its long silky hair. The domestic cat is but too famous for its attainments in the art of ingeniously tormenting, and it is difficult to say what end is answered by the prolonged agonies of fear and torture which the poor mouse is made to undergo before it receives the *coup de grace*. This refined cruelty appears to be confined to mice, young rats, and small quadrupeds: if a cat strikes down a bird, she does not trifle with it, but, conscious of its chances of escape, bites off its head or wounds it mortally at once.

We insert the following from Pennant, though it has been often quoted, not only as illustrating the manners of a period so distant as that of *Howel*, who died in the year 948, after a reign of 33 years over South Wales and of eight years over all Wales, but also on account of the reflection at the end, which we think worthy the consideration of those who are interested in inquiring whence the stock of the domestic cat was derived. 'Our ancestors,' says Pennant, 'seem to have had a high sense of the utility of this animal. That excellent prince, *Howel Dda* or *Howel the Good*, did not think it beneath him, among his laws relating to the prices, &c. of animals (*Leges Walliæ*, p. 247, 248), to include that of the cat, and to describe the qualities it ought to have. The price of a kitling before it could see was to be a penny; till it caught a mouse, twopence. It was required besides that it should be perfect in its senses of hearing and seeing, be a good mouser, have the claws whole, and be a good nurse; but if it failed in any of these qualities, the seller was to forfeit to the buyer the third part of its value. If any one stole or killed the cat that guarded the prince's granary, he was to forfeit a milch ewe, its fleece, and lamb; or as much wheat as when poured on the cat suspended by its tail (the head touching the floor) would form a heap high enough to cover the tip of the former. This last quotation is not only curious, as being an evidence of the simplicity of antient manners, but it almost proves to a demonstration that cats are not *aborigines* of these islands, or known to the earliest inhabitants. The large prices set on them (if we consider the high value of specie at that time) and the great care taken of the improvement and breed of an animal that multiplies so fast, are almost certain proofs of their being little known at that period.' (*British Zoology*.)

The *Wild Cat* is *Le Chat sauvage* of the French, *Gato montis* of the Spaniards, *Wilde Katze* and *Baumritter* of the Germans, *Vild Kat* of the Danes, *Cath goed* of the antient British, *Catus sylvestris* of Klein, *Felis Catus* of Linnæus, and *Felis sylvatica* of Merrett.

Description.—Head triangular, strongly marked; ears rather large, long, triangular, and pointed. Body strong, rather more robust than that of the domestic cat. Tail of equal size throughout its length, or rather larger towards the extremity. Fur soft, long, and thick; colour of the face yellowish gray, with a band of black spots towards the muzzle; whiskers yellowish white; forehead brown;

* It is worthy of remark that all these names are the same as the Latin *catus*, whence the diminutives *catulus* and *catellus*; and this is somewhat in favor of all northern and western Europe having received the cat through Roman civilization. We are thus brought nearer to Egypt, its probable origin. The Greek word *ailúros* (αἴλουρος) is an odd one, and helps us nothing, being apparently a descriptive term.

Wild Cat. Felis Catus.

head gray, marked with two black stripes passing from the eyes over and behind the ears; back, sides, and limbs grey, darker on the back, paler on the sides; with a blackish longitudinal stripe along the middle of the back, and numerous paler curved ones on the sides, which are darker towards the back, and become obsolete towards the belly, which is nearly white. Tail annulated with light grey and black; tip of the latter colour. Feet and insides of the leg yellowish grey; soles black, at least in the male, of which sex Temminck declares it to be a peculiarity. Colours of the female paler, and markings less distinct. Dimensions differing greatly according to the statement of various naturalists. Medium size of full-grown male:—

	Foot.	In.	Lines.
Length of head and body . . .	1	10	0
„ of head	0	3	8
„ of ears	0	2	3
„ of tail	0	11	2

Female rather smaller. (Bell.)

Temminck gives the average length as three feet.

Locality.—All the wooded countries of Europe, Germany especially; Russia, Hungary, the north of Asia, and Nepâl. The animal is larger in cold climates, and its fur is there held in higher estimation.

In Britain it was formerly plentiful, and was a beast of chace, as we learn from Richard the Second's charter to the abbot of Peterborough, giving him permission to hunt the hare, fox, and wild cat. The fur in those days does not seem to have been thought of much value, for it is ordained in Archbishop Corboyl's canons, A.D. 1127, that no abbess or nun should use more costly apparel than such as is made of lambs' or cats' skins.

The wild cat is now rarely found in the south of England, and even in Cumberland and Westmoreland its numbers are very much reduced. In the north of Scotland and in Ireland it is still abundant.

Among the foreign wild cats may be enumerated *Felis Chaus*, Guld.; the *Mota Rahn Manjur* or *Larger Wild Cat* of the Mahrattas (a lynx); and *Felis torquatus*, F. Cuv.; the *Lhan Rahn Manjur* or *Lesser Wild Cat* of the Mahrattas; *Felis Moormensis*, the *Moormi Cat*, Hodgson, from the Moormi Hills in Nepâl (*Zool. Proc.*, January, 1824). *Felis planiceps*, Vigors and Horsfield, departs in many points from the true cats, and approaches *Prionodon* in others. *Felis Temminckii* of the same zoologists, which is near the domestic cat in size, comes nearer in form—it is uniform in colour—to the true *Tiger Cats*, which will be noticed under the article on TIGERS. We must not omit to notice the *Felis Caffra*, a specimen of which is to be seen in the South African Museum (No. 28) specimens of which have been met with, as the Catalogue informs us, in whatever direction South Africa has yet been explored. 'It exhibits certain fixed peculiarities which unequivocally constitute it a distinct species from the domestic cat, which is occasionally found wild in the colony, and with which the former has sometimes been erroneously confounded. It possesses a full share of the ferocity of the feline tribe; and dogs which have once had a specimen of its pugnacious will

and power show a considerable degree of caution in encountering it a second time. It is frequently found in such flats as chance to be covered with long grass or with a moderate growth of brushwood; and when disturbed by the approach of men or dogs, usually seeks shelter in thickets, or the burrows of other animals. It preys upon small quadrupeds and birds, and is an especial enemy to those of the latter which have their nests upon the ground.' (*Catalogue of South African Museum.*)

FOSSIL FELIDÆ.

In the second or Miocene period of the tertiary formations we have hitherto found the first traces of large fossil cats. There are no less than four species of these great cats, some as large as a lion, enumerated by Professor Kaup from the Epplesheim sand near Altzey, about twelve leagues south of Mayence. These remains are preserved in the museum at Darmstadt. The professor names these *Felis aphanista, F. prisca, F. ogygia,* and *F. antediluviana.* In the third and fourth (or Pliocene), divisions of the tertiary periods, we find that the number of terrestrial herbivorous quadrupeds become more abundant; and, with their numerical importance, the *Carnivora,* whose agency was required for keeping them down, increase also. The remains of *Felidæ* occur in the ossiferous caverns, such as those of Kirkdale, Gailenreuth, &c.; and also in the osseous breccias (Nice, &c.). In the cave at Kirkdale the only remains that had been found of the tiger species, according to Dr. Buckland, were two large canine teeth, each 4 inches in length, and a few molar teeth: these exceeded in size those of the largest lion or Bengal tiger. Mr. Cottle of Bristol procured from Oreston Cave, Plymouth, among many other remains, two tusks of a tiger, one 3¾ inches long, the other 3¼, one from the upper, and one from the lower jaw. Dr. Buckland in the same work (*Reliquiæ Diluvianæ*) mentions that Cuvier had then lately found the tusks of an extinct lion or tiger in the breccia of Nice, and that Mr. Pentland had discovered the tooth of the same extinct tiger in the breccia of Antibes. Bavard, the Abbé Croizet, and Jobert, in the work on Fossil Cats, found, among the remains contained in the ossiferous rocks of Auvergne (Puy de Dome) the following species: *Felis Issidoriensis, F. brevirostris, F. pardinensis, F. Avernensis,* and *F. meganteron.*

FELIX I., a native of Rome, succeeded Dionysius the Calabrian as bishop of that city A.D. 271, and suffered martyrdom in 275. He was succeeded by Eutychianus, bishop of Luna. There is extant an epistle of Felix to Maximus, bishop of Alexandria, against Paul of Samosata.

FELIX II., by some styled III., on account of an antipope who assumed the title of Felix II. in the schism against Liberius (A.D. 355-66), was a native of Rome, and succeeded Simplicius in the year 483. He had a dispute upon questions of ecclesiastical supremacy with Acacius, bishop of Constantinople, who was supported by the emperor and by most of the eastern clergy; in consequence of which a schism ensued between the Greek and Latin churches, which continued after the death of Felix, which happened in 492. He was succeeded by Gelasius I.

FELIX III., also called IV., a native of Beneventum, succeeded John I. A.D. 526, and died in 530. He was succeeded by Boniface II.

FELIX V. [AMADEUS VIII.]

FELLOWSHIP, in books of arithmetic, the rule by which profit or loss is divided among those who are to bear it, in proportion to their investments or interests in the transaction. It is usual to divide this rule into two parts, of which the first supposes all the investments to have been made for the same time, and the second supposes the partners to have employed their money during different times. One simple case of each will be sufficient.

Question 1. A, B, and C embarked 10*l.*, 9*l.*, and 8*l.* in a venture which yielded 30*l.* of profit. How much belongs to each?

If 10+9+8, or 27 adventurers embarked 1*l.* each, it is clear that each of them should have the 27th part of 30*l.* Let 10 of them assign their shares to A, 9 to B, and 8 to C, and we have the case in question. That is A, should have 10-27ths, B 9-27ths, and C 8-27ths of the whole profit.

Question 2. A profit of 30*l.* was realized by A embarking 10*l.* for two months, B embarking 9*l.* for three months, and C embarking 8*l.* for four months. How much ought each to gain?

Here the 1*l.* of A and the 1*l.* of B are differently circumstanced: the second was employed half as long again as the first, and consequently should gain half as much again. Now let *one pound sterling employed during one month* be called a share: then A invested 20 shares, B 27 shares, and C 32 shares. Hence as before, 20+27+32 being 79, A should have 20-79ths, B should have 27-79ths, and C 32-79ths of the gain.

The first is a rule of very frequent occurrence, but the second is rare, for it seldom happens that money is withdrawn from an undertaking, except upon some specific agreement.

FELLOWSHIP (in a college) is an establishment in the college entitling the holder to a share in its revenues. The fellows are a part of the corporation. [COLLEGE.] Fellowships are either original, that is, part of the foundation or scheme of the original founder; or ingrafted, that is, endowed by subsequent benefactors of a college already established. Where the number of fellows is limited by the original foundation, new fellows cannot be made members of the corporate body without a new incorporation. If the number is not limited by the charter, it seems that the corporation may admit new fellows as members, who will be subject to the statutes of the original foundation in all respects. Graduates of each several college are in general only eligible to fill a vacant fellowship in the establishment to which they are elected after having undergone an examination by the master and fellows in being. But in some cases special rules which control the election prevail, as where the fellow must be of the blood of the founder, or where he must be a native of a particular county, &c., and in some few cases fellowships are open to the graduates of several colleges, or even the whole university. In Downing College graduates of both universities are eligible. These rules are prescribed by the founder, modified in some cases by the bye-laws of the several colleges. Some few fellowships may be held by laymen, but in general they can be retained only by persons already in holy orders, or who are ordained within a specified time. Fellowships are of unequal value, varying from 30*l.* and less to 250*l.* a year and upwards, the senior fellowships being in general the most lucrative; but all confer upon their holders the right to apartments in the college, and certain privileges as to commons or meals. They are in general tenable for life, unless the holder marries, or inherits estates which afford a larger revenue, or accepts one of the livings belonging to the college which cannot be held with a fellowship. These livings are conferred upon the fellows, who in general have the option of taking them in order of seniority, though in some colleges the holders of particular offices have priority of choice, as for instance in Trinity College, Cambridge, where the vice-master has such right by a bye-law of the college.

FELLTHAM, OWEN, lived in the time of James I.; but the particulars of his life are entirely unknown. To the lover of English literary antiquities he is known as the author of a curious book called 'Resolves,' consisting of pious and moral treatises collected into *centuries.* It somewhat resembles Lord Bacon's essays, and exhibits an exuberance of wit and fancy that is perfectly astonishing. Metaphor follows metaphor; and they are not merely introduced as an idle and unmeaning sport, but are the exponents of thoughts in themselves acute and profound. All liberal minds must admire the spirit in which the book is written. Felltham displays himself as a man delighting in reflection, and at the same time as a man of the world; as one of sincere and fervent piety, but at the same time as one of a cheerful and lively temper, loving the good things of this life, and always preserving a clear understanding. An excellent account of the book with copious extracts, will be found in the *Retrospective Review,* vol. x.

FELO-DE-SE (a felon of himself) is a person who, being of sound mind and of the age of discretion, deliberately causes his own death; and also in some cases, where one maliciously attempts to kill another, and in pursuance of such attempt unwillingly kills himself, he is adjudged a felo-de-se (1 Hawk. P. C. c. 27, § 4). When the deceased is found by the coroner a felo-de-se, all his chattels, real and personal, are forfeited to the crown, though they are, we believe, usually restored upon payment of moderate fees, and therefore a will made by him is void as to his personal estate, though not as to his real estate, nor is his wife barred of her dower. Formerly he was buried in the highway with

a stake driven through his body. These laws, so highly repugnant to the feelings of humanity, being a punishment to the surviving relatives of the deceased, in addition to the general impression that no man in his sound sense ever does commit suicide, caused juries in general to find that the deceased was not of sound mind; and by a recent enactment (4 Geo. IV. c. 52) the legislature has so far yielded to the popular and herein the better opinion, as to abolish the former ignominious mode of burial, and to provide that a felo-de-se shall be privately interred at night in the burial-ground in which his remains might by law have been interred if the verdict of felo-de-se had not been found against him.

FELONY, in the general acceptation of the English law, comprises every species of crime which occasioned at common law the forfeiture of lands or goods, or both, and to which a capital or other punishment might be superadded, according to the degree of guilt. Various derivations of the word have been suggested. Sir Henry Spelman supposes that it may have come from the Teutonic or German 'fee' (fief or feud) and 'lon' (price or value), or from the Saxon 'feelen,' to fall or offend. Capital punishment by no means enters into the true idea and definition of felony; but the common notion of felony has been so generally connected with that of capital punishment that law-writers have found it difficult to separate them: indeed, this notion acquired such force, that if a statute made any new offence felony, the law implied that it should be punished with death. The number of offences, however, to which this punishment is affixed by the law of England is now very small; and several statutes have been passed in the last session of parliament (1 Vict.) founded upon the principle that the punishment of death should only be inflicted for crimes accompanied with violence. Thus c. 84 substitutes the punishment of transportation for that of death in those cases where the latter might still be inflicted for forgery; c. 85 materially lessens the severity of the punishment of offences against the person; c. 86 enacts that burglary unaccompanied with violence shall no longer be punished capitally, and provides that, so far as the offence of burglary is concerned, the night shall be considered to commence at nine in the evening and to conclude at six in the morning; c. 87 mitigates the punishment attending the crimes of robbery and stealing from the person: c. 88 renders piracy punishable with death only when murder is attempted; c. 89 regulates the punishment for the crime of arson; c. 90 mitigates the punishment of transportation for life in certain cases; and c. 91 abolishes the punishment of death in the cases there specified. (14 *Leg. Obs.* 426.) Great numbers of offences were formerly liable to this severe punishment; and it must seem strange to persons who do not observe the extreme difficulty with which old established customs and prejudices, however ill founded, are subverted, that this system should so long and so obstinately have withstood the most convincing arguments and conclusive statistical evidence. It is impossible, within the limits of this article, to enumerate the crimes which the law considers to be felonies; and the more so, as the word felony has long been used to signify the degree of crime rather than the penal consequences. It may be sufficient, therefore, to state generally, that murder, manslaughter, felo-de-se, robbery, arson, burglary, offences against the coin, &c. are considered and classed as felonies.

Besides the special punishment affixed to his crime by the law, a felon upon conviction forfeited the rents and profits of his lands of inheritance during his life to the king (which are now usually compounded for), and also all his goods and chattels absolutely; and as attainder of felony caused corruption of blood, his lands, except of gavelkind tenure, escheated to the lord of the fee. This last consequence, however, was taken away by stat. 54 Geo. III. c. 145, which enacted that, except for treason or murder, corruption of blood should not follow attainder; and as difficulties might sometimes occur in tracing descent through an ancestor who had been attainted, it was, by the 3 and 4 Will. IV. c. 106, § 10, enacted that descent may be traced through any person who shall have been attainted before such descent shall have taken place. [ESCHEAT; FORFEITURE.]

In connexion with this subject it may be interesting to refer to the distinction formerly taken between felony with and without benefit of clergy, as explained in the article BENEFIT OF CLERGY.

FELSO-BANYA. [SZATHMAR.]

FELSPAR, a mineral which occurs in every part of the earth, and one of the constituents of granite.

It occurs *crystalline* and *massive*. The primary form of the crystal is an oblique rhombic prism. Colour white, grey, green, red, of different shades. Transparent, translucent, or opaque. Lustre vitreous. Sp. gr. 2.5, 2.6. Hardness 6.0. Streak greyish white. Cleavage parallel to the terminal plane and oblique diagonal. Fracture conchoidal, uneven.

The variety known by the name of *adularia* occurs in large crystals, especially in Mont St. Gothard. *Moon-stone* is a variety which has a pearly lustre, and when cut and polished is chatoyant; the finest specimens of this are from Ceylon.

Massive varieties.—Amorphous. Structure granular, compact. A green variety has been found in Siberia. The several varieties differ but little in composition. *Adularia*, which is one of the purest varieties, according to Vauquelin, consists of

FELT, FELTING. [HAT.]

FELTON. [BUCKINGHAM, DUKE OF.]

FELTRE. [BELLUNO.]

FELUCCA (Felúca in Italian, Felouque in French, Falúca or Falúa in Spanish), a vessel or small craft used in the Mediterranean for coasting voyages, being propelled both by oars and sails. It may be said to be a small galley. The feluccas carry two masts, main and fore, with lateen sails. They are very frequent on the coast of Italy, Spain, and the Levant. There are also armed feluccas which carry two guns, and which are in fact a kind of gunboats, and larger and stronger built than the merchant felucca. (*Encyclopédie Methodique, Marine*, art. *Felouque.*)

FEME-SOLE. [WIFE.]

FEMERN. [SCHLESWIG.]

FEMININE. [GENDER.]

FENCES are necessary wherever cattle are depastured and properties divided: and according as they are intended to prevent men or cattle from trespassing over them, they are formed of various materials and dimensions.

When a park is inclosed to keep in deer and game, the best fence is a stone or brick wall, well built with lime mortar: but as this is expensive where stone and lime are not at hand, the common *park-paling* is more frequently met with. This is composed of posts and rails of oak morticed and pinned together, and split pales of the same material nailed upon these in an upright position. The pales are split out of the trunks of oaks, where there are no branches or knots, when the sap is still in them. They are about half an inch thick and with feather edges, that is, diminishing in thickness from one side to the other: their usual width is five inches. When they are nailed on the rails, which are usually of a triangular form, the thickest edge of one pale is nailed over the thinner edge of the preceding, forming thus a very close fence. Every alternate pale is placed three or four inches higher than its neighbour, which gives the top of the fence a castellated form. This is not done merely for the appearance; but it makes it more difficult to climb over, and the deer are not so apt to leap at it as if the top were a straight line. The distance between the posts is usually nine feet; and the three rails with the pales nailed on them is called a pannel, and may be conveniently moved at once when any alteration in the fence is required. A whole fence may be moved at a small expense, merely by digging out the posts, and placing them elsewhere. The pannels come in regularly, and are pinned into the old mortices in the posts. Sometimes the pales are nailed at a distance from each other, which makes the *open-paled fence*, and the pales are then generally cut to a point at top. This fence is peculiar to Great Britain and Ireland and is very seldom found on the Continent.

In the Jura and the Alps, where wood abounds, a rough fence is frequently made with strong split pieces of wood, which are fixed obliquely in the ground and supported at the upper end by two others placed in the form of a cross. It is not a very strong fence, but it is sufficient to prevent the cows from straying, for unless a bull with his horns makes a gap in it, they will not attempt to pass it.

In wild mountain pastures in Scotland and Ireland it is usual to separate the properties of different individuals or that of parishes by rough stone walls put together without any mortar. The materials are generally at hand, and a rough and efficient fence is made without much labour.

Some of these walls are built with considerable skill, and are very durable; especially if the stone is of a nature to split with a flat surface; in which case a dry wall may be built which has all the appearance of one built with mortar. Sometimes a layer of mortar is laid on the stones at a little distance from the ground and another near the top. The coping is usually made of flat stones, which are sometimes placed on edge in a direction across the wall, and wedged together along the top of it or set in mortar, forming a very rough coping, which it is not easy to get over.

Where stones are not at hand, or less trouble is taken, a high bank of earth faced with sods of grass is substituted for a wall. This is not so durable and is more easily surmounted, unless a hedge of some kind be planted along the top. Furze seed is often sown for this purpose, and soon forms an excellent fence, which by proper care and clipping will last a long time. But the most common kind of fence for fields is the hedge and ditch, the bank being raised with the sods and earth taken out of the ditch, and the hedge planted in the side of the bank towards the ditch, or on the top. Sometimes there is a ditch on both sides. In flat wet lands this last is extremely useful, not only as a fence but as a drain for the superfluous water. When the ditch is intended to carry off the water, and there is only one, it is of consequence that it should be so placed as to answer this purpose effectually; it should therefore always be on that side of the bank where the ground rises, for otherwise the bank will impede the natural flow of the water, and it will be necessary to cut through it in different places to let the water running from above have an outlet into the ditch. In some extensive inclosures of land great inconvenience has arisen from the neglect of the surveyor in not attending to this circumstance and setting out the bank on the upper side. Where they are not required as drains, it is a great waste of land to have any ditches, and a simple hedge planted on the surface of the soil is much to be preferred. Of all fences a live hedge, which is carefully planted, and kept properly cut, and trimmed when it is grown up, is by far the best. [HEDGE.]

When a fence is required within sight of a dwelling, and it is desirable for it to be concealed, a deep ditch is sometimes dug, and a fence placed in the bottom of it at such a depth as not to appear above the level of the ground. This is called a *sunk fence*. Sometimes a wall is built against a perpendicular side of a ditch, and some very light fence is placed obliquely outwards near the top of it and level with the ground. This is called a *ha-ha fence*, a name given to it from the surprise excited in a person unacquainted with it, when he suddenly finds himself on the top of a wall with a deep ditch before him. When it is desired to keep off sheep or cattle from a lawn or pleasure-ground without obstructing the view of the park or the fields, the ha-ha fence is very useful. A variety of *light fences of iron* have been invented for the same purpose: some of these are fixed and others moveable: some have upright pieces of cast-iron as posts let into oak blocks sunk in the ground, and rods of wrought-iron passing through holes in the uprights: some have wire for the same purpose. But the most common iron fence is composed of separate wrought-iron hurdles, which may be moved at pleasure, and are kept together by screwed pins and nuts. They are merely stuck into the ground, for which purpose they have the ends of the uprights sharpened and bent so as to form a foot. By having this bend alternately on the right and on the left, they form a very firm basis when two hurdles are joined, the left foot of the one being strengthened by the right foot of the other. A very neat fence may be made at a small expense by using as posts pieces of young larch trees about four or five inches in diameter, with the bark on, and passing iron rods through holes bored in them at certain distances from each other. A fence of this kind, five feet high, with five horizontal rods five-eighths of an inch in diameter, is an excellent protection against cattle, and takes up no ground.

The greatest objection to the ditch and bank fence is that it takes up so much room. If the ditch is three feet wide, the bank will be the same. There is a foot along the ditch, and another along the bank, where the plough cannot reach; there are therefore eight feet lost. If the fields are squares of ten acres each, which is a convenient size, each field will have 1320 feet of fence in length, taking up 10,560 square feet of land, which is nearly a quarter of an acre. If to this be added the outer fences against roads, woods, or commons, it will be found that nearly one acre in 25 is taken up by banks and ditches. It is therefore a great saving to have a simple hedge without any ditch wherever the land is well drained or has a porous subsoil.

It is usual in England to plant trees in the hedge rows; and it is owing to this practice that England presents such a rich garden-like appearance, wherever there is a hill which enables one to see any extent of country. But trees are a great detriment to the farmer; and where the land is highly manured, the trees draw off much of the rich juices. The prudent tenant considers this in the rent; and although the landlord may now and then sell some timber, he pays dear for it in general by the annual deduction from his income on their account. Stone walls have a dreary appearance to the eye, but they are excellent fences; they take up little ground, they draw nothing out of the soil, they harbour no birds, and they are the best shelter against cold winds in spring. In an agricultural point of view, therefore, walls are to be preferred, unless the soil be favourable to the growth of the white-thorn or the holly; for clipped hedges are kept up at a much smaller expense than walls; and where there is no ditch, hedges take up as little room.

When hedges are preferred, whether with or without a bank and ditch, they must be protected until they are of a certain age; and for this purpose there are particular kinds of fences. When there is a bank and double ditch, and the hedge is planted on the top of the bank, which makes by far the most efficient fence, there are usually two fences, one on each side of the bank. These fences are made of rough posts, and rails morticed into the posts. The posts are a foot or 18 inches in the ground, and 2 feet 6 inches out. They are placed in the side of the bank, inclined somewhat outwards, about 4 feet 6 inches asunder. The two rails are let into mortices in the alternate posts, and nailed to the middle post, which is rather slighter. Thus a very formidable fence is made, which those who follow the diversion of hunting, and are not very well mounted, dread to encounter. If there is only a single ditch, it is usual to plant the hedge in the side of the bank a little above the level of the ground. To protect the young thorns from being cropped by the cattle, it is usual to make a dead hedge of stakes with bushes and brambles interwoven on the top of the bank; and if there is pasture land on the side where the ditch is, a post and rail fence is put up along the edge of the ditch till the hedge is grown sufficiently not to be injured by the cattle. When branches of thorns and bushes only are used without stakes, it is called a *foot hedge*; when the branches are interwoven, and the top of the hedge is finished with rods wattled in, it is called a *stake and edder hedge*. Wherever neatness and durability are consulted, the stake and edder hedge is always preferred.

Besides these common fences, there are various others of a light or temporary nature, which are chiefly used in gardens and pleasure-grounds, and also when sheep only are to be kept out, or when a new quick hedge along an orchard or garden has been planted. A cheap and neat fence of this kind is made with stakes only planted in the ground, forming a series of St. Andrew's crosses; or with osier or hazel rods worked between stakes like basket-work, either horizontally and lightly or obliquely and closely. When the rods are split, the appearance is still neater and lighter. A variety of light iron fences made of slender rods or wire have been invented to protect flower-gardens or shrubberies from the depredations of hares and rabbits, and their forms differ according to the fancy and taste of individuals.

FENELON, FRANÇOIS DE SALIGNAC DE LAMOTHE, was born at the Château de Fenelon, in Périgord, in the year 1651. So rapid was his progress that he preached a sermon at the early age of fifteen before a select assembly at Paris, whither he had been called by his uncle, the Marquis de Fenelon, who afterwards fearing lest the praises of the world should create pride and vanity caused him to enter the seminary of St. Sulpice, and there for several years imitate 'the silence of Jesus.' Here he took orders. His first work was a treatise, 'De l'Education des Filles,' which is well known, and has been translated into our language. The intimacy which he formed with

Bossuet, and Bossuet's example, led him to write a treatise against heretics, entitled 'Du Ministère des Pasteurs,' in which heretics are attacked, though with more moderation than they had been by Bossuet. Fenelon being intrusted by Louis XIV. with a mission to Poitou, to convert the Protestants, nobly refused the aid of dragoons, and employed persuasion alone as an instrument of conversion. His conduct on this occasion gained him many friends. In 1689 he was appointed tutor to the young duke of Burgundy, which brought him into attendance on the court. Though the polish and grace which pervade his writings extended to his conversation, he never seems to have been a great favourite of Louis; his political opinions always tended to liberality, and in a letter to Mad. de Maintenon he animadverted rather freely on the character of the king. Notwithstanding this, after he had been tutor for five years, Louis made him archbishop of Cambray. Unfortunately, at the very moment when he had gained this elevated post, that series of events commenced which caused his future disgrace. He formed an acquaintance with the celebrated quietist, Mad. Guyon, who was at first in high favour with Mad. de Maintenon, and who was encouraged by her to spread her doctrines at St. Cyr. This lady was afterwards persecuted by Bossuet; and as Fenelon was suspected of favouring her doctrines, Bossuet required him to condemn them. Not only did Fenelon refuse, but he published a book called 'Explication des Maximes des Saints,' in which the principles of quietism were openly avowed. Upon this, Bossuet denounced him to the king as a heretic. To increase his troubles, his palace caught fire about the same time, and all his MSS. and books were destroyed. The persecution of Bossuet continued; and the protection of Mad. de Maintenon, who had at first encouraged Fenelon, was withdrawn. Bossuet required that the difference should be settled by a controversy: Fenelon would not accede to these terms, but offered to submit his book to the tribunal at Rome. His persecutor however succeeded so far as to cause him to be banished from the court, and endeavoured, though unsuccessfully, to involve Beauvilliers, governor to the duke of Burgundy, in his disgrace. Pope Innocent VIII., though strongly urged by Louis, was not willing at once to condemn a prelate so noted for learning and piety, and a violent paper war was waged by both parties. At last the papal letter arrived, and the archbishop of Cambray was forced to submit; he signed a renunciation, and would have been restored to regal favour had not the celebrated romance of 'Telemaque,' which he had written some years before, been published against his will through the treachery of a servant. Several passages in this work were suspected by Louis to be directed against himself; it was suppressed in France, but rapidly circulated in Holland. Hearing of the unfortunate impression which his book had made, Fenelon resolved to remain quietly in his diocese. Cambray being situated on the frontiers of France, he was visited by many illustrious foreigners. Fenelon's acts of benevolence were munificent: in the year 1709 he fed the French army at his own expense. It has been already remarked that his political opinions were liberal; he had always conceived it just that the people should have a share in the government, and it was expected that the duke of Burgundy would have acted in accordance with his preceptor's views. But all hopes of this sort were cut off by the sudden death of that prince. Fenelon himself died in 1517.

The works of Fenelon are very numerous; consisting, besides the romance of 'Telemaque,' of a variety of religious and moral treatises. 'Telemaque' has been translated into every European language, and is read at almost every European school. Had it been written in this age, it is questionable whether its popularity would have been so great; the spirit of the Greeks is much better understood than it was formerly, and the classic reader, though he may admire the language of 'Telemaque,' as well as the general accuracy of the writer's information on matters of antient history and geography, will find it strange that the sentimental speeches, though good in themselves, should flow from the mouth of Homeric heroes, who of all beings were the least moralising, in the modern sense of the word. His religious and moral essays are only calculated for persons in whose mental constitution warmth and susceptibility are predominant, and who can suffer themselves to be led on by the fervour and eloquence of the author. To the cool and more intellectual inquirer after truth his works will be diffuse and tedious. So much use does he make of the imaginative faculties, that he exhorts teachers to impress on the minds of children that the Deity is sitting on a throne, with very bright eyes looking through everything, and supporting the universe with his hands. Hence his natural theology is chiefly the ejaculation of a pious man admiring the works of Nature. In politics, Fenelon's opinions are far in advance of his age and country: in one of his treatises he declaims against checking liberty of conscience, and boldly proclaims the injustice of levying taxes without the sanction of a parliament. A handsome quarto edition of his works was published at Paris in 1787.

FENNEC. [Fox.]

FENNEL. [FŒNICULUM.]

FENTON, ELIJAH, was born in Staffordshire in the year 1683. Being designed for the church, he was admitted a pensioner of Jesus College, Cambridge, in 1700. After taking a bachelor's degree, he was forced to leave the university in consequence of being a non-juror. He became secretary to the earl of Orrery, and accompanied that nobleman to Flanders. After his return to England in 1705, he accepted the situation of assistant at Mr. Bonwicke's school at Headly in Surrey, and subsequently became head-master of the free grammar-school at Sevenoaks in Kent. Mr. St. John (afterwards Lord Bolingbroke) persuaded him to retire from this school, promising to do great things for him, which promises were never fulfilled. Lord Orrery again befriended him, and made him tutor to his son, Lord Broghill. This office lasted for six or seven years, during which Fenton became acquainted with Pope, and assisted him in the translation of the 'Odyssey.' The first, fourth, nineteenth, and twentieth books are said to be the work of Fenton. In 1723 he produced at the theatre in Lincoln's Inn Fields a tragedy called 'Mariamne,' which was so successful that he is reported to have gained 1000*l*. by its representation, and to have employed great part of the money in paying off the debts which St. John's conduct had caused him to incur. In 1727 he revised a new edition of Milton's works, and prefixed a life of the author; and in 1729 he published a fine edition of Waller. Through the recommendation of Pope, he became tutor to the son of Lady Trumbull; and when that occupation was at an end, she made him auditor of her accounts. He died in 1730.

All biographers bear testimony to Fenton's character as an upright and honourable man. His poetical works are but few in number, and consist of short pieces, chiefly paraphrases from the antients. As they have scarcely any merit but that of correct versification, they will probably never be rescued from the neglect into which they now have sunk. The tragedy of 'Mariamne,' like most of that time, is totally forgotten.

FENUGREEK. [TRIGONELLA.]

FEOD. [FEUDAL SYSTEM.]

FEODO'SIA. [KAFFA.]

FEOFFMENT (in law) is that mode of conveyance of lands or real hereditaments in possession where the land passes by force of livery in deed, *i. e.* actual delivery of a portion of the land, as a twig or a turf; or where the parties being on the land the feoffor expressly gives it to the feoffee, &c.; or livery in law or within view, *i.e.* where the parties being within sight of the land, the feoffor refers to it and gives it to the feoffee. A feoffment was the earliest mode of conveying real hereditaments in possession known to the common law. A grant [DEED; GRANT] was the mode used when lands subject to an existing estate of freehold, and when rents or other incorporeal hereditaments incapable from their nature of being the subjects of livery, were transferred. The term feoffment is evidently of feudal origin, its latinised form being feoffamentum, from feudare or infeudare, to infeoff, to give a feud. The mode of conveyance is however of much higher antiquity than the feudal system, the mode of transferring property by the delivery of possession being common to all nations in rude ages. (Gilb. *Ten.* 386.) It prevailed amongst the Anglo-Saxons, who gave possession by the delivery of a twig or a turf, a mode still common, particularly in the admission of tenants of copyhold lands. The form of an antient feoffment was singularly concise. There is a copy of one in the Appendix to the 2nd vol. of Blackstone's *Commentaries*, No. 1.

The essential part of this mode of conveyance is the delivery of possession, or, as it is technically called, livery of seisin. In former times land was frequently conveyed without any deed or writing, by simple delivery. Subsequently

it became the custom to have a written instrument called the charter or deed of feoffment [CHARTER], which declared the intention of the parties to the conveyance. But now, since the Statute of Frauds (29 Car. II. § 3), a written instrument is necessary. Still however the land passes by the livery, for if a deed of feoffment is made without livery, an estate at will only passes [ESTATE]; though if livery is made, and the deed does not express that the land is conveyed to the feoffee and his heirs, an estate for the life of the feoffee only will pass. No less estate than an estate of freehold can pass by a feoffment with livery, the livery being in fact the investiture with the freehold.

Livery of seisin, of both the kinds previously mentioned, was at first performed in the presence of the freeholders of the neighbourhood, vassals of the feudal lord; because any dispute relating to the freehold was decided before them as pares curiæ, 'equals of the court,' of the lord of the fee. But afterwards, upon the decay of the feudal system, the livery was made in the presence of any witnesses; and where a deed was used, the livery was attested by those who were present at it.

Livery in deed may be made by the feoffor or his attorney to the feoffee or his attorney. When lands lie in several counties, as many liveries are necessary; and where lands are out on lease, there must be as many liveries as there are tenants, for no livery can be made but by the consent of the tenant in possession, and the consent of one will not bind the rest. But livery in law or within view can only be given and taken by the parties themselves, though lands in several counties may pass if they all be within view. Livery of this nature requires to be perfected by subsequent entry in the lifetime of the feoffor. Formerly, if the feoffee durst not enter for fear of his life or bodily harm, his claim, made yearly in the form prescribed by law, and called continual claim, would preserve his right. The security of property consequent upon the progress of civilization having rendered this exception unnecessary, it was abolished by the recent Statute of Limitations, 3 & 4 Will. IV., c. 27 § 11.

Since the Statute of Uses [BARGAIN; SALE; USES] has introduced a more convenient mode of conveyance, feoffments have been rarely used in practice, and then rather for their supposed peculiar effects, as wrongful conveyances [CONVEYANCES], than as simple means of transferring property. It has been usual to make corporations convey their own estates by feoffment, in consequence of the supposition that a corporate body cannot stand seised to a use, though it seems that this doctrine only applies to the case of lands being conveyed to a corporation to the use of others. (Gilb. *on Uses*, Sugd. Ed. 7 note.) Where the object to be attained was the destruction of contingent remainders or the discontinuance of an estate tail, or the acquirement of a fee for the purpose of levying a fine [FINE] or suffering a recovery [RECOVERY], a feoffment was usually employed. Such indeed was the efficacy attributed to this mode of conveyance by the earlier law writers, that where the feoffor was in possession, however unfounded his title might be, yet his feoffment passed a fee; voidable, it is true, by the rightful owner, but which by the lapse of time might become good even as against him. Being thus supposed to operate as a disseisin to the rightful owner, it was thought till recently that a person entitled to a term of years might by making a feoffment to a stranger pass a fee to him, and then by levying a fine acquire a title by non-claim. This doctrine led to very considerable discussion, and though strictly accordant to the principle of the old law, yet being alike repugnant to the principles of justice and to common sense, it has been overruled. In the progress of the discussion which ended in overturning the doctrine, arguments against its justice and expediency were used, rather than those founded upon the principles of law, and the bench even resorted to ridicule. Mr. Baron Graham in one case observed, 'Yet is this pretended possession of paper and packthread to be called by the tremendous name of disseisin.' The whole state of the question may be found in Mr. Knowler's celebrated argument in Taylor dem. Atkins *v.* Horde; 1 Burr. 60, Doe dem. Maddock *v.* Lynes, 3 B. & C. 382; Jerritt *v.* Wrace, 3 Price, 575; 1 Sand. *Uses*, 40 (4th ed.); 1 Prest. *Conv.* 32 (2nd ed.); and 4 Bythew. *Conv.* (Jarman's edit.), 117.

The owner of lands of gavelkind tenure [GAVELKIND] may convey them by feoffment at the age of 15; and therefore in such cases, which are necessarily rare, a feoffment is still resorted to. It is also frequently used for the sake of economy upon small purchases, in order to save the expense of a second deed, which is necessary where the conveyance is by lease and release.

FERÆ (Zoology), the third order of *Mammalia*, according to Linnæus. The following is his character of the order: upper incisor teeth (*primores*) six, rather acute (*acutiusculi*); canine teeth solitary. The order contains the following genera:—1. *Phoca* (the Seals); 2. *Canis* (the Dogs, Wolves, Foxes, Hyænas, and Jackals); 3. *Felis* (the Cats, Lions, Tigers, Leopards, Lynxes, and smaller cats); 4. *Viverra* (the Ichneumons, Coatis, Skunk (*Putorius*), Civets, and Genets); 5. *Mustela* (the Otters, Glutton, Martens, Pole-cats, Ferrets, and Weasels, including the Ermine, &c.); 6. *Ursus* (Bears, Badgers, and Racoons); 7. *Didelphis* (the Opossums); 8. *Talpa* (the Moles); 9. *Sorex* (the Shrews); 10. *Erinaceus* (the Hedge-hogs). Linnæus places the *Feræ* between the orders *Bruta* and *Glires*.

FERDINAND I. of Austria, younger brother of Charles V., born in 1503, was elected king of the Romans during his brother's reign, and succeeded him as emperor in consequence of the abdication of Charles, which was sanctioned by the diet of the empire in 1558. Ferdinand had married in 1521 Anna, daughter of Ladislaus VI., king of Bohemia and Hungary, and sister of Louis, who having succeeded his father in the crown of those realms, was killed in the disastrous battle of Mohacz by the Turks in 1526, and left no issue. Ferdinand, claiming a right to the succession in the name of his wife, the states of Bohemia acknowledged him, but in Hungary a strong party declared for John of Zapoli, palatine of Transylvania. This was the beginning of a long and desolating war, interrupted by occasional truces, in which Solyman, sultan of the Turks, interfered on behalf of John, and after John's death in 1540, on behalf of his son Sigismund, who continued to hold a part of Hungary till the death of Ferdinand. In Bohemia the religious disputes between the Calixtines, who were a remnant of the Hussites and the Roman Catholics, occasioned considerable uneasiness to Ferdinand, who found at last that it was his policy to tolerate the former. At the same time however he effected a thorough change in the institutions of that kingdom by declaring the crown of Bohemia hereditary in his family, without the sanction of the states. This gave rise to a confederacy which opposed Ferdinand by force of arms, but was at length overpowered and dissolved. On being proclaimed Emperor of Germany, after having signed certain conditions with the electors, which defined the boundaries of the imperial authority and gave security to the Protestant religion, Ferdinand notified his election to Pope Paul IV., expressing a desire to be crowned by his hands. Paul refused, under the plea that the abdication of Charles V. was effected without the consent of the papal see, and required a fresh election to be made. Ferdinand, indignant at these pretensions, ordered his ambassador to quit Rome. Paul however dying soon after, his successor, Pius IV., showed himself more tractable in acknowledging Ferdinand as head of the empire. It was then resolved by the electors, Protestant as well as Catholic, that in future no emperor should receive the crown from the hands of the pope, and that, instead of the customary form in which the emperor elect professed his obedience to the head of the church, a mere complimentary epistle should be substituted; and this was observed on the election of Maximilian, son of Ferdinand, as king of the Romans, a title which ensured his succession to the empire. Thus ended the last remains of that temporal dependence of the German empire on the see of Rome which had been the subject of so many controversies and wars.

Ferdinand continued throughout his reign to hold the balance even between the Protestants and Catholics with regard to their mutual toleration and outward harmony; he even endeavoured, though unsuccessfully, to effect a union of the two communions, by trying to persuade the Protestants to send deputies to and acknowledge the authority of the council assembled at Trent. This however they refused to do, unless their theologians were acknowledged as equal in dignity to the Roman Catholic bishops, and unless the council were transferred from Trent to some city of the empire. Ferdinand, on the other side, in order to conciliate some at least of the various dissenting sects in his own hereditary states, attempted to obtain of the pope, among other concessions, the use of the cup at the communion-table for the laity, and the liberty of marriage for the priests. Pius IV.

however, moderate as he was, would not listen to these two concessions, especially the latter, and the negotiations were still pending with regard to the former, when the emperor died at Vienna in July, 1564. He left three sons: 1, Maximilian, who succeeded him as emperor, archduke of Austria, and king of Bohemia and Hungary; 2, Ferdinand, whom he made count of Tyrol; 3, Charles, whom he appointed duke of Styria, Carinthia, and Carniola. Upon the whole, the administration of Ferdinand was able and enlightened; he maintained religious peace in Germany, he effected some useful reforms, and he saw the closing of the council of Trent. (Coxe, *History of the House of Austria*; Dunham, *History of the Germanic Empire*.)

FERDINAND II. of Austria, son of Charles, duke of Styria, and grandson of Ferdinand I., succeeded his cousin Matthias in 1619. But the states of Bohemia, who were already in open revolt against Matthias, both from political and religious grievances, refused to acknowledge Ferdinand, and declared the throne vacant. Count Thorn, who was at the head of the Bohemian insurgents, was joined by the dissidents of Moravia, Silesia, and Upper Austria, and Ferdinand found himself besieged within the walls of Vienna by the rebels, who threatened to put to death his ministers, as they had done with the governor of Prague and his secretary, whom they had hurled from the windows of the town-house, and to confine Ferdinand himself in a monastery, and educate his children in the Protestant faith. His friends however found means to raise the siege, and Ferdinand hastened to Germany to claim the imperial crown, having been acknowledged king of the Romans during the reign of his predecessor. He carried his election by means of the Catholic electors, who formed the majority. But the Bohemian states elected as their king Frederic, Count Palatine, son-in-law of James I. of England, and Hungary joined in the revolt, supported by Bethlehem Gabor, prince of Transylvania. This was the beginning of the Thirty Years' War, a war both religious and political, and one of the most desolating in the history of modern Europe. In the midst of these difficulties Ferdinand was ably supported by his general, Count de Tilly, who reconquered Bohemia and expelled Frederic. Hungary was soon after obliged to submit, and Bethlehem Gabor sued for peace. Another confederacy was formed against Ferdinand by the Protestant states of Saxony, supported by Christian IV. of Denmark, who put himself at their head in 1625. Ferdinand opposed to him Tilly and Waldstein, or Wallenstein, another commander of extraordinary abilities. In two campaigns the confederates were defeated, Christian was driven into his hereditary states, and the peace of Lubeck, 1629, put an end to the war. Ferdinand now adopted measures of retaliation which drove the Protestants to despair: he abolished the exercise of the Protestant religion in Bohemia; he exiled or put to death the leaders of that and other dissident communions; he confiscated their property; seven hundred noble families were proscribed, and the common people were forced to change their faith. Above 30,000 families, preferring their consciences to their country, sought refuge in Protestant states. Ferdinand intended to carry on the same sweeping measures throughout Germany, but here he adopted a more cautious plan. He began by dividing the Protestants or Lutherans from the Calvinists, and he called for the execution of a former act which allowed to the former only the free exercise of their religion, but condemned the Calvinists to apostacy or exile. He also insisted on the restitution of such ecclesiastical property as the Protestants had seized since the treaty of Passau in 1532. The Protestant princes were compelled in many cases to give up the lands and revenues which they had seized to the monastic and collegiate bodies, their former owners. But the Catholic princes prevented the entire execution of the decree. They had themselves, in the general confusion which followed the reformation, seized upon ecclesiastical property, which they did not wish to restore, and they moreover felt jealous of the threatening power of the house of Austria, allied as it was to the Spanish branch of the same house. They feared also that they might be made as completely dependent upon the emperor as the grandees of Spain had become upon their king. In this feeling they secretly encouraged their Protestant countrymen in resisting the further execution of the decree. The diet at Ratisbon, on Ferdinand's request that his son Maximilian might be elected king of the Romans, replied by insisting that the emperor should reduce his army and dismiss Waldstein, who had rendered himself hateful by the disorders of his troops. Soon afterwards Gustavus Adolphus landed in Pomerania, and put himself at the head of the Protestant party in Germany. The events of the memorable campaigns that followed are well known from Schiller's 'Thirty Years' War,' and other historians. [GUSTAVUS ADOLPHUS.] The Protestant cause triumphed in Germany until Gustavus fell at the battle of Lutzen, 1632, after which the Swedes and German Protestants continued the war; but the victory of Nordlingen, gained by Ferdinand, eldest son of the emperor, had the effect of detaching the elector of Saxony from the Swedes, an example followed by almost all the other German states. Ferdinand died in February, 1637, after having witnessed the election and coronation of his son Ferdinand as king of the Romans.

Ferdinand II. reigned in very troubled times; his bigotry and intolerance were the cause of most of his troubles, but he was not deficient in abilities or perseverance. His connivance at the assassination of his best general, Waldstein, whose ambition and arrogance had made him suspected and feared, is an everlasting blot on his memory.

FERDINAND III., son of Ferdinand II., had to continue the war against the Swedes, who had been joined by the French, for several years more, until the peace of Westphalia, 1648, put an end to the desolating struggle. This celebrated treaty forms an important epoch in the history of Germany and of Europe. The remainder of the reign of Ferdinand III. was passed in tranquillity. He died in 1657, leaving behind him the character of a wise, temperate, and a brave prince. He was succeeded by his son, Leopold I.

FERDINAND I. of Naples was the natural son of Alfonso V. of Aragon and of Sicily. His father obtained of the Neapolitan barons in parliament assembled, in 1442, the acknowledgment of Ferdinand, as duke of Calabria and heir to the crown of Naples, thus securing to his favourite and only son one of his several kingdoms, as Aragon, Sardinia, and Sicily devolved upon John of Aragon, Alfonso's brother. In 1458, after the death of his father, Ferdinand assumed the crown of Naples. Pope Calixtus III. refused him the investiture, which however was granted to him by Pius II., the successor of Calixtus. His reign began well, but a conspiracy of the barons, who called in John of Anjou, who had some remote claim to the throne, threw the country into a civil war. Ferdinand, assisted by Scanderbeg, prince of Albania, gave battle to John near Troja in Apulia and defeated him completely, in the year 1462. After the battle he concluded a peace with the revolted barons upon conciliatory terms, but in a short time, breaking the treaty, he put to death two of them, an act which kept alive the jealousy and fears of the rest. In 1480 Mohammed II. sent an armament on the coast of Apulia, which took the town of Otranto and caused great alarm in all Italy. Ferdinand, however, quickly recalled his son Alfonso, duke of Calabria, who was then in Tuscany at the head of an army, and who retook Otranto. A fresh conspiracy of the barons broke out, encouraged by Pope Innocent VIII., but it was again repressed, and Ferdinand solemnly promised a general amnesty. But he kept his word no better than before, for having contrived, on the occasion of the marriage of his niece, to collect at Naples most of the leading barons, he arrested them all, and threw them into prison, where most of them were strangled. The whole of this tragedy, which was attended by circumstances of fearful treachery and cruelty, is eloquently related by Porzio in his work, *La Congiura dei Baroni contra il Rè Ferdinando I.* Ferdinand continued to reign for several years after this, feared and hated by his subjects, and himself in perpetual anxiety, which was increased by the advance of Charles VIII. of France, who was coming for the purpose of asserting his claims, derived from the Anjous, to the throne of Naples. In the midst of the alarm at the approaching storm, which he had not the means of averting, Ferdinand died in 1494, at the age of 71. He was succeeded by his son Alfonso, a gloomy and cruel prince, who, terrified at the approach of the French, abdicated in favour of his son Ferdinand, and retired to a convent in Sicily.

FERDINAND II. was very young when he found himself occupying a throne threatened by enemies from without and by disaffection from within. He endeavoured to rally his troops against the French, but being forsaken by all, he withdrew to Sicily with his uncle Frederic. The French

occupied Naples, where their conduct soon disgusted the Neapolitans, while the other states of Italy formed a league against them in the North. Ferdinand seized the opportunity to ask assistance from Ferdinand V. of Spain, who sent him his great Captain Gonzalo of Cordova with a body of troops, who soon reconquered the kingdom of Naples. Ferdinand returned in triumph to his capital, but did not long enjoy his prosperity; he died suddenly in 1496, at the age of 28 years, regretted by his subjects, who had formed great hopes of him from his amiable qualities and abilities. He was succeeded by his uncle Frederic, who was soon after treacherously deprived of his kingdom by his pretended ally, Ferdinand of Spain.

FERDINAND III. of Naples is the same as FERDINAND V. OF SPAIN.

FERDINAND IV. of Naples, afterwards styled Ferdinand I. of the United Kingdom of the Two Sicilies, born in January 1751, was the son of Don Carlos of Bourbon, king of the Two Sicilies, afterwards Charles III. of Spain. The life of Ferdinand is remarkable, not so much on account of his personal character, as from the uncommon length of his reign and its many vicissitudes being closely connected with all the great events of Europe during the last half century, as well as the singular good fortune which attended him to the end of his life with little or no exertion on his part. The education of Ferdinand was greatly neglected. He was little more than eight years of age when his father Charles, being called to the throne of Spain by the death of his brother Ferdinand VI., made over to him the kingdom of Naples and Sicily, appointing a council of regency, at the head of which he placed the Marquis Tanucci, an able minister, who however does not seem to have been very anxious about the instruction of his young sovereign. In April 1768, Ferdinand, being now of age, married Maria Carolina of Austria, daughter of Maria Theresa, a princess accomplished, clever, and ambitious, who in fact ruled under her husband's name till her death, assisted by the various ministers who succeeded each other at the helm of affairs, the king himself being generally passive, and his time being much engrossed by hunting, shooting, and other diversions. Yet Ferdinand was by no means deficient in good sense or natural penetration; he often saw things more clearly than those around him, which is manifest from many of his shrewd though blunt remarks which are still remembered at Naples; but his want of instruction, of which he was aware, and his dislike of application, prevented him from exerting or enforcing his own judgment. The first 30 years of his reign, those of the regency included, were for Naples years of peace and comparative happiness; many useful reforms were effected by his ministers, and especially by Tanucci, who continued at the head of affairs till 1777. A detailed account of these reforms, in the various departments of public education, ecclesiastical discipline, feudal jurisdictions, financial economy, and the administration of justice, is given by Colletta, in his able and impartial 'Storia del Reame di Napoli,' 1834, and also by Count Orloff in the 2nd volume of his 'Mémoires sur le Royaume de Naples.' Ferdinand was very popular, especially with the lower classes; and as he was the first king born at Naples for centuries past, they called him emphatically 'our king.'

Tanucci being dismissed in 1777 for having objected to the queen taking her seat in the council of state, Caracciolo and others followed for a short time, until John Acton, an Englishman, and a naval officer in the service of Leopold of Tuscany, was sent for to organize the Neapolitan navy and army, which had fallen into decline during a long season of peace. The advancement of Acton was extremely rapid; he was made general, then captain-general of the kingdom, and lastly premier, or rather sole minister (for the other ministers were merely his creatures), and in this office he remained for many years. His administration was neither so economical nor so wise as that of Tanucci. Things went on however quietly and smoothly for several years, yet a considerable degree of liberty of speech, and even of the press, prevailed at Naples, and the country was prosperous and the people contented until the breaking out of the French revolution, of which Naples, however remote, felt the shock. The queen being the sister of Marie Antoinette, was indignant at the treatment her relatives of France met with at the hands of the revolutionists; and as many young men at Naples, mostly belonging to the higher ranks of society, seemed to approve of the principles of the revolution, the court took alarm, and the men who had always been averse to reform and improvement seized the opportunity to regain the ascendancy. This was an epoch of a re-action in the internal politics of Naples. Arrests were made, and a giunta, or state tribunal, was formed to try the real or pretended conspirators, three of whom were sentenced to death, others to perpetual imprisonment, but the majority (against whom the judges, notwithstanding all the exertions of the attorney-general, Vanni, could find no evidence), were acquitted after four years' confinement.

The court of Naples had joined the first coalition against France in 1792, and had sent some troops to join the Austrians in the North of Italy, and others with a squadron to the expedition against Toulon. In 1796, however, alarmed by the successes of Bonaparte, a peace was concluded with the Directory by paying a few millions of francs. In 1798, the French having occupied the papal state, the court of Naples formed a secret alliance with Austria, England, and Russia, but, instead of waiting for the opening of the campaign in Lombardy, which was to take place in the following spring, the Neapolitan army, 60,000 strong, began hostilities in November, 1798, and marched upon Rome, which it occupied only for a few days, as the French generals, having collected their forces, attacked and routed several divisions of the Neapolitans, and cut off the communications between the rest; a general panic spread through the army; the king, who had accompanied it as far as Rome, fled back to Naples; Mack, who was his commander-in-chief, followed his example; and of the various corps that were left to themselves without any concerted plan or preparations in case of a reverse, some were dispersed or made prisoners, and others made good their retreat to their own frontiers, whither the French followed them closely. The greatest confusion prevailed at the court of Naples; the queen, beset by informers, fancied that the capital was full of conspirators, and determined to withdraw to Sicily. Ferdinand was easily persuaded to do the same, and the royal family left Naples on the 21st of December, 1798. The French meantime were approaching, and the populace, left without a government and excited by denunciations against the Jacobins, rose, murdered a number of persons, and for three days fought desperately against the advancing French in the streets of the capital. The events of Naples in 1799 form a romantic but most tragical episode in the history of the Continental war, and they have become the theme of numerous narratives. The best accounts are given by Colleta, already mentioned, by Cuoco, 'Saggio Storia sulla Rivoluzione di Napoli,' and in a work called 'Sketch of Popular Tumults,', London, 1837. The reverses of the French in Lombardy in the spring of 1799, obliged them to abandon Naples, leaving only a small garrison in it. The native republicans, or patriots as they were called, were few, and disliked by the lower classes. Cardinal Ruffo landed in Calabria from Sicily, and preached a sort of political and religious crusade against the French and their partisans, and the whole kingdom was re-conquered for Ferdinand in a short time. A dreadful re-action took place, in which thousands lost their lives, either murdered by the royalists, or condemned by the courts instituted to try all those who were accused of republicanism.

Ferdinand returned to Naples, and in 1801 he concluded, through the mediation of Russia, a treaty of peace with France. But the past events and the proscriptions that had taken place in his name had destroyed all confidence between the government and the more enlightened part of the nation. In 1805 the court of Naples committed a second political error, worse than that of 1798. While professing to be at peace with France, it entered secretly into the coalition against that power; and while Napoleon was defeating the Austrians on the Danube, Russian and English troops were landed at Naples to join the army of that kingdom for the avowed purpose of attacking the French in the north of Italy. The consequence was, that Napoleon, after his victory at Austerlitz, declared that 'the Bourbon dynasty had ceased to reign at Naples,' and he sent a force under Massena to occupy that kingdom. Ferdinand and his court withdrew to Sicily a second time, where, being protected by the English forces, they remained till 1815. A desultory but cruel warfare was carried on for several years in Calabria between the partisans of Ferdinand and those of Murat, whom Napoleon had made king of Naples, the details of which are vividly described by Botta, 'Storia d' Italia,' 24th book, towards the end. But even in Sicily the reign of Ferdinand did not run smooth. The court was

extravagant in its expenditure, the queen was as arbitrary as ever, and great jealousy existed between the Sicilians and the Neapolitan courtiers and emigrants. But Sicily had a parliament consisting of three orders, barons, clergy, and deputies of the towns, and the parliament would not sanction the levying of fresh taxes. The queen then ordered the imprisonment of five of the most influential barons. Meantime it was suspected that that princess, who had conceived a dislike against the English, whom she considered as a check upon her, entertained secret communications with Napoleon, who in 1810 had married her grand-niece, Maria Louisa. A conspiracy against the English was discovered at Messina. All these circumstances obliged the English government to interfere, and in January, 1812, Ferdinand resigned his authority into the hands of his eldest son, Francis. A parliament was assembled, which abolished feudality, and framed a new constitution upon a liberal basis. The queen's influence was now at an end, and after some fruitless intrigues she embarked in 1813 for Constantinople, from whence she went to Vienna, where she died in the following year. For an account of these important Sicilian transactions see Botta, and also a work styled *De la Sicile et de ses Rapports avec l'Angleterre à l'époque de la Constitution de* 1812, Paris, 1827. In 1814 Ferdinand resumed the reins of government, and opened in person the Sicilian parliament of that year. In 1815, after the defeat of Joachim Murat by the Austrians, Ferdinand was recalled to the throne of Naples, and in June of that year he returned to his old capital. In a well written proclamation to the Neapolitans he promised them peace, a complete forgetfulness of the past, impartial justice, and a steady administration. And now that he for the first time acted by himself, he kept his word. The government of Ferdinand at Naples from 1815 till 1820 was mild, impartial, and orderly. This is attested by Colletta, a liberal writer, b. viii. sec. 50, of his History. But in Sicily, having dissolved the parliament, he never convoked it afterwards. By a decree of December, 1816, he assumed the title of Ferdinand I., King of the United Kingdom of the Two Sicilies, declaring that Sicily and Naples formed no longer distinct states, but were both subject to the same system of government.

Meantime a secret society, called Carbonari, were spreading themselves fast through the kingdom, especially among the landed proprietors in the provinces, and consequently through the ranks of the provincial militia. The land-tax, which was more than 20 per cent. on the rent, made this class of people dissatisfied and ready for change. The origin of this society or sect, for it was religious as well as political, is somewhat obscure: it seems to have come from France into Italy, and was established in the kingdom of Naples under Murat, with his sanction; but was afterwards proscribed by him, and it then found favour with the court of Sicily. (*Memoirs of Secret Societies of the South of Italy*, London, 1821. See also Botta, book xxiv., and Colletta, book viii.) Colletta thus describes its tendency: 'The Carbonari spread among the minor orders of society, who, rallying round the principle of civil equality, move forward in a body pressing upon the higher orders; an impulse which in a virtuous and moral community tends to establish democratic institutions, but which in our own corrupt and profligate state of society tends only to a change of matters under the forms and the language of democracy.

On the 2nd of July, 1820, a military revolt, led by two subalterns, broke out in a regiment of cavalry stationed near Naples; other troops joined in it, and the Carbonari of the capital and provinces openly espoused its cause, demanding a representative constitution for the kingdom. Ferdinand, pressed by his ministers, promised to establish a constitution in a given time; but the Carbonari would not wait, saying it was better to adopt one already made, namely, that of the Cortes of Spain, and thus the Spanish constitution was proclaimed, and a parliament was convoked at Naples. Meantime the Sicilians, ever jealous of their nationality, demanded a separate parliament for themselves and a repeal of the union of the two kingdoms, which the parliament at Naples refusing, a revolt broke out at Palermo, which was put down after much bloodshed. Soon after, the sovereigns of Austria, Russia, and Prussia, assembled at Troppau, wrote to King Ferdinand, inviting him to a conference at Laybach, in Carinthia, without which they stated that they could not acknowledge the new system of government established at Naples. Ferdinand, after some demur, obtained leave of the parliament to proceed to the congress in December, 1820, leaving his son Francis as his vicegerent at Naples. In February, 1821, Ferdinand, by a letter written from Laybach, signified to his son that the allied sovereigns were determined not to acknowledge the actual constitutional government as established at Naples, deeming it incompatible with the peace of that country and the security of the neighbouring states; but that they wished Ferdinand himself, assisted by the wisest and most able among his subjects, to give to his kingdom institutions calculated to secure peace and prosperity to the country. Soon afterwards the Austrian army passed the Po, moving on towards Naples. The parliament of Naples determined upon resistance, but at the first encounter, near Rieti, a Neapolitan division was defeated, and the rest of the army being alarmed at the thought of fighting against the will of their own king, disbanded, and the Austrians entered Naples without any further opposition at the end of March, 1821. Ferdinand soon afterwards returned to his capital on what may be styled his third restoration. The leading constitutionalists were allowed to emigrate; but of those who remained some were tried and sent to the Presidii. The government again became absolute, but not so lenient or liberal as it was before 1820. After reigning four years longer, Ferdinand died suddenly on the morning of the 4th of January, 1825, aged seventy-six, having been king sixty-five years. He was succeeded by his son, Francis I.

FERDINAND, or FERNANDO I., styled the Great, the son of Sancho, called Mayor, king of Navarra and Castile, succeeded his father in 1035, and having defeated and killed Veremund, king of Leon, in 1038, succeeded him as king of Leon and of Asturias. Navarra became the appanage of Ferdinand's brother Garcia. Ferdinand, called the Great, made war against the Moors, whom he drove away from the northern part of Portugal as far as the Mondego. He died in 1065, leaving three sons, Sanctius, to whom he gave Castile; Alfonso, who had Leon; and Garcia, who retained Gallicia.

FERDINAND II., second son of Alonso VIII. of Castile and Leon, succeeded his father in the latter kingdom only in 1157. He was engaged in wars with Alfonso Henrique, king of Portugal, and also with his own nephew, Alonso of Castile. He died in 1187.

FERDINAND III., called the Saint, son of Alonso IX., king of Leon and of Berengaria of Castile, inherited both crowns after the death of his parents. Ferdinand was successful in his wars against the Moors beyond any of his predecessors: he took from them Badajoz and Merida in 1230, Cordova in 1236, and Jaen, Seville, and Murcia in 1243. He was making preparations for carrying the war into Africa when he died, in 1252. Ferdinand collected the laws of his predecessors into a code; he established the council of Castile; he cleared his states from robbers, and checked the arbitrary acts of the nobles. He was one of the most illustrious sovereigns of the old Spanish monarchy. His son Alonso X., called 'the Wise,' succeeded him on the throne.

FERDINAND IV. succeeded his father, Sancho IV., in 1295, while yet a minor. His reign was engrossed chiefly by wars with the Moors; he died in 1312, and was succeeded by his son Alonso XI.

FERDINAND V. of Castile and II. of Aragon, son of John II. of Aragon, married in 1469 Isabella, daughter of John II. of Castile, and heiress to that crown, by whom he had several daughters, one of whom married Emmanuel, king of Portugal; another, Catherine, was married to Henry VIII. of England, and the other, Joanna, married Philip, archduke of Austria, son of the emperor Maximilian I. Ferdinand succeeded to the crowns of Aragon and of Sicily by the death of his father, and his wife Isabella had already succeeded in her own right, and with the sanction of the Cortes, to the throne of Castile by the death of her brother, Henry IV., in 1472. Thus were the two great divisions of Spain united, though the two kingdoms remained under separate administrations, Castile was still governed in the name of the queen until the death of Isabella in 1504, followed by that of the archduke Philip in 1506, when Ferdinand, owing to the insanity of his daughter Joanna, assumed the government of Castile, which he retained till his death, when his grandson, Charles V., succeeded to the whole splendid inheritance.

Ferdinand took from the Moors the kingdom of Gra-

nada, their last possession in Spain, in 1492, after a war of several years; at the same time Columbus was discovering for him the new world, where the Spaniards soon after made immense conquests. Ferdinand's general, Gonzalo of Cordova, conquered for him the kingdom of Naples, partly by force, and partly by treachery. By similar means Ferdinand conquered Navarra, which he added to his other dominions. He was the most powerful monarch of his time, and was also the cleverest; but his abilities were disgraced by a total want of faith, and a recklessness of principle of which he made no scruple of boasting. He was styled the Catholic, a title which the kings of Spain have continued to assume ever since, in consequence of his having cleared the soil of Spain of the Mohammedans. He was also called the Prudent, and the Wise. He was ably assisted by his minister, Ximenes [CISNEROS], who emancipated the crown from the power of the feudal nobles by raising troops at the expense of the state, and by favouring the privileges of the municipal towns. Ferdinand established the Inquisition in Spain, which fearful tribunal continued till 1820, when it was finally abolished. Acting from the same intolerant principle he drove away the Jews from Spain; but he also established a severe system of police throughout his dominions by means of the association called the Santa Hermandad, which did summary justice upon all offenders without distinction of ranks. He also forbade any papal bull to be promulgated without the previous sanction of the royal council. He may be considered as the restorer, if not the founder, of the Spanish monarchy. Ferdinand died in January, 1516, at sixty-three years of age.

FERDINAND VI., eldest son of Philip V. of Bourbon, king of Spain, succeeded his father in 1746. He made several useful reforms in the administration, and gave encouragement to commerce and manufactures. He had the character of a good and wise prince, willing to administer impartial justice, and willing to redress the grievances of his subjects. He died without issue in August, 1759, and was succeeded by his brother Don Carlos, king of the Two Sicilies, who assumed the title of Charles III. of Spain, and continued the same laudable system as his predecessor.

FERDINAND VII., eldest son of Charles IV., king of Spain, and of Maria Louisa of Parma, was born on the 14th of October, 1784. When six years of age, he was proclaimed prince of Asturias. At that time Godoy, afterwards called the Prince of Peace, was the favourite minister and ruler at the Spanish court. Both he and the queen kept young Ferdinand, who was of a sickly constitution, in a state of thraldom and seclusion little suited to the heir apparent of the throne. He had however some well-informed preceptors; among others the canon Escoiquiz, who figured afterwards in the political events of his reign. In 1802 Ferdinand married his first cousin, Maria Antonietta, daughter of Ferdinand IV., king of the Two Sicilies, a princess of a superior mind, who endeavoured to restore her husband to his proper sphere and influence at court: in attempting which she drew upon herself the dislike of the queen and of the favourite, and from that time both she and her husband were kept in a state of retirement and humiliation. She died suddenly in May, 1806, under suspicious circumstances, and left no issue.

In the mean time the administration of Spain was in a wretched state; every thing was done through bribery or favour; the monarchy was sinking lower and lower in the estimation of Europe, having become a mere dependent of France, and the people were highly dissatisfied. Some friends of Ferdinand, and among others his preceptor Escoiquiz, formed a plan for overthrowing the favourite Godoy. Being in want of powerful support, they unwarily advised Ferdinand to address himself to the Emperor Napoleon, to whom the prince wrote a letter, dated 11th of October, 1807, in which he complained of Godoy's influence and the state of thraldom in which both the king his father and himself were kept, and expressed a desire to form a connexion with a princess of Napoleon's family, and to place himself under his protection. A memorial was at the same time penned by Escoiquiz, and copied by Ferdinand with his own hand, pointing out in vivid language the mal-administration of the kingdom, and asking, as the first remedy, the dismissal of the favourite. Ferdinand was to have read this memorial to the king his father, but Godoy being apprised of the plot, hastened to Charles, and told him that his son was conspiring both against his crown and his life. Upon this Ferdinand was arrested, his papers were seized, and after some days of close confinement he was frightened into an acknowledgment of what he really was not guilty of—a conspiracy to dethrone his own father. This scandalous affair caused great excitement in the country, and the people in general, who disliked Godoy, took the part of the young prince, who from his infancy had been the victim of court intrigues. Meanwhile French troops had entered Spain under the pretence of marching against Portugal—had taken possession by surprise of several fortresses, and Napoleon's further intentions becoming more alarming, the court decided upon abandoning Spain and retiring to Mexico. The 17th of March, 1808, was fixed for the departure, when a revolt broke out among the guards at Aranjuez, and Godoy was in danger of his life; but Ferdinand himself came to rescue him from the hands of the mutineers, saying that he would answer for his appearance before the proper court. King Charles being alarmed for his own safety, and perceiving the popularity of his son, abdicated on the 19th of March in favour of Ferdinand, who assumed the title of king of Spain and the Indies. But this did not suit Napoleon, who contrived under specious pretexts to draw both father and son to Bayonne, and there obliged them both to resign in his favour. Ferdinand and his brother Don Carlos were sent to Talleyrand's country residence at Valençay, where they were treated with outward marks of respect, but kept under a strict watch. There Ferdinand remained passive and resigned till the end of 1813, when the reverses of the French both in Spain and in Germany induced Napoleon to restore Ferdinand to the throne of Spain, on condition that he should send the English out of the peninsula, who were, as Napoleon said, spreading anarchy and jacobinism in the country. A treaty to that effect was signed at Valençay between the two parties, but the Cortes of Madrid refused to ratify it, and wrote to Ferdinand that they would receive him in his capital as their lawful king, provided he would sign the constitution which had been proclaimed at Cadiz in 1812 by the representatives of the nation. [CORTES, and references therein.] Ferdinand set off from Valençay in March, 1814, and it was only on the road that he read for the first time a copy of the new constitution, having been kept in ignorance till then of the proceedings of the Cortes, except what he had read in the garbled accounts of the French newspapers. On arriving at the frontiers of Spain, instead of proceeding direct to Madrid, he went to Zaragoza, and thence to Valencia, where he was surrounded by a host of people, military and civilians, churchmen and laymen, who were hostile to the constitution, and who advised him to reign, as his fathers had done before him, an absolute king. The lower classes, excited by the clergy, and especially by the friars, were loud in their denunciations of the constitution, which they called heretical, and Ferdinand easily persuading himself that the constitution was unpopular, determined not to sanction it. At Valencia he appointed a ministry from among the serviles, or absolutists; and on the 4th of May, 1814, he issued a decree annulling the constitution and all the enactments of the Cortes made in his absence. Soon afterwards he made his entrance into Madrid among the acclamations of the populace and of the absolutists, or clergy party; an event which was speedily followed by a violent proscription of the constitutionalists, or liberals, as they were styled, including the members of the Cortes. As the British ambassador had obtained from Ferdinand at Valencia a promise that the punishment of death should not be inflicted for past political conduct, the courts appointed to try the leading constitutionalists resorted to every kind of subterfuge in order to find them guilty of some imprudent demonstration or expression since the king's return, and sentences of imprisonment, exile, banishment to the presidios in Africa, and confiscation, were freely awarded. The military insurrections of Porlier, Lacy, and others, came to add fresh fuel to the spirit of persecution. All the abuses of the old administrative and judicial system now re-appeared; the finances were in a wretched state, the American colonies were in open revolt, and Ferdinand was either kept in ignorance of the true state of things, or his natural indecision of character prevented him from altering his policy. He was overawed by the clergy and absolutist party, who, at that time, seemed to have on their side the great mass of the population, and he feared and hated the liberals, whom he looked upon as the enemies of his throne.

On the 1st of January, 1820, part of the troops stationed

in the Isle of Leon, near Cadiz, under colonels Quiroga and Riego, proclaimed the constitution of 1812; the example was followed by other garrisons; the Ministers at Madrid hesitated, and Ferdinand, on the 8th of March of that year, swore his adherence to the constitution. The Cortes were assembled, and the deputies and other liberals, who had been exiled or imprisoned, re-appeared on the political stage. The events of the following three years are matters of contemporary history, upon which it is difficult as yet to pronounce a final judgment. Errors were committed by all parties. At one time Ferdinand appeared reconciled to the constitutional system, but now and then some fresh insult or other act of violence of the more zealous liberals came to rouse his old fears and antipathies; whilst, on the other side, the partisans of absolutism, who still lingered near the king's person, kept alive by their intrigues the mistrust even of the moderate constitutionalists. Of this period of Ferdinand's reign there is a pretty accurate sketch in a work written by a Spanish emigrant at Paris, styled '*Revolution d'Espagne, Examen Critique*, 8vo., 1836.

At the beginning of 1823 Louis XVIII. declared to the French chambers that he was going to send his nephew, the duke of Angoulême, with an army of 100,000 Frenchmen into Spain to deliver Ferdinand VII. from the slavery in which he was kept by a factious party, and to restore him to his freedom of action. The English ministry protested against this interference, and the Cortes of Spain, on their side, rejected the mediation of the northern courts, who, to prevent the entrance of the French, required certain modifications in the constitution of 1812. The Cortes, on the 20th March, removed to Seville, where the king was induced to follow them. On the 7th April the French entered Spain, with little or no opposition, and on the 23rd they entered Madrid, where they were received with acclamations by the clergy and the lower classes, while the grandees or high nobility presented a congratulatory address to the duke of Angoulême. The Cortes, not judging themselves safe at Seville, removed to Cadiz, and, as Ferdinand refused to quit Seville, they passed a resolution, after a stormy debate on the 11th June, declaring the king in a state of incapacity, and appointing a regency *pro tempore*. Ferdinand was then compelled to set off with his family on the evening of the 12th, under a strong escort, for Cadiz, where he arrived on the 15th. In the following September the French besieged Cadiz, and after some negotiations Ferdinand was allowed by the Cortes to repair to the French camp to treat with the Duke of Angoulême. Before leaving Cadiz Ferdinand published a proclamation on the 30th September, in which he promised a general amnesty for the past; he acknowledged all the debts and obligations contracted by the constitutional government, and 'declared of his own free and spontaneous will that if it should be found necessary to make alterations in the actual political institutions, he would adopt a system of government which should guarantee the security of persons and property and the civil liberty of the Spaniards.' None of these solemn promises were kept. The liberals were persecuted worse than before, the debts contracted under the Cortes were disavowed, and the old system of absolutism with all its maladministrations was resumed. The sequel is well known. Ferdinand continued to govern, at least nominally, checked on one side by fear of the liberals, and on the other by mistrust of the more violent absolutists, or apostolical party as it was called, who found Ferdinand too moderate for them, and who would have re-established the Inquisition, and ruled Spain by terror. In his latter years Ferdinand seemed to take little or no interest in public affairs, leaving things to go on as they could. Having lost his third wife, who was a Saxon princess, and having yet no children, he married in November, 1829, Maria Christina, daughter of Francis, king of the Two Sicilies, and his own niece by her mother's side. By her he had two daughters—Maria Isabella, now queen of Spain, born 10th October, 1830, and Maria Louisa Ferdinanda, born 1832. Ferdinand died on the 29th September, 1833, after being long in a bad state of health, at the age of 49 years. He was buried with great pomp in the royal vaults under the chapel of the Escurial.

Accounts more or less accurate of the various periods of his reign may be gathered from the numerous contemporary public documents and journals, and also from the following works:—*Memoirs of Ferdinand VII. king of Spain, translated from the Spanish original MS.* by M. J. Quin, London, 1824; Toreno, *Historia del Levantamiento, Guerra y Revolucion de España*: Inglis's *Spain in 1830*; and a very interesting article *on Spanish Affairs* in No. 1 of Cochrane's *Foreign Quarterly Review*, March, 1835, from which something like a correct estimate of Ferdinand's character may be formed.

FERDUSI. [FIRDOUSI.]

FERGUSON, JAMES, was born in 1710, at a short distance from Keith, a village in Banffshire. His father, who was a day-labourer, taught him to read and write, and sent him to school for three months at Keith.

When only seven or eight years old, having seen his father use a beam as a lever, with a prop for a fulcrum, in order to raise the roof of their cottage, which had partly fallen in, his curiosity was so much excited by the ease with which what appeared to him so stupendous an effect was accomplished, that he thought about it, and made trials, and constructed models, and drew diagrams, till he became acquainted with the chief properties of the lever, not only in its simple application, but as modified by the wheel and axle. The taste for practical mechanics thus formed continued to distinguish him through life, and, together with an equally decided taste for astronomy, conducted him in his later years to distinction and independence.

His astronomical pursuits commenced soon afterwards. His father sent him to a neighbouring farmer, who employed him in watching his sheep. While thus occupied, he amused himself at night in studying the stars, and during the day in making models of mills, spinning-wheels, and similar things. When a little older, he entered into the service of another farmer, who treated him with great kindness, and encouraged and assisted him in his astronomical studies. 'I used,' he says, 'to stretch a thread with small beads on it at arm's length between my eye and the stars, sliding the beads upon it till they hid such and such stars from my eye, in order to take their apparent distances from one another; and then laying the thread down on a paper, I marked the stars thereon by the beads.' 'My master,' he adds, 'that I might make fair copies in the day-time of what I had done in the night, often worked for me himself.' Mr. Gilchrist, the minister of Keith, having seen his drawings, gave him a map of the earth to copy, and furnished him with compasses, ruler, pens, ink, and paper.

At the house of Mr. Gilchrist he met Mr. Grant of Achoynaney, with whom, at the termination of his engagement with his present master, he went to reside, being then in his twentieth year. He had learnt vulgar arithmetic from books, and Mr. Grant's butler, Mr. Cantley, taught him decimal arithmetic and the elements of algebra, and was about to commence instructing him in geometry when he left the employment of that gentleman.

Ferguson soon afterwards entered into the service of a miller in the neighbourhood, where he was overworked, and scarcely supplied with food enough for subsistence. After remaining a year in this situation, he was engaged by Dr. Young, who was a farmer as well as a physician, and who promised to instruct him in medicine, but broke his promise, and treated him with so much harshness, that, though his engagement was for half a year, he left at the quarter, and forfeited the wages which were due to him. A severe hurt of the arm and hand, which he had got in the doctor's service, confined him to his bed for two months after his return home. During this time he amused himself with constructing a wooden clock. He afterwards made a wooden watch with a whalebone spring; and his talents having been turned in this direction, he began to earn a little money in the neighbourhood by cleaning and mending clocks.

He was about this time invited to reside with Sir James Dunbar of Durn, and, at the suggestion of Lady Dipple, Sir James's sister, began to draw patterns for ladies' dresses. He says, 'I was sent for by other ladies in the country, and began to think myself growing rich by the money I got by such drawings; out of which I had the pleasure of occasionally supplying the wants of my poor father.' His studies in astronomy however were not neglected, and he still continued to use his thread and beads.

Besides drawing patterns, he copied pictures and prints with pen and ink; and having left the residence of Sir James Dunbar for that of Mr. Baird of Auchmeddan, Lady Dipple's son-in-law, he drew a portrait of the gentleman, which was much admired, and now be Silces and likenesses from the life in Indian ink: the mountain to his patrons to be so excellent, that the the highest Edinburgh with the intention of havi is distinguished Vo ock, caverns, and

instructed in drawing, but a premium having been unexpectedly demanded, he boldly commenced the practice of his art at once. The Marchioness of Douglas having assisted him with her patronage, he succeeded so well, that he obtained money enough not only to defray his own expenses, but to contribute largely to the support of his aged parents.

Though he continued to follow this profession for about twenty-six years, he seems never to have given his mind to it; and indeed, after having been two years in Edinburgh, he returned to the country with a supply of drugs with the intention of practising medicine, but soon found himself to be totally unqualified for his new occupation. He then went to Inverness, where he remained about three months. While there he drew an Astronomical Rotula, for exhibiting the eclipses of the sun and moon, which he transmitted to Professor Maclaurin at Edinburgh, who was highly pleased with it. He now returned to Edinburgh, and the Professor had the Rotula engraved, and it ran through several impressions, till, by the change of the style in 1753, it became useless. While at Edinburgh he made a wooden orrery, and delivered a lecture on it before the mathematical class.

In 1743 he resolved to go to London, where he continued his profession of drawing portraits, but devoted his leisure to astronomical pursuits.

In 1747 he published his first work, 'A Dissertation on the Phenomena of the Harvest Moon,' having been previously introduced at one of the sittings of the Royal Society by Mr. Folkes the president.

In 1748 he read lectures on the eclipse of the sun which happened in that year. From this period he began, under the patronage of the prince of Wales, afterwards George III., to deliver lectures on astronomy and mechanics: they were numerously and fashionably attended, and he now relinquished his former profession altogether. From this time to the end of his life he continued his lectures, and wrote several works on astronomy and mechanics.

Soon after the accession of Geo. III. a pension of 50*l.* a year was granted him out of the privy purse. In 1763 he was elected a Fellow of the Royal Society, and in 1770 was chosen a member of the American Philosophical Society.

He died in 1776, aged 66, leaving an only son, to whom he bequeathed a considerable sum acquired by his lectures and his writings.

Ferguson has contributed more than perhaps any other man in this country to the extension of physical science among all classes of society, but especially among that largest class whose circumstances preclude them from a regular course of scientific instruction. Perspicuity in the selection and arrangement of his facts and in the display of the truths deduced from them was his characteristic both as a lecturer and a writer.

The following are his principal works: 'Astronomy explained upon Sir Isaac Newton's Principles, and made easy to those who have not studied Mathematics,' 4to. 1756. There have been many editions of th , work; one by Dr. Brewster, 2 vols. 8vo. 1811, containing the new discoveries since the time of Ferguson. 'Lectures on Subjects in Mechanics, Hydrostatics, Pneumatics, and Optics, with the Use of the Globes, the Art of Dialling, and the Calculation of the Mean Times of New and Full Moons and Eclipses,' 8vo. 1760; 4to. 1764. An edition of this work by Dr. Brewster was published in 1805, and another in 1806. 'An Easy Introduction to Astronomy for Young Gentlemen and Ladies,' 1769. 'Introduction to Electricity,' 8vo. 1770. 'The Art of Drawing in Perspective made easy to those who have no previous knowledge of Mathematics,' 8vo. 1775: this was his last work. Besides other works not mentioned here, he contributed several papers to the Philosophical Transactions.

(*Life* by himself, prefixed to his 'Select Mechanical Exercises;' Nichols's *Anecdotes*; *Pursuit of Knowledge under Difficulties*, vol. i., in 'Library of Entertaining Knowledge.')

FERGUSON, ADAM, born in 1724, was the son of a parish minister in Perthshire. He studied at St. Andrews and at Edinburgh. On being ordained, he was appointed chaplain to the 42nd, a Highland regiment, in which he remained till 1757, when he retired and was appointed keeper of the advocates' library of Edinburgh. In 1759 [illegible] professor of natural philosophy in the college and in 1764 he was appointed to the chair of [illegible]ophy, a branch of science to which he had [illegible] applied himself. In 1767 he published [illegible] History of Civil Society,' a work which was well received, and which procured him the notice of public men. It was reprinted several times, and translated into French, German, and other languages. In 1774 he accompanied the young Earl of Chesterfield on his travels, but remained with him only a twelvemonth. In 1776 he wrote 'Remarks on a Pamphlet of Dr. Price, entitled Observations on the Nature of Civil Liberty.' In 1778 he was appointed secretary to the commissioners who were sent to America in order to try to effect a reconciliation with the mother country, an office in which Ferguson took a clearer view of the state of the question and of the temper of the American people, than was common at that time with Englishmen. On his return in 1779 he resumed the duties of his professorship, and in 1783 he published his 'History of the Progress and the Termination of the Roman Republic,' 3 vols. 4to. This work, which has been reprinted several times, and by which Ferguson is most generally known, is not so much a regular narrative of the events of Roman history, as a commentary on that history; its object is to elucidate the progress and changes of the internal policy of the Roman commonwealth, the successive conditions of its social state, as well as the progress of the military system of the Romans, and the varied but studied course of their external policy towards foreign nations. He carries his work down to the end of the reign of Tiberius, when all remains of the old institutions may be said to have become effaced. Ferguson's work forms therefore a kind of introduction to that of Gibbon on the decline and fall of the empire. Ferguson and his contemporary, the French Abbé Auger, were foremost among those who, previous to Niebuhr, investigated the internal working of the institutions of the Roman republic. [AUGER.] In 1784 Ferguson resigned his professorship on account of ill health, and was succeeded by Dugald Stewart. In 1792 he published 'Principles of Moral and Political Science, being chiefly a retrospect of lectures on ethics and politics, delivered in the College of Edinburgh,' 2 vols. 4to. In this work the author takes a comprehensive review of the various systems of ethics antient and modern, especially with respect to moral approbation, public security, and individual happiness. Another work of Dr. Ferguson's on the same subject, though a more elementary one, the 'Institutes of Moral Philosophy,' which he first published in 1769, has been often reprinted and translated into foreign languages, and has also been adopted as a text-book in some foreign universities. Ferguson died at St. Andrews in February, 1816, being above 90 years of age. He had been on terms of friendship with Hume, Robertson, Adam Smith, Dugald Stewart, Playfair, and other distinguished contemporaries. His mind was independent, and his frankness and honest adherence to his opinions are said to have stood in the way of his advancement.

FERGUSON, or FERGUSSON, ROBERT, was born at Edinburgh about the year 1750, and educated at the University of St. Andrew's, where he received some encouragement from one of the professors named Wilkie, who employed him to transcribe his lectures. An anonymous biographer (Life prefixed to Ferguson's Poems, edition of 1807) has employed considerable research in discovering certain freaks of a kind neither ludicrous nor in good taste, in which he appears to have indulged during his residence at St. Andrew's; one of these was near being the cause of his expulsion; but the sentence was recalled, and he remained as it appears for four years, during which time he subsisted on a bursary or exhibition founded by a person of his own name. On leaving St. Andrew's, he paid a visit to an uncle from whom he had expectations of employment, but after a few months left his house under circumstances of which his anonymous biographer gives a very unsatisfactory account. During the remainder of his life he was employed in the office of the commissary-clerk of Edinburgh, with the exception of a few months spent in that of the sheriff-clerk; and was a constant contributor to Ruddiman's 'Weekly Magazine,' from which his poems were afterwards collected. The local celebrity which these productions obtained for him gave him so frequent opportunities of convivial and other excess as to ruin his health, and terminate his life at the early age of twenty-four years. His last days were passed in a mad-house, his debauchery having ended in repentance which took the form of melancholy, and ultimately that of insanity.

Ferguson's poems are written partly in English and partly in Lowland Scotch. Those in Lowland Scotch have been admired by persons conversant with the idiom in which they

are written; but to an English ear they want the charm which makes Burns not the less sweet because he is sometimes not intelligible. There is a coarseness and clumsiness about Ferguson's, which render it wonderful how their author could have ever succeeded in gaining reputation as a poet. In praise of his English verses, a little more may be said; but we suspect that the similarity of his life to that of Chatterton created an interest about him to which most, if not all of his celebrity is owing.

His life has been written by Irving (Glasgow, 1799: reprinted in 1805), and by an anonymous author who dedicates his sketch to James Grahame, esq. This latter production contains more specimens of bombast and bad taste than are usually found in the space of eighty pages, and serves by its tone of panegyric to reproduce exactly those prejudices which it was intended to repress.

(Chalmers's *Biogr. Dict.*; and *Biographie Universelle*, vol. xiv.)

FERGUSONITE, a crystallized mineral, which is principally a columbate of yttria. It has been found only in Greenland, near Cape Farewell, imbedded in quartz.

Primary form a square prism. Colour brownish-black. Opaque, except in the splinters. Lustre slightly metallic. Specific gravity 5·838. Hardness 5·5, 6·0. Streak pale brown. Fracture conchoidal. Before the blow-pipe becomes of a greenish-yellow, and does not fuse, but with a phosphate it dissolves completely. According to Hartwall, this mineral consists of

Oxide of columbium	47·75
Yttria	41·91
Zirconia	3·02
Oxide of cerium	4·68
" tin	1·00
" uranium	0·95
" iron	0·34
	99·65

FERISHTA (Mohammed Kasim), a celebrated Persian historian, was born at Astrabad, on the border of the Caspian Sea, in A. D. 1570. His father, whose name was Gholam Ali Hindoo Shah, and who appears to have been a learned man, left his native country when Ferishta was very young and travelled into India. He finally settled at Ahmudnugger, in the Deccan, during the reign of Murtuza Nizam Shah, and was appointed to instruct Mîran Hossein, the son of Murtuza, in the Persian language, but he died soon after this appointment. Mîran Hossein however patronized his son Ferishta, and through his influence the historian was advanced to high honours in the court. When Murtuza was assassinated, Ferishta, who was then only seventeen years of age, was captain of the royal guard.

In the troubles following the death of Murtuza, Ferishta left Ahmudnugger, A. D. 1589 (see the preface to his history), and went to Bejapore, where he was kindly received by the regent and minister, Dilawur Khan, who introduced him to Ibrahim Adil Shah II., the reigning monarch. In this court he spent the remainder of his life in high honour, engaged sometimes in military expeditions, as we learn from his own history, and devoting his leisure time to the composition of his great work. He died, in all probability, soon after A. D. 1611, at the age of forty-one. He makes mention in his history of the English and Portuguese factories at Surat, A. D. 1611.

The preceding account has been chiefly taken from the English translation of Ferishta, by Colonel Briggs, which was published in London, 1829, in 4 vols., 8vo. Portions of the history had been previously translated. Colonel Dow published a translation of the first two books in his 'History of Hindostan,' 2 vols., 4to., London, 1768, which is not considered to be very accurately done. A much better translation of the third book was given by Mr. Jonathan Scott in his 'History of the Deccan,' 2 vols., 4to., 1794. Mr. Stewart, in his 'Descriptive Catalogue of the Library of the late Tippoo Sultan of Mysore,' gives an account of the contents of the history, p. 12; and also a translation of part of the tenth book, accompanied with the original Persian, pp. 259—267.

The history of Ferishta is divided into twelve books, with an introduction, which gives a brief and imperfect account of Hindoo history before the time of the Mohammedans, and also a short account of the conquests of the Arabs in their progress from Arabia to Hindostan. The first book contains an account of the kings of Ghizni and Lahore, A. D. 977—1186. Here the detailed portion of his history begins. 2nd, The kings of Delhi, A. D. 1205 to the death of Akber, 1605; 3rd, The kings of the Deccan, A. D. 1347—1596; 4th, The kings of Guzerat; 5th, The kings of Malwa; 6th, The kings of Kandeish; 7th, The kings of Bengal and Behar; 8th, The kings of Multan; 9th, The rulers of Sind; 10th, The kings of Cashmir; 11th, An Account of Malabar; 12th, An Account of the European Settlers in Hindostan. At the conclusion of the work, Ferishta gives a short account of the geography, climate, and other physical circumstances of Hindostan.

Ferishta is certainly one of the most trustworthy of oriental historians. He seems to have taken great pains in consulting authorities. At the close of his preface he gives a list of thirty-five historians to whom he refers, and Colonel Briggs mentions the names of twenty more who are quoted in the course of the work. 'What is really remarkable in this writer,' says Colonel Dow, 'is, that he seems as much divested of religious prejudices as he is of political flattery or fear. He never passes a good action without conferring upon it its due reward of praise, nor a bad one without stigmatizing it with infamy.'

FERMANAGH, an inland county of the province of Ulster, in Ireland: bounded on the north west, north, and north-east by the counties of Donegal and Tyrone; on the east by the county of Monaghan, and on the south and south-west by the counties of Cavan and Leitrim. The greatest length from the boundary of Donegal towards Ballyshannon on the north-west, to Shankill Loch, on the borders of Monaghan, on the south-east, is 45 statute miles; the breadth, from Cuilcagh mountain, on the borders of Cavan, on the south-south-west, to Tappaghan mountain, on the borders of Tyrone, on the north-north-east, is 29 statute miles. The area, according to the Ordnance Survey map, consists of—

	A.	R.	P.
Land	409,783	1	12
Water	46,748	1	2
Total	456,531	2	14

Of this extent of water 36,348 acres and 21 perches are included in the upper and lower lakes of Loch Erne, which lie almost wholly within this county. [ERNE, LOUGH.] The gross population of Fermanagh in 1831 was 149,763.

Fermanagh is divided into two nearly equal portions by the line of Loch Erne, which passes through it diagonally. The portion lying south of the upper or western sheet of Loch Erne contains a large tract of waste and mountain, of the same character with the extensive highland districts of Leitrim and Cavan, on which it borders. This tract is bounded on the south by the lakes of Loch Melvin and Upper and Lower Loch Macnean; the waters of the first of which flow westward to the Atlantic, and of the two latter, eastward by the Arney river into Upper Loch Erne. The chief elevations of this tract on the north are, beginning from the west, Glennalong, 793 feet; Tiranagher, 875 feet; Bolusty, 1064 feet; Shean North, 1175 feet; Shean East, 1030 feet; and Blackslee, 1026 feet; which overhang the shore of Upper Loch Erne in a continuous range. More central are Drumbad, 1009 feet; Knockmore, 919 feet; Glenkeel, 1223 feet; and Belmore, 1312 feet; and on the south Slapragh, 846 feet; Ora More, 854 feet; and Aghamore, 1249 feet. The whole of this district abounds with small lakes, and is traversed by numerous ridges running generally in a direction from east to west. It is particularly remarkable for the number of cavities and subterranean channels which occur throughout the limestone and sandstone rocks of which it is composed. The Roogagh river, which brings down the waters of several small lakes and tributary streams to Loch Melvin, is absorbed in the rock, and emerges, after running a distance of about thirty perches underground. In like manner, several brooks running into Loch Erne from the range of Shean North and Blackslee, dip underground in their course. A natural bridge of rock crosses a stream which forms part of the boundary of the district on the south; and throughout the central parts caves and deep holes in the rock are of very frequent occurrence. On the east this rough tract slopes down to a well-cultivated district extending from Enniskillen along the neck of Loch Erne and up the valley of the Silees and Arney rivers. South of the latter river rises the mountain of Cuilcagh to a height of 2188 feet, being the highest ground in the county. This neighbourhood is distinguished by the same characteristics—holes in the rock, caverns, and

natural arches—which mark the more extensive mountain district. Three streams, descending from Cuilcagh, sink into different cavities of the rock, and after flowing nearly a mile each underground, re-issue in a single river, called the Claddagh, a feeder of the Arney. At the foot of Cuilcagh is situated Florence Court, a noble seat of the earl of Enniskillen; and generally throughout the tract from Loch Macnean to Enniskillen, and thence along the left bank of the lake, the seats of resident proprietors are numerous and highly respectable. The remainder of that part of the county which lies south of Loch Erne is low, and cultivated.

The district to the north of the Upper Lake is not diversified by many eminences: the chief are Glenvannan, 730 feet; and Tappaghan, 1110 feet. Towards Enniskillen there are numerous and well-improved seats of proprietors; and close to the town is Castle Coole, the residence of the earl of Belmore, which is generally considered the most splendid residence in the modern style in Ireland. Tossid mountain, 909 feet in height, rises north-east of Enniskillen, and from its situation in a comparatively flat district, commands a very extensive and picturesque prospect. From Enniskillen to Upper Loch Erne the winding river is occupied on each side by demesnes and other improved lands; the upper lake, containing an immense number of wooded islands, is highly beautiful; the domesnes of Bellisle and Crum Castle terminate it at each extremity. The remainder of the county north of the upper lake is chiefly arable, and has a numerous and industrious population. The only towns of any consequence in the county besides Enniskillen and Irvinestown lie in this district, viz. Newtown Butler, Lisnaskea, Maguire's Bridge, Lisbellaw, and Tempo.

The rivers of Fermanagh are small. From the mountainous district on the south-west, the Silees and Arney run into Loch Erne: the Cladagh or Swanlinbar river flowing south-east of Cuilcagh has a like termination. The Woodford, which separates Fermanagh from a part of Cavan, is the largest river which discharges itself into Loch Erne within the bounds of this county. The Drumany or Colebrook river, one branch of which passes by Tempo, is the only considerable stream that flows into the lake from the north.

The climate is somewhat cold and moist: violent winds are common in winter, and render the navigation of the lake dangerous.

There has not hitherto been anything published on the subject of the geology of this part of Ireland. Limestone occurs throughout the mountainous district, and in the islands of Loch Erne. The general character however of this part of the county is understood to be the same with that of the Loch Allen coal district, of which sandstone and grit are the principal constituents. The remainder of the county would appear to belong to the greywacké formation.

The soil for the most part is naturally cold and moory, but has been brought into a good state of productiveness throughout the arable districts. Timber is generally of a good growth: at Florence Court in particular the timber is very large. As the condition of the peasantry in Fermanagh is better than in the neighbouring counties, and the potato does not constitute the whole of their food, the sales of grain at the local markets appear comparatively small. The following are the returns for 1835:—

	Wheat. Tons.	Oats. Tons.	Barley. Tons.	Rye. Tons.	Bere. Tons.	
Enniskillen .	26¼	1,355	..	50¼	408	Market increasing
Irvinestown .	..	90	..	..	..	„ stationary.

Fermanagh is divided into eight baronies, viz., Lurg on the north, containing the rising town of Irvinestown, population 1047; Tyrkennedy on the north-east, containing part of Enniskillen, total population 6056; and the village of Lisbellaw, population 242; Magherastephana on the east, containing the town of Maguire's Bridge, population 854; and the village of Lisnaskea, population 430; Clankelly, also on the east; Coole on the south-east, containing the village of Newtown Butler, population 412; Knockinny on the south; Clanawley or Glenawley on the south-west; and Magheraboy on the west.

The linen manufacture is carried on to some extent, but does not form any considerable branch of commerce. The fair of Maguire's Bridge is much frequented by purchasers of horses and young cattle. Still Fermanagh cannot be said to have any staple or brisk trade. The produce of the county is, in a great measure, consumed within it; and the absence of external traffic is perhaps in this case an evidence of the comfort of the people.

Table of Population.

Date.	How ascertained.	Houses.	Families.	Families chiefly employed in agriculture.	Families employed in trade, manufactures, and handicraft.	All other families not comprised in the two preceding classes.	Males.	Females.	Total.

Fermanagh was first erected into a county by statute of the 11th of Elizabeth; but it was not till the time of the plantation of Ulster that it was finally brought under civil government. Having fallen to the crown by the attainder of Maguire, it was divided in like manner with the other five escheated counties among Scottish and English undertakers and native Irish. The precincts or baronies of Knockinny and Maghenaboy were allotted to Scottish undertakers; those of Clankelly, Magherastephana, and Lurg, to English undertakers; and those of Clanawley, Coole, and Tyrkennedy, to servitors and natives. The chief proprietors under the new settlement were the families of Cole, Blennerhasset, Butler, Hume, and Dunbar. The subsequent forfeitures of 1641 affected a large portion of Fermanagh, and considerably increased the possessions of those from whom many of the present proprietors are descended. The forfeitures consequent on the war of the Revolution affected only 1945 acres in this county, valued at 389*l.* per annum. [ENNISKILLEN.]

Fermanagh returns three members to the Imperial Parliament, viz., two for the county, and one for Enniskillen, the assize town, which is the only borough or corporate town within this county.

The public expenses of the county are defrayed by grand jury presentments: the amount so levied in the year 1829 was 18,832*l.* 14*s.* 3½*d.* The constabulary force employed in Fermanagh in the year 1835-6, consisted of 5 chief constables, 21 constables, 86 sub-constables, and 4 horses; the cost of which establishment was 4734*l.* 8*s.* 5*d.*

There has not been any statistical survey of Fermanagh published.

(*Ordnance-Survey Map of Fermanagh*; Harris's *Hibernica*; Inglis's *Ireland in 1834*.)

FERMAT, PIERRE DE, was born at Toulouse in 1595, and was brought up to the profession of the law. We have but few incidents of his private life, except that he became a counsellor of the parliament of his native town, was universally respected for his talents, and lived to the age of seventy years. His works were published in 1670 and 1679, in folio: the last volume contains his correspondence, besides some original scientific papers.

Fermat restored two books of Apollonius, and published

Diophantus, with a commentary. The whole of the actual works of Fermat fill an exceedingly small space; nevertheless they contain the germs of analytical principles which have since come to maturity. In fact they may be regarded, generally speaking, as announcements of the results to which he had arrived, without demonstrations, or any indications of the processes employed.

The properties of numbers were the subject of his enthusiastic researches, and no single individual has added more that is both curious and useful to this branch of mathematics than Fermat: the theorem now commonly called Fermat's is but a particular case of a much more general one given in his works.

His method for finding Maxima and Minima has only the merit of a moderate ingenuity, before the differential calculus was discovered; the analysts of that day hovered on the brink of that beautiful process of analysis which has been rather ridiculously termed the greatest discovery of the human mind. A method not very remote from Fermat's was practised by other analysts of his day; and in spirit also by the antient geometers: but it certainly is not the differential calculus, and Laplace has no ground for his attempt to snatch from the claims of the English and German nations this grand step of analysis in order to appropriate it to his own.

In Fermat's correspondence with Father Mersenne, we find him, in a bungling manner, contesting with Roberval the first principles of mechanics, and maintaining that the weight of bodies is least at the surface of the earth, increasing both within and without, which is the direct opposite to the truth: and in one of his letters, when greeted by Mersenne with the retractation of his errors, he very disingenuously attempts to deny them, asserting that no body has a centre of gravity, with many similar trifles, which place in bold relief the immortal discovery of Sir Isaac Newton of the law of universal attraction, and add lustre to his predecessor Galileo, who escaped from similar paradoxes, from which common sense ought to have guarded both Fermat and Descartes.

The correspondence of Fermat is sufficiently replenished with vanity, which was also well fed by some of his compatriots, who lauded his propositions as the finest things which had ever been discovered. But it is justly suspected that the discovery of many of his properties of numbers was effected by a tentative process, he himself possessing no demonstration, as no vestige remains in the works published by his son of any peculiar analysis for arriving at them; while there are abundant proofs that he and Frenacle, a young Parisian, employed the methods of tabulation and trial, to suggest properties, and by further trials, observe if they could generalize them. In a subject less barren than the theory of numbers this talent and industry would have produced more useful results; for what are the theorems of Fermat to the laws of Kepler?

Fermat conjectured that the path of light, in passing from air to a denser medium, ought to be such as to describe the shortest possible course. This is a particular case of the principle of least action, and requires some remark. First, we see that Fermat's method for finding maxima and minima was not the differential calculus, for though importuned from various quarters to try this principle he was deterred, as he says himself, for two or three years, by the dread of the asymetries of the process, though any tyro acquainted with the first principles of the differential calculus, with the proper data given, would now do it in five minutes: when Fermat at last did this, it was in a geometrical manner. Secondly, during the life of Descartes, he seems to have disbelieved this law of refraction. The foundations of both their reasonings in natural philosophy were of the slenderest description, if indeed we can at all use such a term as reasoning to the methods of Descartes, whose followers had the greatest faith when he employed the least of that useful faculty. But the law is truly attributable to Snellius, and, though this is well known, many French writers still ridiculously talk of the Cartesian law of refraction. Thirdly, Fermat did not attribute the truth of the principle to any mechanical laws, of which he seems to have known nothing, but to the pseudo-physical principle that nature should take the shortest course in performing its operations—for which, indeed, he was subjected to several cases of objection, to which he has given good answers, considering the position in which such an hypothesis placed him.

To give a more exact idea of the man, we shall give one of his problems, entitled 'Problem by P. de Fermat. To Wallis, or any other mathematician that England may contain, I propose this problem to be resolved by them.

'To find a cube number which, added to its aliquot parts, will give a square number? Example 343.

'If Wallis and no English mathematician can solve this, nor any analyst of Belgic or Celtic Gaul, then an analyst of Narbonne will solve it.'

Wallis gives an account of this in the *Commercium Epistolicum*, the correspondence having been conducted through Sir Kenelm Digby. The works of Fermat contain also the tangents to some known curves, and some centres of gravity.

Though thus strongly endowed with the faculty of self-esteem, and of that cunning which seeks to hide the tracks of discovery, we must still place Fermat among such men as Pascal, Barrow, Brouncker, Wallis; but he had none of the masculine mind of Descartes, nor a particle of the penetrating spirit of the glory of his age and nation, Newton.

It would be wrong to omit here the most curious of the theorems of Fermat relative to numbers. To make it more generally intelligible we may state, that a triangular number means the sum of any number of terms from the first of the natural numbers 1, 2, 3, 4, 5, &c.; thus 1, 3, 6, 10, &c., are triangular numbers; the square numbers are 1, 4, 9, 16, &c., and are the sums of the progression 1, 3, 5, 7, &c.; pentagonal numbers in like manner are the sums of the numbers 1, 4, 7, 10, &c., viz., 1, 5, 12, 22, &c. The theorem consists in this, that *every number* is the sum of 1, 2, or 3 triangular numbers; every number is the sum of 1, 2, 3 or 4 square numbers, and so on. In the works of Euler, Legendre, and Barlow, the demonstrations of the first two cases may be found; and though Legendre and Cauchy have both laboured to prove it more generally, yet our present impression (not having Cauchy's work at hand) is that the general theorem is still without proof.

FERMENTATION denotes the spontaneous changes which occur in certain vegetable and animal matters, and by which there are produced new fluid and gaseous compounds. Fermentation is of three kinds: the *vinous*, producing alcohol; the *acetous*, yielding vinegar; and the *putrefactive*, of which the products are very variable, and usually fetid.

When the expressed juice of grapes is exposed in warm weather to the air, which is necessary to the operation, it soon becomes turbid, its temperature rises a few degrees, a motion occurs in the fluid, and minute bubbles of air form and break. As the process goes on, a thick froth, consisting of these bubbles and viscid matter, rises to the surface; and when these bubbles have burst, a viscid substance falls to the bottom of the vessel: this possesses the property of causing fermentation to take place in other fluids, which, without its presence, would not undergo such a change. this substance is called *yest*. [YEST.]

In order to observe what happens during this *vinous* fermentation, dissolve some sugar in four times its weight of water, and add the solution to a small quantity of fresh yest, obtained as above described or from the fermentation of beer. Expose this mixture, in a flask with a bent tube and a bottle for receiving the gaseous products, to a temperature of about 75°; it will soon be found that the substances will so act upon each other as to produce carbonic acid, which will be found in the gas-bottle, while the sugar will gradually disappear, and the flask will contain a mixture of water and spirit, or alcohol; this is separated by distillation. These changes occur without the interference of the air or its oxygen; nor does it appear that water is decomposed, or that anything is added by the yest; it seems therefore that when sugar is deprived of oxygen and carbon, in the form of carbonic acid, it is converted into alcohol. Now alcohol consists of 3 equivalents of hydrogen = 3, 2 equivalents of carbon = 12, and 1 equivalent of oxygen = 8; its equivalent is therefore 23. In order then that alcohol and carbonic acid alone should be produced from sugar, this last substance must consist of 3 equivalents of hydrogen = 3, 3 equivalents of carbon = 18, and 3 equivalents of oxygen = 24, giving 45 as its equivalent. On this admission, the production of alcohol by the separation of carbonic acid from sugar may be thus shown:—

	Hydrogen.	Carbon.	Oxygen.	
Sugar . . .	3	3	3	equivalents.
Carbonic acid .	0	1	2	,,
Alcohol . . .	3	2	1	,,

This would however show that sugar contains a larger quantity of carbon than is usually assigned to it. According to Gay Lussac, 100 parts of sugar should yield 48·76 of carbonic acid and 51·34 of alcohol, which is very nearly in accordance with the above theoretic statement.

Although sugar appears to be the only vegetable matter which yields alcohol by its decomposition, yet it is to be observed that pure sugar suffers no fermentation. In the juice of the grape, as well as in some other cases, there is some accompanying matter which acts as a ferment; and when yest is thus spontaneously produced it causes fermentation in sugar, without, as far as appears, adding anything important; indeed it is stated that scarcely two per cent. of this substance suffer decomposition. It would therefore almost appear to produce the effect by what has been termed *an action of presence*, and by Berzelius denominated *catalysis*.

In brewing and distilling, and in vinegar-making in this country, the substance fermented is malt, in which the starch that the grain contains has by incipient vegetation been converted into sugar, and thus rendered fermentible.

In the *acetous* fermentation the materials employed are similar to those used for the vinous; but the temperature employed is higher. Little acetic acid is produced unless atmospheric air be present, the oxygen of which may combine directly with the requisite proportions of oxygen and carbon to constitute acetic acid; but as alcohol may be converted into vinegar, as indeed is practised in wine countries, it is possible, even when vinegar is produced from malt, that the previous formation of alcohol may occur; and this view will best explain what happens, and show that by the mere absorption of oxygen so as to form water, and without the evolution of any carbonic acid, acetic acid may be formed: thus—

	Hydrogen.	Carbon.	Oxygen.
Two equivalents of alcohol	= 6	4	2 equivalent
One equiv. of acetic acid	= 3	4	3 ,,
Hydrogen in excess . .	= 3		1 eq. deficient.
Absorb of oxygen . .	= 3		1 eq. absorbed = 4.
And form of water . .	= 3		

The above shows that by exposing 2 equivalents of alcohol to the air, and by the absorption of 4 equivalents of oxygen, there are formed 1 equivalent of acetic acid and 3 equivalents of water, while the 4 equivalents of carbon remain entirely in the acetic acid produced. [ACETIC ACID.] The constitution of acetic acid is then 3 equivalents of hydrogen = 3, 4 equivalents of carbon = 24, and 3 equivalents of oxygen = 24, giving 51 as its representative number.

With respect to the *putrefactive* fermentation, it is to be observed that it is the spontaneous decay and decomposition of vegetable and animal matter, which is unaccompanied with the production of alcohol or acetic acid. In vegetable putrefactive fermentation the principal product is carbonic acid, and probably water, both derived from the absorption of the oxygen of the air, which unites with the hydrogen and carbon of the vegetable matter. In the putrefactive fermentation of animal matter ammonia is a very usual product, owing to the presence of azote, which enters largely into the composition of animal matter in general, and thus, by uniting with the hydrogen, the alkali just mentioned is produced.

FE'RMO ED A'SCOLI, is the name of a Delegazione or province of the Papal State, east of the Apennines, bounded on the east by the Adriatic, on the north and north-west by the province of Macerata, on the west by the province of Spoleto, and on the south by the Abruzzi. It forms part of the old province of the Papal State called the Marches, the antient Picenum, which is now subdivided into three provinces, Ancona, Macerata, and Fermo. The province of Fermo is hilly, being occupied by various offsets of the Apennines, which, detaching themselves from the central ridge extend to the coast of the Adriatic, and form numerous valleys watered by rivers or rather torrents, the principal of which are, from north to south, the Chienti, the Tenna, the Aso, the Tesino and the Tronto. The length of the province along the Adriatic coast is 30 miles, and its breadth from the sea to the central Apennines is about the same. The area is about 1070 English square miles and its population 160,000 inhabitants. (Calindri, *Saggio Statistico dello Stato Pontificio*; Neigebaur, *Gemälde Italiens*.) The chief produce of the country consists in corn and cattle; wine and oil are also made. The principal towns are—1st, ASCOLI with 12,000 inhabitants; 2nd, Fermo, a pleasant town and a bishop's see, built on high ground, about four miles from the sea, and surrounded by old walls and ditches, with several churches and convents, and 6000 inhabitants, who carry on some trade by means of the neighbouring small harbour called Porto di Fermo. The exports are chiefly corn and wool. The antient Firmum, a town of the Piceni, afterwards a Roman municipium, was destroyed in the fifth century by Alaric, and the present town was rebuilt near its ruins. 3rd, Sant 'Elpidio, near the mouth of the river Tenna, has 3000 inhabitants. 4th, Ripatransone, a walled town about five miles from the coast and near the Tesino, has 2000 inhabitants. 5th, Grottamare, a thriving town on the coast near the site of Cupra Maritima, an antient Etruscan colony, carries on some trade by sea, has some sugar refineries, and about 4000 inhabitants. Pope Sixtus V. was born in this place. 6th, Offida, on a hill south of the Tesino, has a handsome collegiate church, some manufactories of lace, and about 3000 inhabitants. 7th, Montalto, a walled town but decayed, has only 600 inhabitants.

FERMOY, in the parish of Fermoy and barony of Condons and Clongibbons, in the county of Cork, in Ireland, situated on the right bank of the Blackwater, on the great southern road leading from Dublin to Cork, distant from Dublin 112 Irish, or 142 English miles.

Fermoy is quite a modern town, and owes its origin to its late proprietor, Mr. Anderson, the introducer of mail-coach travelling into Munster. This enterprising individual began to build here about the beginning of the present century. The site being of equal importance in a military and in a civil point of view, induced the government to second his design by the erection of very extensive barracks. An act was obtained for providing the town with a police; and various manufactures, including a brewery, paper-mill, and bolting-mill, were set on foot by Mr. Anderson. In the erection of all the buildings a regular design was observed, and hence Fermoy presents an appearance of neatness and uniformity very rare among Irish towns. In 1815 trade in Fermoy was very brisk, but has since materially declined. The manufacture of ale and the purchase of corn are still carried on to a considerable extent, but want of employment is neverthless severely felt.

The appearance of Fermoy is imposing: the town extends on each side of a handsome square, facing the northern end of the bridge. The church, from a design by Hargrave, is much admired: there is also a chapel, and a church of Wesleyan Methodists. The barracks, which are very extensive, occupy the brow of a bold elevation on the opposite side of the river. The surrounding country is rich and diversified, and the number of resident gentry considerable. The place is very important as a military station, and the garrison generally consists of several regiments. The population of Fermoy in 1821 was 6702, and in 1831 was 6976, the garrison included. In the parish of Fermoy there were in 1834 sixteen schools educating 470 males and 294 females. In the Fermoy National School, established Sept. 1833, there is an average daily attendance of 270 young persons. (Townsend's *Statistical Survey of Cork*, Cork, 1815; Inglis's *Ireland in 1834*; *Parliamentary Papers, &c.*)
